¹ Tytler, in his *Life of Kames*, mentions an amusing scene which took place betwixt the scholar and master some time after their separation. When Home was at the height of his celebrity as a barrister, the pedagogue had contrived to amass a sum of money, which he cautiously secured on land. Anxious about the security of his titles, he stalked one morning into the study of his former pupil, requesting an opinion of their validity. The lawyer having carefully examined the several steps of the investment, assumed an aspect of concern, and hoped Mr. Wingate had not concluded the bargain; but Mr. Wingate had concluded the bargain, and so he had the pleasure to listen to a long summary of objections, with which the technical knowledge of his former pupil enabled him to pose the uninitiated. When the lawyer was satisfied with the effect of his art, the poor man was relieved from the torture, with an admonition, which it were to be wished all followers of "the delightful task" would hold in mind: "You may remember, sir, how you made me smart in days of yore for very small offences—now I think our accounts are closed. Take up your papers, man, and go home with an easy mind; your titles are excellent."

an author so comparatively youthful, seems to have attracted much attention from the court and the leading lawyers of the time. It is probable that the hue and arrangement given to the pleadings, now the chief defect of that compilation, may have rendered it at the time it was published attractive from the originality of the method. A small volume of essays *Upon Several Subjects in Scots Law*, which he published four years afterwards, afforded more scope for ingenuity and refinement of reasoning than could possibly be infused into other men's arguments; and in the choice of the subjects, and the method of treating them, full advantage has been taken of the license. Such of the arguments and observations as stood the test of more mature consideration were afterwards embodied by the author in one of his more extensive popular law-books. Mr. Home seems to have been one of those gifted individuals who could enjoy hilarity without dissipation, and gaiety without frivolity. In early life he gathered round him a knot of familiar and congenial spirits, with whom he enjoyed the fashionable and literary society of Edinburgh, then by no means despicable as a school of politeness, and just dawning into a high literary celebrity. Hamilton of Bangour, Oswald, and Lord Binning were among his early and familiar friends, and though he soon extended to more gifted minds the circle of his philosophical correspondence, an early intercourse with men so refined and learned must have left a lasting impression on his susceptible intellect.

In 1741, at the prudent age of forty-seven, Mr. Home married Miss Agatha Drummond, a younger daughter of Mr. Drummond of Blair, in Perthshire, a lady of whom we hear little except that she had a turn for quiet humour, and that she perplexed her husband's economical principles by an inordinate affection for old china, being in other respects generally reported to have been a prudent and docile wife. In 1741 Mr. Home published the well-known *Dictionary of the Decisions of the Court of Session*, afterwards continued and perfected by his friend and biographer Lord Woodhouselee; a very laborious work, and of great practical utility, though now superseded by the gigantic compilation of Morison, and the elaborate digest of the late Mr. Brown. During the rebellion of 1745 the business of the Court of Session was suspended for eleven months, and those lawyers whose minds were not engaged in the feverish struggles of the times, had to seek some occupation in their retirement. Mr. Home seems at no time to have busied himself in active politics, excepting such as came within the range of his judicial duties—and the early predilection of his family to the support of the Stuart dynasty may have been an additional motive for his preserving a strict neutrality during that disorderly period. In the midst of his retirement he gathered into a few short treatises, which in 1747 he published under the title of *Essays upon Several Subjects concerning British Antiquities*, some facts and observations intended to allay the unhappy differences of the period, although it is rather doubtful whether the Highlanders or their intelligent chiefs found any solace for their defeat and subjection to the laws, in discussions on the authority of the *regiam majestatem*, or nice theories of descent. The subjects discussed are of a highly useful and curious nature; and had the author brought to the work an extensive collection of facts, and a disposition to launch into no theories but such as his own good sense dictated to be applicable and sound, the country might have had to thank him for a just and satisfactory account of her ancient laws and customs, and the rise of the constitution, which the

talent of her bar has not yet produced. But these essays are brief and desultory, the facts are few and paltry, and the reasoning fanciful and unsatisfactory. The arguments against "the hereditary and indefeasible right of kings," if they ever produced any good effect, would certainly constitute a proof that the human mind, as exhibited in any arguments which might be used by his opponents, was then more perverted by prejudice than it is generally believed to have been in any civilized country. To the truisms contained in that essay, the refinements on hereditary descent form a curious converse; where the feudal system has its origin from the tendency of bodies in motion to continue in a straight line, and the consequent tendency of the mind to pursue its objects in a course equally direct, which proves that "as in tracing out a family, the mind descends by degrees from the father first to the eldest son, and so downwards in the order of age, the eldest son, where but one can take, is the first who presents himself."

The next production of Mr. Home's pen was one of a nature more congenial to his habits of thought:—in 1751 he published *Essays on the Principles of Morality and Natural Religion*. One of the grand leading aims of this work is the maintenance of innate ideas, or principles of right and wrong, in opposition to the opinions of Locke and Hume. After the clear logical deductions of these great men, the duty of an opponent was a task of difficulty; while it is at the same time generally allowed by both parties in this grand question, that the view adopted by Lord Kames, while it agrees more happily with the general feelings of the world, cannot bear the application of the same chain of clear and subtle reasoning which distinguishes the position of his antagonists. Like too many of the best works on metaphysics, the *Essays on Morality* give more instruction from the ingenuity of the arguments, and the aspects of the human mind brought before the reader in the course of deducing them, than in the abstract truths presumed to be demonstrated. It has been frequently noticed, to the prejudice of most of the works of the same author, that instead of arranging his arguments for the support of some general principle, he has subdivided his principles, and so failed to bring his arguments to a common point. The failing, if characteristic of Lord Kames, was not unusual at the period, and is one which time and the advantage of the labours of previous thinkers tend to modify. In the work we are just considering, the line of argument maintained bids defiance to the adoption of any one general principle, while much confusion is prevented by the author having given a definition of what he understands those laws of nature to which he refers our consciousness of good and evil to consist of. Although the author in the advertisement avows the purpose of his work to be "to prepare the way for a proof of the existence of the Deity," and terminates the whole with a very pious and orthodox prayer, he had the misfortune to bring the Church of Scotland like a hornet's nest about him, on the ground of certain principles tending to infidelity. A zealous clergyman of the name of Anderson published, in 1753, *An Estimate of the Profit and Loss of Religion, Personally and Publicly Stated; illustrated with References to "Essays on Morality and Natural Religion;"* in which the unfortunate philosopher is treated with no more politeness than the opponent of any given polemical disputant deserves. This blast of the trumpet was followed up by an *Analysis* of the same subject, "addressed to the consideration of the Church of Scotland;" and the parties rousing themselves for battle, the hand of the respected Dr. Blair stretched forth in moderation of

party rancour, and defence of his esteemed friend, protracted but did not prevent the issue. A motion was made in the committee for overtures of the General Assembly, "How far it was proper for them to call before them and censure the authors of infidel books." After a stormy debate the motion was lost, but the indefatigable Mr. Anderson presented, in name of himself and those who adhered to his opinions, a petition and complaint to the presbytery of Edinburgh, praying that the author of the *Essays on Morality, &c.*, might be censured "according to the law of the gospel, and the practice of this and all other well-governed churches." Defences were given in, and the petitioner obtained leave to reply, but before the matter came to a conclusion he had breathed his last, and the soul of the controversy perishing along with him, Lord Kames was left to pursue his philosophical studies unmolested. The chief subject of this controversy may be discovered in the curious and original views maintained by the author of the essays on the subject of liberty and necessity. Full freedom to the will of mankind he maintains to be in opposition to the existence and operation of a Deity, who prejudices all his actions, and has given him certain motives which he cannot avoid following; while, to preserve common uniformity with the doctrine of an innate sense of right and wrong previously maintained, the author is obliged to admit that man must have a consciousness of free-will to enable him to act according to that innate sense: he therefore arrives at a sort of intermediate doctrine, which may be said to maintain that while the will is not in reality free, it is the essence of our nature that it should appear to us to be so. "Let us fairly own," says the author, "that the truth of things is on the side of necessity; but that it was necessary for man to be formed with such feelings and notions of contingency as would fit him for the part he has to act." "It is true that a man of this belief, when he is seeking to make his mind easy after some bad action, may reason upon the principles of necessity, that, according to the constitution of his nature, it was impossible for him to have acted any other part. But this will give him little relief. In spite of all reasonings his remorse will subsist. Nature never intended us to act upon this plan: and our natural principles are too deeply rooted to give way to philosophy." . . . "These discoveries are also of excellent use, as they furnish us with one of the strongest arguments for the existence of the Deity, and as they set the wisdom and goodness of his providence in the most striking light. Nothing carries in it more express characters of design; nothing can be conceived more opposite to chance, than a plan so artfully contrived for adjusting our impressions and feelings to the purposes of life." The doctrine may appear at first sight anomalous; but it displays equal ingenuity in its discovery, and acuteness in its support, and is well worthy of the deepest attention. A certain clergyman of the Church of Scotland is said to have seen in this theory an admirable exposition of the doctrine of predestination, and to have hailed the author as a brother; and certainly a little comparison will show no slight analogy betwixt the two systems; but other persons thought differently, and the reverend gentleman was superseded. These fiery controversies have carried us beyond an event which served to mitigate their rancour—the elevation of Mr. Home to the bench of the Court of Session, where he took his seat in February 1752, by the title of Lord Kames; an appointment which, as it could not be but agreeable and satisfactory to the learned and ingenious, seems to have met the general concurrence and approbation of the common people of the country.

In 1755 Lord Kames was appointed a member of the board of trustees for the encouragement of the fisheries, arts, and manufactures of Scotland, and likewise one of the commissioners for the management of the annexed estates, on both of which important duties it would appear he bestowed the attention his ever-active mind enabled him to direct to many different subjects. In the midst of his varied judicial and ministerial labours, two legal works appeared from the pen of Lord Kames. *The Statute Law of Scotland Abridged, with Historical Notes*, published in 1759, was never known beyond the library of the Scots lawyer, and has now almost fallen into disuse even there. *Historical Law Tracts*, published in 1757, was of a more ambitious sort, and acquired something beyond professional celebrity. The matters discussed in this volume are exceedingly miscellaneous, and present a singular mixture of "first principles" of morality, metaphysics, &c., and Scots law. The author has here displayed in the strongest light his usual propensity for hunting after principles so far back into the misty periods of their origin, that attempting to find the lost traces of the peculiar idea he is following, he pursues some fanciful train of thought, which has just as much chance of being wrong as of being right. "I have often amused myself," says the author, "with a fanciful resemblance of law to the river Nile. When we enter upon the municipal law of any country in its present state, we resemble a traveller, who, crossing the Delta, loses his way among the numberless branches of the Egyptian river. But when we begin at the source, and follow the current of law, it is in that case no less easy and agreeable; and all its relations and dependencies are traced with no greater difficulty than are the many streams into which that magnificent river is divided before it is lost in the sea." If the philosopher meant to compare his searches after first principles to the investigation of the source of the Nile, the simile was rather unfortunate, and tempts one by a parody to compare his speculations to those of one who will discover the navigability or fertilizing power of a river by a confused and endless range among its various sources, when he has the grand main body of the river open to his investigations, from which he may find his way, by a sure and undoubted course, to its principal sources, should he deem it worth his while to penetrate them. This work exhibits in singularly strong colours the merits and defects of its author. While his ingenuity has led him into fanciful theories, and prompted him to attribute to the actions of barbarous governments subtle intentions of policy, of which the actors never dreamed, it has enabled him to point out connections in the history of our law, and to explain the natural causes of anomalies, for which the practical jurisconsult might have long looked in vain. The history of criminal jurisprudence is a prominent part of this work. The author attempts to confute the well-founded theories of Voltaire, Montesquieu, and many others, tracing the origin of punishment, and consequently the true principles of criminal jurisprudence, from the feelings of vindictiveness and indignation inherent in human nature when injured—a principle we fear too often followed to require a particular vindication or approval. We cannot pass from this subject without attracting attention to the enlightened views thrown out by Lord Kames on the subject of entails, views which he has seen the importance of frequently repeating and inculcating, though with many others he spoke to the deaf adder, who heeded not the wisdom of his words. He proposed the entire repeal of the statute of 1685, which, by an invention of the celebrated Sir Thomas

Hope, had been prepared for the purpose of clenching the fetters of Scots entails, in a manner which might put at defiance such efforts as had enabled the lawyers of England to release property from its chains. But the equity of the plan was shown in the manner in which the author proposed to settle the nice point of the adjustment of the claims on estates previously entailed. The regulations enforced by these he proposed should continue in force in as far as respected the interests of persons existing, but should neither benefit nor bind persons unborn at the time of the passing of the act proposed. Such an adjustment, though perhaps the best that could possibly be supposed, can only be put in practice with great difficulty; the circumstance of an heir being expected to be born nearer than any heir alive, and numberless others of a similar nature, would render the application of the principle a series of difficulties. Lord Kames communicated his views on this subject to Lord Hardwick and Lord Mansfield, and these great judges admitted their propriety; it had been well had the warning voice been heeded—but at that period the allegiance of Scotland might have been endangered by such a measure. The Duke of Argyll was then the only Scotsman not a lawyer who could look without horror on an attempt to infringe on the divine right of the lairds.

In 1760 appeared another philosophically legal work from our author's prolific pen, entitled *Principles of Equity*, composed with the ambitious view of reconciling the distinct systems of jurisprudence of the two nations—a book which might be of great use in a country where there is no law, and which, though it may now be applied to but little practical advantage in Scotland, it is rather humiliating to think should have ever been considered requisite as a guide to our civil judges. But the opinions of this volume, which referred to the equity courts of England, received a kindly correction from a masterly hand. In tracing the jurisdiction of the Court of Chancery, Lord Kames presumed it to be possessed of perfectly arbitrary powers (something resembling those at one time enjoyed by the Court of Session), enabling it to do justice according to the merits, in every case which the common law-courts did not reach; and with great consideration laid down rules for the regulation of its decisions, forgetting that, if such rules could be applied to any court so purely arguing from circumstances and conscience, the rules of an act of parliament might have been as well chosen, and rather more strictly followed, than those of the Scottish judge. But it appears that Lord Kames had formed erroneous ideas of the powers of the English equity courts; and in a portion of Sir William Blackstone's *Commentary*, attributed to the pen of Lord Mansfield, he is thus corrected: "On the contrary, the system of our courts of equity is a laboured, connected system, governed by established rules, and bound down by precedents, from which they do not depart, although the reason of some of them may perhaps be liable to objection."

Passing over the introduction to the *Art of Thinking*, published in 1761, we turn with much pleasure to the contemplation of another of the philosophical productions of this eminent writer, the work on which his reputation chiefly depends. In 1762 was published, in three octavo volumes, *The Elements of Criticism*. The correspondence and previous studies of the author show the elaborate and diversified matter of these volumes to have been long the favourite subject of his reflections. It had in view the aim of tracing the progress of taste, as it is variously exhibited and acknowledged to exist, to the organic principles of the mind on which, in its vari-

ous departments, it is originally founded, displaying the art of what his biographer justly calls "philosophical criticism," in opposition to that which is merely practical, or applicable to objects of taste as they appear, without any reference to the causes why the particular feelings are exhibited. But that Lord Kames was in this "the inventor of a science," as his biographer has termed him, is a statement which may admit of some doubt.

The doctrine of reflex senses propounded by Hutcheson, the father of the Scottish system of philosophy, had many years previously laid a firm foundation for the system afterwards so ably erected. Some years previously to the publication of the *Elements of Criticism*, Hume and Gerard had drawn largely from the same inexhaustible source, and, if with less variety, certainly with more correctness and logical accuracy of deduction; and Burke, though he checked the principle of the sensations he has so vividly illustrated by arbitrary feelings assigned as their source, contributed much to the advancement of that high study. Nor is it to be denied that the ancients at least knew the existence of this untried tract, if they did not venture far within its precincts, for few can read *Cicero de Oratore*, Longinus, or the *Institutions* of Quintilian, without perceiving that these men were well acquainted with the fundamental principles of the rules of criticism. But relinquishing the discussion of its originality, the *Elements of Criticism* is a book no man can read without acquiring many new ideas, and few without being acquainted with many new facts: it is full of useful information, just criticism, and ingenious reasoning, laying down rules of composition and thought which have become classical regulations for elegant writers. The author is, however, a serious transgressor of his own excellent rules; his mind seems to have been so perpetually filled with ideas, that the obstruction occasioned by the arrangement of a sentence would cause a considerable interruption in their flow; hence he is at all times a brief, unmelodious composer, and the broken form of his sentences frequently renders their meaning doubtful. It has been said, and not without reason, that the critical principles of Lord Kames are more artificial than natural, more the produce of refined reasoning than of feeling or sentiment. The whole of his deductions are indeed founded on the doctrine of taste being increased and improved, and almost formed, by art, and his personal character seems not to have suggested any other medium for his own acquisition of it. The *Elements of Criticism* had the good fortune to call forth a little of the virulence of Warburton, who seems to have complacently presumed that Lord Kames composed his three thick volumes with the sole and atrocious aim of opposing some of the theories of the learned divine; and Voltaire, celtifying the author by the anomalous name of *Makains*, has bestowed on him a few sneers, sparingly sprinkled with praise, provoked by the unfortunate Scotsman having spoken of the *Henriade* in slighting terms, and having lauded Shakspeare to the prejudice of the French drama.

In April, 1763, Lord Kames was appointed a lord of justiciary in the criminal court of Scotland. Surrounded by judicial duties and immersed in professional and literary studies, he was still an active supporter of the useful institutions which he had some time previously joined, investigating, along with the celebrated Dr. Walker, the proper grounds for improving the cultivation and manufactures of the Western Isles and the more remote parts of Scotland. In 1766 a new field was opened for his exertions by his succession, through the death of his wife's brother, to the extensive estate of Blair-Drum-

mond, which made him a richer but not a more illustrious man. The chief circumstance which renders this accession to his fortune interesting to the world, is the commencement of a vast system of improvement, by floating into the Firth of Forth the surface of a moss, extending over portions of his own and many contiguous estates, and shrouding what cultivation has made, and is still making, the finest land in Scotland. The next issue from the pen of Lord Kames were a small pamphlet on the *Progress of Flax Husbandry in Scotland*, published in the year 1765, and in the ensuing year a continuation of his *Reasonable Doubts* from 1739 to 1752. He now began to approach that age which has been marked out as a period reached by a small proportion of the human race; but though stricken in years, and pressed upon by official duties, he did not flinch from a new and elaborate undertaking on a subject of many diversified branches—some of which were totally disconnected with his previous literary labours. Lord Kames appears to have had his mind perpetually filled with the matter he was preparing to discuss, and to have constantly kept open to the world the engrossing matter of his thoughts; it is thus that, for some time previously to the publication of his *Sketches of the History of Man* (which appeared in 1774), we find an ample correspondence with his literary friends—with Dr. Walker, Sir James Nasmith, Dr. Reid, and Dr. Black, affording some most interesting speculations on the gradations of the human race, and the analogy between plants and animal subjects—which had long been speculated upon by our author. On these branches of philosophy he has bestowed considerable attention in the *Sketches of the History of Man* to little satisfaction. In reasoning *a priori* from the history of man in the world, and the various aspects of his tribe, the author erects a system in opposition to that of revelation, to which, however, he afterwards yields as to the authority of the court, allowing it to be true, not by any means from the superiority of the system to his own, but because holy writ has told it. But if the work be hereafter perused, to gratify an idle hour with its amusing details, few will search in it for much information on a subject which has received so much better illustration from Blumenbach, Pritchard, and Lawrence. But the subjects of these sketches are multifarious; Ossian's poems are ingeniously introduced as part of the history of man, constituting a sort of barbaro-civilized period, when probably the same amount of polish and of rudeness which still exists held sway, though without neutralizing each other, and both displayed in the extreme; government is also discussed, and finances. The political economy is old and narrow, looking upon national means too much in the light of an engine to be wielded rather than as a self-acting power, which only requires freedom and room to enable it to act; nevertheless, it is sprinkled with enlightened views, such as the following:—"It appears to be the intention of Providence, that all nations should benefit by commerce as by sunshine; and it is so ordered that an unequal balance is prejudicial to the gainers as well as to the losers: the latter are immediate sufferers; but not less so ultimately are the former."

In his latter days the subject of our memoir produced four more extensive works, of which we shall only mention the names and dates:—*The Gentleman Farmer*, in 1776; *Elucidations respecting the Common Law of Scotland*, in 1777; *Select Decisions of the Court of Session from 1752 to 1768*, published in 1780; *Loose Hints on Education*. The last of his works was published in 1781, in the eighty-fifth year of the author's age, a period when the weakness of the body

cannot fail to communicate itself to the thoughts. The green old age of Lord Kames seems to have been imbittered by no disease but that of general decay. He continued his usual attention to the agricultural and manufacturing projects of the country; gratified his few leisure hours in the society of his select literary friends; attended the Court of Session, and even performed the arduous duty of travelling on the circuits: he was indeed a singular specimen of a mind whose activity age could not impede. His correspondence continues till within a short time of his death, and before leaving the world he could spare some consideration for assisting in the establishment of an institution, the pleasures and profits of which could not be reaped by him—the Royal Society of Scotland. During his short and last illness he expressed no dread except that he might outlive the faculties of his mind; to the usual solicitations, which friends can never avoid making on such occasions, that he would submit himself to the care of a physician—"Don't talk of my disease," he answered, "I have no disease but old age. I know that Mrs. Drummond and my son are of a different opinion; but why should I distress them sooner than is necessary. I know well that no physician on earth can do me the smallest service: for I feel that I am dying; and I thank God that my mind is prepared for that event. I leave this world in peace and goodwill to all mankind. You know the dread I have had of outliving my faculties; of that I trust there is now no great probability, as my body decays so fast. My life has been a long one, and prosperous, on the whole, beyond my deserts: but I would fain indulge the hope that it has not been useless to my fellow-creatures."

A week before he died Lord Kames took a final farewell of his old friends and professional companions, on that bench to which he had been so long an ornament. He parted from each as a private friend, and on finally retiring from the room, is said to have turned round on the sorrowful group and bid his adieu in an old favourite epithet, more expressive of jovial freedom than of refinement. He died on the 27th of December, 1782, in the eighty-seventh year of his age. We have narrated the events of his life with so much detail, that a summary of his character is unnecessary; he is said to have been parsimonious, but if the epithet be applicable, the private defect will be forgotten in the midst of his public virtues. He possessed the dangerous and powerful engine of sarcasm; but he used it to heal, not to wound. The following instance of his reluctance to give pain, to be found in a letter to Mr. Creech, is so characteristic of a truly worthy man, that we cannot abstain from quoting it. "In the fifth volume of Dodsley's collection of poems there is one by T— D—, at page 226, which will make a good illustration of a new rule of criticism that is to go into the new edition of the *Elements*; but, as it is unfavourable to the author of that poem, I wish to know whether he is alive; for I would not willingly give pain."

HOME, JOHN, an eminent dramatic poet, was born at Leith on the 22d of September (o.s.), 1722. He was the son of Mr. Alexander Home, town-clerk of Leith, whose father was the son of Mr. Home, of Flass in Berwickshire, a lineal descendant of Sir John Home of Cowdenknowes, from whom the present Earl of Home is descended. John Home, who during his whole life retained a proud recollection of his honourable ancestry, was educated, first at the grammar-school of his native town, and then at the university of Edinburgh. In both of these seminaries

he prosecuted his studies with remarkable diligence and success. While he attended the university, his talents, his progress in literature, and his peculiarly agreeable manners, soon excited the attention, and procured in no small degree the favour, both of the professors and of his fellow-students. He here formed an acquaintance which lasted through life with many of those eminent men who elevated the literary character of Scotland so highly during the eighteenth century. After qualifying himself by the ordinary course of studies to undertake the duties of a clergyman in the Scottish church, he was licensed to preach on the 4th of April, 1745.

The natural character of Home was ardent and aspiring. Under the meek garb of a Scottish licentiate he bore a heart which throbbed eagerly at the idea of military fame, and the whole cast of his mind was romantic and chivalrous. It might have been expected that, in the celebrated quarrel which divided the national mind in 1745, such a person would have been unable to resist the temptation of joining Prince Charles. It happened, however, that the chivalry of Home was of a Whiggish cast, and that his heart burned for civil freedom as well as for military glory. He therefore became a volunteer in a royal corps which was raised at Edinburgh to repel the attack of the Chevalier. This corps, when the danger approached in all its reality, melted almost into thin air; yet Home was one of a very small number who protested against the pusillanimous behaviour of the rest. Having reluctantly laid down his arms, he employed himself next day in taking observations of the strength of the Highland forces, which he appears to have communicated to Sir John Cope: while thus engaged, he was near enough to the prince to measure his stature against his own. In the early part of the succeeding year he reappeared in arms as a volunteer, and was present at the disgraceful affair of Falkirk, where he was taken prisoner. Being conveyed to Doune Castle, then under the keeping of a nephew of Rob Roy, he was confined for some days, along with several companions in misfortune; but the whole party at length escaped, by cutting their blankets into shreds and letting themselves down upon the ground. He now took up his residence at Leith, and for some time prosecuted his professional duties, mixed, however, with a kind of reading to which his inclination led, that of the historians and classics of Greece and Rome.

"His temper," says his friendly biographer Mackenzie, "was of that warm susceptible kind which is caught by the heroic and the tender, and which is more fitted to delight in the world of sentiment than to succeed in the bustle of ordinary life. His own favourite model of a character, and that on which his own was formed, was the ideal being young Norval in his own play of *Douglas*, one endowed with chivalrous valour and romantic generosity, eager for glory beyond any other object, and, in the contemplation of future fame, entirely regardless of the present objects of interest and ambition. The same glowing complexion of mind which gave birth to this creature of fancy, coloured the sentiments and descriptions of his ordinary discourse; he had a very retentive memory, and was fond of recalling the incidents of past times, and of dramatizing his stories by introducing the names and characters of the persons concerned in them. The same turn of mind threw a certain degree of elevation into his language, and heightened the narrative in which that language was employed; he spoke of himself with a frankness which a man of that disposition is apt to indulge, but with which he sometimes forgot that his audience was not always inclined to sympathize, and thence

he was accused of more vanity than in truth belonged to his character. The same warm colouring was employed in the delineation of his friends, to whom he assigned a rank which others would not always allow. So far did he carry this propensity, that, as Dr. Robertson used jokingly to say, he invested them with a sort of supernatural privilege above the ordinary humiliating circumstances of mortality. 'He never,' said the doctor, 'could allow that a friend was sick till he heard of his death.' To the same source were to be traced the warm eulogies which he was accustomed to bestow upon them. 'He delighted in bestowing as well as in receiving flattery,' said another of his intimates; 'but with him it had all the openness and warmth of truth. He flattered all of us, from whom his flattery could gain no favour, fully as much, or indeed more willingly, than he did those men of the first consequence and rank, with whom the circumstances of his future life associated him; and he received any praise from us with the same genuine feelings of friendship and attachment.' There was no false coinage in this currency which he used in his friendly intercourse; whether given or received, it had with him the stamp of perfect candour and sincerity."

Such was the enthusiastic young man who was destined for the strange glory of producing in Scotland a tragedy upon a Scottish tale. In 1746 he was presented by Sir David Kinloch of Gilmerton to the church and parish of Athelstaneford in East Lothian, then vacant by the death of the Rev. Robert Blair, the author of the *Grave*. Previous to this period his passionate fondness for Plutarch had led him to commence a tragedy upon one of his heroes—*Agis*—which he finished soon after he was settled in Athelstaneford. In 1749 he went to London, and offered his work to Garrick, for representation at Drury Lane, of which that great actor had recently become manager. But the English Roscius did not think it well adapted to the stage, and declined bringing it on, much to the mortification of the author, who, with the feeling natural to such a situation, wrote the following verses on the tomb of Shakspeare in Westminster Abbey:—

Image of Shakspeare! to this place I come,
To ease my bursting bosom at thy tomb;
For neither Greek nor Roman poet fired
My fancy first—these chiefly I admired;
And, day and night revolving still thy page,
I hoped, like thee, to shake the British stage:
But cold neglect is now my only meed,
And heavy falls it on so proud a head.
If powers above now listen to my lyre,
Charm them to grant, indulgent, my desire;
Let petrification stop this falling tear,
And fix my form for ever marble here.

After this unsuccessful journey to London, he turned his mind to the composition of the tragedy of *Douglas*, which was founded upon the beautiful old ballad of *Gil Morris*. Having finished this in the intervals of his professional labours, he set out upon another expedition to the metropolis, February, 1755, with the favourable hopes of a circle of most intelligent friends, to whom he had intrusted it for perusal. It was, however, as ill received as *Agis*: Mr. Garrick returned it with the declaration that it was totally unfit for the stage. With this opinion, which many excellent English critics still maintain, neither the poet nor his friends were at all satisfied. Those friends, looking upon it with the eyes of Scotsmen, beheld in it something quite superior to the ordinary run of English tragedies; and accordingly they recommended that it should be presented upon the Edinburgh stage, which was then conducted by a gentleman named Digges, whom Mr. Mackenzie describes as possessed of great powers (though with

many defects), and of great popularity in Scotland. The recommendation was carried into effect; and all Edinburgh was presently in a state of wild excitement from the circumstance of a play being in preparation by a minister of the Established church.¹ The actors at the Edinburgh theatre happened to be in general men of some ability in their profession, and the play was thus cast: Digges, *Young Norval*; Hayman, *Old Norval*; Love, *Glenalvon*; Mrs. Warde, *Lady Randolph*. But the name Barnet was at this time used for Randolph, and Norval was called Norman. The first representation, which took place December 14, 1756, was honoured by the

¹ It is not to be borne in authority of in theatrical matters—the Edinburgh *Douglas* (a weekly newspaper, while under the management of Mr. Edward Hislop—Dr. Carlyle, and others of his brethren, not only attended the rehearsals of *Douglas*, but themselves performed in the first of them: "It may not be generally known," says the authority just referred to, "that the first rehearsal took place in the lodgings in the Canongate occupied by Mrs. Sarah Warde, one of Digges's company; and that it was rehearsed by, and in presence of, the most distinguished literary characters Scotland ever could boast of. The following was the cast of the piece on the occasion:—

Dramatis Personæ.

Lord Randolph, . . .	Dr. Robertson, principal, Edinburgh.
Glenalvon, . . .	David Hume, historian.
Old Norval, . . .	Dr. Carlyle, minister of Musselburgh.
Douglas, . . .	John Home, the author.
Lady Randolph, . . .	Dr. Ferguson, professor.
Anna the Maid, . . .	Dr. Blair, minister, High Church.

The audience that day, besides Mr. Digges and Mrs. Warde, were the Right Honourable Patrick Lord Elibank, Lord Milton, Lord Kames, Lord Monboddo (the two last were then only lawyers, the Rev. John Steele and William Home, ministers. The company, all but Mrs. Warde, dined afterwards at the Griskin Club, in the Abbey. The above is a signal proof of the strong passion for the drama which then obtained among the *literati* of this capital, since then unfortunately much abated. The rehearsal must have been conducted with very great secrecy; for what would the kirk, which took such deep offence at the composition of the piece by one of its ministers, have said to the fact of no fewer than four of these being engaged in rehearsing it, and two others attending the exhibition? The circumstance of the gentle Anna having been personated by "Dr. Blair, minister of the High Church," is a very dull one."—*Edinburgh Weekly Chronicle*, January 27, 1759.

This statement may not be accurate—it is only a quotation from a newspaper; but assuming that it has some truth in it, we hesitate not to say that it is far from being either "droll" or creditable to the eminent persons to whom it refers: "Sir," said Dr. Johnson, upon one occasion, "this meriment of parsons is very offensive."

As to Dr. Robertson's share in these transactions, it is only fair to quote what is said by his biographer. Mr. Stewart's words are as follows: "The extraordinary merits of Mr. Home's performance, which is now become to Scotsmen a subject of national pride, were not sufficient to atone for so bold a departure from the austerity expected in a Presbyterian divine; and the offence was not a little exasperated by the conduct of some of Mr. Home's brethren, who, partly from curiosity, and partly from a friendly wish to share in the censure bestowed on the author, were led to witness the first representation of the piece on the Edinburgh stage. In the whole course of the ecclesiastical proceedings connected with these incidents, Dr. Robertson distinguished himself by the ablest and most animated exertions in defence of his friends; and contributed greatly, by his persuasive eloquence, to the mildness of that sentence in which the prosecution at last terminated. His arguments on this occasion had, it may be presumed, the greater weight, that he had never himself entered within the walls of a playhouse; a remarkable proof, among numberless others which the history of his life affords, of that scrupulous circumspection in his private conduct, which, while it added so much to his usefulness as a clergyman, was essential to his influence as the leader of a party; and which so often enabled him to recommend successfully to others the same candid and indulgent spirit that was congenial to his own mind."—*Account of the Life and Writings of Dr. Robertson*, by Dugald Stewart, Esq., p. 12.

In this passage Mr. Stewart disavows, in general terms, the belief that the principal gave the tragedy of *Douglas* any active patronage, by attending the representations or otherwise; but the statement that Dr. Robertson "had never himself entered within the walls of a playhouse," cannot be considered as an absolute contradiction of his having been present at the rehearsal "in the lodgings in the Canongate occupied by Mrs. Sarah Warde."

presence of a large audience, comprising many friends of the author, clerical as well as otherwise. It was received with enthusiastic applause, and, in the conclusion, drew forth many tears, which were perhaps a more unequivocal testimony to its merits. The town was in an uproar of exultation, that a Scotsman should write a tragedy of the first rate, and that its merits were first submitted to them.

But the most remarkable circumstance attending its representation was the clerical contest which it excited, and the proceedings of the Church of Scotland regarding it. Owing to certain circumstances—among which was reckoned the publication of Lord Kames' *Essays on Natural and Revealed Religion*, which were suspected of a tendency to infidelity, besides the issue of a work in England entitled *England's Alarm*, in which Scotland was accused of cherishing great corruptions in religion—there obtained in the church a more zealous disposition than usual to lop off heresies and chastise peccant brethren. Hence the prosecution raised against Mr. Home, which at any rate must have taken place, was characterized by an appearance of rancour which has often since been the subject of ridicule.

The presbytery of Edinburgh commenced the proceedings by publishing a solemn admonition, in which they expressed deep regret at the growing irreligion of the times, and warned all persons within their bounds, especially the young, against the danger of frequenting stage-plays. This document only provoked the mirth of the public; it was replied to by a perfect torrent of *jeux d'esprit*. The church, however, though unable to inflict any punishment upon the people at large for their admiration of the play, had the author and all his clerical abettors completely in their power. Mr. Home only escaped degradation by abdicating his pulpit, which he did in June, 1757. His friends who had been present at the representation were censured or punished according to the degree of their supposed misconduct. Mr. White, the minister of Libberton, was suspended for a month—a mitigated sentence in consideration of his apology, which was—that he had attended the representation only once, when he endeavoured to conceal himself in a corner, to avoid giving offence.

The misfortune of the Scottish church on this occasion consisted only in a little want of discrimination. They certainly did not err in characterizing the stage as immoral; for the stage, both then and since, and in almost all periods of its existence, has condescended to represent scenes, and give currency to language, which, in the general society of the period, could not be tolerated. But though the stage seems thus to claim a privilege of lagging behind the moral standard of every age, and in general calculates itself for the gratification of only a secondary order of tastes, there was surely something to be said in favour of a man who, having devoted his leisure to the cultivation of an elegant branch of the belles-lettres, had produced a work not calculated to encourage the immoral system complained of, but to correct it by introducing a purer taste, or which could at least not be played without for that night preventing the representation of something more fatal to good manners. There were many, no doubt, who were rather rejoiced than saddened at finding a stream of purer feeling disposed to turn itself into the Augean stable of the theatre, because they calculated that since men cannot be withheld from that place of amusement, the next best course is to make the entertainment as innocent as possible.

Mr. Home had been introduced some years before by Sir David Kinloch, the patron of his parish, to Lord Justice-clerk Milton, who then acted as *sous*

ministre for Scotland, under Archibald Duke of Argyle. Being introduced by Lord Milton to the duke, his grace said that, being now too old to be of any material service in improving his prospects, he would commit him to his nephew the Earl of Bute, who was succeeding to that nameless situation of trust and patronage which had been so long held by himself. Accordingly, on Mr. Home's going to London in 1757, he was kindly received by Lord Bute, who, having that influence with Garrick which had been found wanting in the merit of the play itself, soon caused it to be brought out at Drury Lane. Notwithstanding Garrick's unchanged opinion of its merit, it met with distinguished success.

Lord Bute, besides procuring Mr. Home this highest gratification which he was capable of receiving, provided for his personal wants by obtaining for him the sinecure situation of conservator of Scots privileges at Campvere. Thus secure as to the means of subsistence, the poet reposed with tranquillity upon his prospects of dramatic fame. His tragedy of *Agis*, which had been written before *Douglas*, but rejected, was brought forward, and met with success, Garrick and Mrs. Cibber playing the principal characters. The *Siege of Aquileia* was represented in 1750, but, owing to a want of interest in the action, did not secure the favour of the audience. In 1760 he printed his three tragedies in one volume, and dedicated them to the Prince of Wales, whose society he had enjoyed through the favour of the Earl of Bute, preceptor to the prince. When this royal personage became king, he signified his favour for Mr. Home by granting him a pension of £300 a year from his privy-purse—which, in addition to an equal sum from his office of conservator, rendered him what in Scotland might be considered affluent. About this period he spent the greater part of his time in London, but occasionally came to Scotland to attend his duties as an elder in the General Assembly, being appointed to that trust by the ecclesiastical establishment at Campvere, which then enjoyed a representation in the great clerical council of the nation. In 1767 he forsook almost entirely the company of the Earl of Bute and his other distinguished friends at London, and planted himself down in a villa which he built near his former residence in East Lothian, and where he continued to reside for the next twelve years. To increase the felicity of a settled home, he married a lady of his own name in 1770, by whom he never had any children.

Three tragedies, the *Fatal Discovery*, *Alonzo*, and *Alfred*, successively appeared in 1769, 1773, and 1778; but, though received at first with considerable applause, they took no permanent hold of the stage, and thus seemed to confirm the opinion which many English critics had avowed in regard to the success of *Douglas*—that it was owing to no peculiar powers of dramatic composition in the author, but simply to the national character of the piece, with a slight aid from its exhibition of two very popular passions, maternal and filial tenderness.¹ The reception of

the last-mentioned play was so cool, that he ceased from that time to write for the stage.

Mr. Home, as already mentioned, lived in terms of the greatest intimacy with all the literary men of his time: he seems, however, to have cherished no friendship with so much ardour as that which he entertained for his philosophical namesake, David Hume. During the course of a lengthened period of friendly intercourse with this individual, only two trifling differences had ever risen between them. One referred to the orthography of their name, which the dramatic poet spelled after the old and constant fashion of his family, while the philosopher had early in life assumed the spelling indicated by the pronunciation. David Hume at one time jocularly proposed that they should determine this controversy by casting lots, but the poet answered, "Nay, that is a most extraordinary proposal indeed, Mr. Philosopher, for, if you lose, you take your own name, whereas, if I lose, I take another man's name."

The other controversy referred merely to their taste in wine. Mr. John Home had the old Scottish prepossession in favour of claret, and utterly detested port. When the former drink was expelled from the market by high duties, he wrote the following epigram, as it has been called, though we confess we are at a loss to observe anything in it but a narrative of supposed facts:

lines in the whole play. He now persisted in this. I endeavoured to defend that pathetic and beautiful tragedy, and repeated the following passage:

Sincerity,
Thou first of virtues, let no mortal leave
Thy onward path, altho' the earth should gaze,
And from the gulf of hell destruction cry,
To take dissimulation's winding way.

Johnson. 'That will not do, sir. Nothing is good but what is consistent with truth or probability, which this is not. Juvenal indeed gives us a noble picture of inflexible virtue:

Esto bonus miles, tutor bonus, arbiter idem
Integer: ambigue si quando citabere testis
Incertaque rei, Phalaris licet imperet, ut sis
Falsus, et admodum dicet perjuria tauro,
Summum crede nefas, animam præferre pudori,
Et, propter vitam, vitæ perdere causas.'

He repeated the lines with great force and dignity; then added, 'And after this comes Johnny Home, with his *earth gaping* and his *destruction crying*!—Pooh!'—Boswell's *Journal of a Tour to the Hebrides*.

It must be acknowledged Boswell was not fortunate in the specimen he produced, and that the passage quoted by Johnson from Juvenal is infinitely superior. The circumstances attending the representation of *Douglas* were not such as to dispose an English critic to allow its merit. In the first place, the national taste was in some degree committed in the judgment passed upon the play by the favourite actor and manager; and it was not only galling to himself, but to all who relied upon his taste, that he should have been mistaken. In the next place, the Scotch did not use their triumph with discretion; they talked of the merits of *Douglas* in a strain quite preposterous, and of which no unfair specimen is to be found in the anecdote of a Caledonian who, being present in the pit of Drury Lane one night of its performance, is said to have exclaimed, in the insolence of his exultation, "Whar's your Wully Shakspeare now?" Such ridiculous pretensions are now forgotten, but they were advanced at the time, and, from their extreme arrogance and absurdity, could not fail to exasperate a mind so ready to repel insult as Johnson's, and so keenly alive as his was to the honour of the national literature of England. The natural consequence followed: he decried *Douglas* perhaps as much as it was overvalued by its admirers; and his acquaintance with far superior compositions must have enabled him, as in the instance above quoted, to pour derision upon it with an effect which the more judicious part of its admirers could not contend with, the more especially as the noise of indiscriminating applause with which it was hailed, had induced them to assume higher ground than their sober judgment would have led them to fix upon. And indeed, it may be a question whether the same cause that contributed to the first popularity of *Douglas* does not still continue to operate, preserving to our only tragedy a higher rank than it really is entitled to occupy: it is rare that the parents of an only child do not love and admire him for virtues which all the world else fails to discover that he is possessed of,

¹ "As we sat over our tea," says Boswell on this subject, "Mr. Home's tragedy of *Douglas* was mentioned. I put Dr. Johnson in mind that once, in a coffee-house at Oxford, he called to old Mr. Sheridan, 'How came you, sir, to give Home a gold medal* for writing that foolish play?' and deified Mr. Sheridan to show ten good lines in it. He did not insist that they should be together; but that there were not ten good

* "The elder Sheridan, then manager of the theatre at Dublin, sent Mr. Home a gold medal in testimony of his admiration of *Douglas*; and his wife, a woman not less respectable for her virtues than for genius and accomplishments, drew the idea of her admired novel of *Sydney Biddulph*, as her introduction bears, from the genuine moral effect of that excellent tragedy."—Mackenzie's *Life of Home*, p. 47.

"Firm and erect the Caledonian stood,
 Old was his mutton, and his claret good;
 'Let him drink port,' an English statesman cried—
 He drank the poison, and his spirit died."

David Hume, who to his latest breath continued the same playful personage he had ever been, made the following allusion to the two controversies in a codicil to his will, dated only eighteen days before his death:—"I leave to my friend Mr. John Home of Kilduff, ten dozen of my old claret at his choice, and one other bottle of that other liquor called port. I also leave him six dozen of port, provided that he attests, under his hand, signed John Hume, that he has himself alone finished that bottle at two sittings. By this concession he will at once terminate the only two differences that ever arose between us concerning temporal matters."

When this eccentric philosopher was recommended for his health to pay a visit to Bath, his faithful friend Home accompanied him, and was of great service, by his lively conversation and kind attentions, in supporting him against the attacks of a virulent disease. The journey took place in April, 1776, and Mr. Mackenzie has preserved a curious diary by Mr. Home, detailing the principal matters which passed between him and his fellow-traveller in conversation. Many of the anecdotes told by the philosopher are exceedingly valuable as snatches of what is styled secret history.

Mr. Home spent the latter moiety of his long life in a state little removed from indolence. He removed to Edinburgh in 1779, and thenceforward lived in the enjoyment of that high literary society which the character of his mind fitted him to enjoy, and in which his income fortunately permitted him to indulge. Careless of money in the highest degree, he delighted in entertaining large companies of friends, and often had his house filled to a degree which would now be considered intolerable with permanent guests.

The only production of his later years was a *History of the Rebellion of 1745*—a transaction of which he was entitled to say, *pars fui*. He had projected something of the kind soon after the event, but did not proceed with it till after he had given up dramatic writing. If there was any literary man of the day from whom, rather than from any other, a good work upon this subject might have been confidently expected, it was Mr. Home, who had not only taken a strong personal interest in the affair, but possessed that generous and chivalrous colour of mind which was most apt to do it justice in narration. Unfortunately, before setting about this work, he had met with an accident by a fall from his horse, in consequence of which his intellect was permanently affected. As a pensioner of King George III. he was also prevented from giving that full expression to his sentiments which was so necessary in the historian of such an event. This work, therefore, when it appeared in 1802, was found to be a miserable sketchy outline of the transaction, rather than a complete narrative—here and there, indeed, as copious as was to be wished, and also showing occasional glimpses of the poetical genius of the author, but in general "stale, flat, and unprofitable." The imperfections of the work have been partly accounted for, without contradiction, by the circumstance of its having been submitted to the inspection of the reigning family, with the understanding that they were at liberty to erase such passages as they did not wish to be made public.

Mr. Home died on the 5th of September, 1808, when he was just on the point of completing his eighty-sixth year. As a man, he was gentle and

amiable, a very warm friend, and incapable of an ungenerous feeling. As a poet, he deserves the credit of having written with more fervid feeling, and less of stiffness and artificiality, than the other poets of his time; his genius in this respect approaching to that of his friend Collins. The present age, however, has, by its growing indifference to even his sole successful play, pronounced that his reputation on account of that exertion was in a great measure the result of temporary and local circumstances, and that, being ill based, it cannot last.

HOPE, SIR JOHN, latterly Earl of Hopetoun, a celebrated military commander, was son to John, second Earl of Hopetoun, by his second marriage with Jane, daughter of Robert Oliphant of Rossie, in the county of Perth. He was born at Hopetoun, in the county of Linlithgow, on the 17th of August, 1766. After finishing his education at home, he travelled on the Continent, where he had the advantage of the superintendence of Dr. Gillies, author of the *History of Greece*, afterwards historiographer to the king. Mr. Hope entered the army as a volunteer in the fifteenth year of his age, and on the 28th of May, 1784, received a cornetcy in the 10th regiment of light dragoons. We shall briefly note his gradual rise as an officer until he reached that rank in which opportunities were afforded of distinguishing himself. On the 24th of December, 1785, he was appointed to a lieutenancy in the 100th foot; on the 31st October, 1789, to a company in the 17th dragoons; on the 25th of April, 1792, to a majority in the 2d foot; and on the 26th of April, 1793, to a lieutenant-colonelcy in the 25th foot. It was the period when the claims of rank began to meet with less observance in the British army, and severer duties called for the assistance of active and persevering men; and these had before them a sure road to honour. So early as 1794 Lieutenant-colonel Hope was appointed to the arduous situation of adjutant-general to Sir Ralph Abercromby when serving in the Leeward Islands; during the three ensuing years he was actively employed in the campaigns in the West Indies, where he held the rank of brigadier-general; during this service he is characterized in the despatches of the commander-in-chief as one who "on all occasions most willingly came forward and exerted himself in times of danger, to which he was not called from his situation as adjutant-general."

In the parliament of 1796 Mr. Hope was returned as member for Linlithgowshire: as a legislator he has been very little known, and he soon relinquished a duty not probably accordant with his taste and talents. As a deputy adjutant-general he attended the expedition to Holland in August, 1799, having, in the interval betwixt his services abroad, performed the duty of a colonelcy in the North Lowland fencibles. In the sharp fighting at the landing at the Helder, with which the proceedings of the secret expedition to Holland commenced, Colonel Hope had the misfortune to be so severely wounded as to render his farther attendance on the expedition impracticable. From the effects of his wound he recovered during the ensuing October, when he was appointed adjutant-general to the Duke of York, Lieutenant-colonel Alexander Hope, his brother by his father's third marriage, being appointed his successor as deputy adjutant-general. In 1800 Colonel Hope joined the expedition to Egypt under Sir Ralph Abercromby, who had been his commanding officer at the attack on the Helder. He still acted as adjutant-general, and on the 13th of May he was appointed brigadier-general in the Mediterranean. Were we to follow this active officer's footsteps

through the progress of the Egyptian war, we should merely repeat what the best pens in Europe have been engaged in discussing for thirty years, and what generally is known; suffice it to say, that he was engaged in the actions of 8th and 13th March, 1801, and that he received a wound on the hand at the battle of Alexandria. In June he was able to proceed with the army to Cairo, where he has received credit as an able negotiator, for the manner in which he settled the convention for the surrender of that place with the French commander, General Belliard. On the 11th of May, 1802, he was promoted to the rank of a major-general. On the 30th of June, 1805, he was appointed deputy-governor of Portsmouth—an office he resigned the same year, on being nominated to a command with the troops sent to the Continent under Lord Cathcart. On the 3d of October, 1805, he was made colonel of the 2d battalion of the 60th foot, and on the 3d of January, 1806, colonel of the 92d foot. On the 25th of April, 1808, he was made a lieutenant-general.¹

Lieutenant-general Hope was among the most eminent and persevering partakers in that exterminating war in the Peninsula, where, as in the conflicts of ancient nations, everything gained was the price of blood. On the 8th of August he landed with the British forces in Portugal; during the ensuing month he was appointed British commandant at Lisbon; and on the French gradually evacuating the town, in terms of their convention, he took possession of the castle of Belem on the 10th, and of the citadel on the 12th. The restless spirit of the Portuguese, on the knowledge that the French were to leave the country, caused their long-smothered indignation to appear in insults, threats, and even attempts on the lives of the general officers; to depart in safety was the object of the French, and General Hope had the difficult task of preventing the oppressed people from making dangerous displays of public feeling—a duty he performed with moderation and energy, and which he was enabled finally to complete.

Sir John Moore divided his forces into two columns, one of which, under his own command, marched by Almeida and Ciudad Rodrigo, while the other proceeded to the Tagus under the command of General Hope. While thus separated from his celebrated commander, both experienced the full danger and doubt which so amply characterized the disastrous campaign. The few Spanish troops who had struck a blow for their country, fleeing towards the Tagus, brought to General Hope the traces of the approach of the victorious French. His column, consisting of three thousand infantry and nine hundred cavalry, were in want and difficulty. The inhospitable country afforded insufficient supplies of provision; they were destitute of money, and of many necessary articles of military store. To enable his troops in some measure to obtain supplies he separated his whole column into six divisions, each a day's march distant from the others, and thus passing through an uncultivated country destitute of roads, whose few inhabitants could give no assistance and could not be trusted, and harassed by the neighbourhood of a powerful enemy, he had to drag his artillery and a large park of ammunition to join the commander-in-chief, whose safety depended on his speedy approach. At Almaraz he endeavoured to discover

some path which might guide him through the hills to Ciudad Rodrigo, but not finding one easily accessible, the jaded state of his few remaining horses compelled him to relinquish the attempt to cross these regions. On reaching Talavera, to the other evils with which he had to contend was added the folly or perfidy of the Spanish functionaries: the secretary at war recommended to him a method of passing through Madrid, which on consideration he found would have been the most likely of all methods to throw him into the hands of the French army. Resolving to make a last effort to obtain assistance from the nation for which the British troops were wasting their blood, he proceeded in person to Madrid; but the uncontrolled confusion of the Spanish government threw additional discouragements on his prospects, and he found that the safety of his men must depend on their own efforts. Avoiding the path so heedlessly proposed, he passed Naval Carnero, and reached Escorial, where he halted to bring up his rear, and to obtain bullocks for dragging his artillery and ammunition. Having crossed the mountains on the sixth day after leaving Madrid, his situation became more melancholy, and he fell into deeper difficulties. He received the intelligence of additional disasters among the Spaniards; and his scouts traced the vicinity of parties of the enemy. "The general's situation," says Colonel Napier in his *History of the Peninsular War*, "was now truly embarrassing. If he fell back to the Guadarama, the army at Salamanca would be without ammunition or artillery. If he advanced, it must be by a flank march of three days, with a heavy convoy, over a flat country, and within a few hours' march of a very superior cavalry. If he delayed where he was, even for a few hours, the French on the side of Segovia might get between him and the pass of Guadarama, and then, attacked in front, flank, and rear, he would be reduced to the shameful necessity of abandoning his convoy and guns to save his men in the mountains of Avila. A man of less intrepidity and calmness would have been ruined; but Hope, as enterprising as he was prudent, without any hesitation ordered the cavalry to throw out parties cautiously towards the French, and to maintain a confident front if the latter approached; then moving the infantry and guns from Villacastin, and the convoy from Espinosa, by cross-roads to Avila, he continued his march day and night until they reached Peneranda: the cavalry covering this movement, closed gradually to the left, and finally occupied Fontiveros on the 2d of December."² Not without additional dangers from the vicinity of the enemy, to the number of 10,000 infantry and 2000 cavalry, with 40 guns, he at length reached Salamanca, and joined the commander-in-chief. He partook in the measures which the army, thus recruited, endeavoured to pursue, as a last effort of active hostility, passing with his division the Douro at Tordesillas, and directing his march upon Villepando. In the memorable retreat which followed these proceedings he had a laborious and perilous duty to perform. He commanded the left wing at the battle of Corunna; of his share in an event so frequently and minutely recorded it is scarcely necessary to give a detailed account. After the death of the commander-in-chief, and the wound which compelled Sir David Baird to retire from the field, General Hope was left with the honour and responsibility of the supreme command, and, in the language of the despatches, to his "abilities and exertions in the direction of the ardent zeal and unconquerable valour of his majesty's troops, is to be

¹ These dry details of military advancement, which we would willingly spare our readers were they not necessary for the completeness of a biography, we have copied from the *Annual Biography and Obituary* for 1824, a source from which we derive all the dates in this memoir, judging it one likely to be depended on.

² Vol. i. p. 427.

attributed, under Providence, the success of the day, which terminated in the complete and entire repulse and defeat of the enemy."

It was the immediate decision of Sir John Hope not to follow up a victory over so powerful an enemy, but taking advantage of the confusion of the French, to proceed with the original design of embarking the troops, a measure performed with true military alacrity and good order, not without the strenuous exertions of the general, who, after the fatigues of the day, personally searched till a late hour the purlieus of the town, to prevent stragglers from falling into the hands of the enemy. General Hope wrote to Sir David Baird a succinct and clear account of the battle, in which his own name seldom occurs. As exhibiting the subdued opinion he expressed of the advantage gained, and as what is very probably a specimen of his style of composition, we quote the following passage from this excellent document:—"Circumstances forbid us to indulge the hope that the victory with which it has pleased Providence to crown the efforts of the army can be attended with any very brilliant consequences to Great Britain. It is clouded by the loss of one of her best soldiers. It has been achieved at the termination of a long and harassing service. The superior numbers and advantageous position of the enemy, not less than the actual situation of this army, did not admit of any advantage being reaped from success. It must be, however, to you, to the army, and to our country, the sweetest reflection, that the lustre of the British arms has been maintained, amidst many disadvantageous circumstances. The army, which had entered Spain amidst the fairest prospects, had no sooner completed its junction, than, owing to the multiplied disasters that dispersed the native armies around us, it was left to its own resources. The advance of the British corps from Douro afforded the best hope that the south of Spain might be relieved, but this generous effort to save the unfortunate people also afforded the enemy the opportunity of directing every effort of his numerous troops, and concentrating all his principal resources, for the destruction of the only regular force in the north of Spain."

The grateful acknowledgements of his country crowded thickly on General Hope after the arrival of the despatches in England; a vote of thanks to him and to the officers under his command was unanimously passed in the House of Lords, on the motion of the Earl of Liverpool; in the House of Commons, on that of Lord Castlereagh. As a reward for *his* services, his *brother* (the Earl of Hopetoun) was created a baron of the United Kingdom by the title of Baron Hopetoun of Hopetoun in the county of Linlithgow, and himself received the order of the Bath, in which he was installed two years afterwards, along with twenty-two other knights. Soon after his return to Britain Sir John was appointed to superintend the military department of the unsatisfactory expedition to the Scheldt. It was the intention of the planners of the expedition, that by landing on the north side of South Beveland, and taking possession of the island, Sir John might incommode the French fleet while it remained near Flushing, and render its retreat more difficult, while it might be subject to the attacks of the British ships. Sir John's division landed near Ter-Goes, took possession of the important post of Baltz, and removed all impediments to the progress of the British vessels in the West Scheldt. For nine days Sir John occupied his post, waiting impatiently for the concerted arrival of the gun-boats under the command of Sir Home Popham, harassed by frequent attacks from the enemy, in one of which they brought down about twenty-eight gun-

vessels, and kept up a cannonade for several hours, but were, after much exertion on the part of the general, compelled to retreat. The termination and effect of the expedition are well known, and need not be here repeated. At the termination of the expedition Sir John Hope was appointed commander-in-chief of the forces in Ireland, but he soon left this unpleasant sphere of duty, to return in 1813 to the scene of his former exertions in the Peninsula. At the battle of Nivelles he commanded the left wing, and driving in the enemy's outposts in front of their entrenchments on the Lower Nivelles, carried the redoubt above Orogue, and established himself on the heights immediately opposite Sibour, in readiness to take advantage of any movement made by the enemy's right. On the 10th of December nearly the whole army of the enemy left their entrenchments, and having drawn in the piquets, advanced upon Sir John Hope's posts on the highroad from Bayonne to St. Jean de Luz. At the first onset Sir John took 500 prisoners, and repulsed the enemy, while he received in the course of the action a severe contusion on the head. The same movement was repeated by the enemy, and they were in a similar manner repulsed. The conduct of Sir John on this occasion has received the approbation of military men, as being cool, judicious, and soldierly; and he received the praises of the Duke of Wellington in his despatches.

In this campaign, which began on the frontiers of Portugal, the enemy's line of defence on the Douro had been turned, and after defeat at Vittoria, Soult had been repulsed in his efforts to relieve St. Sebastian and Pamplona, and the army of France had retreated behind the Pyrenees. On the fall of the latter place the army entered France, after many harassing operations, in which the progress of the allies was stoutly impeded by the indomitable Soult. In the middle of February, 1814, the passage of the Adour was accomplished. While the main body of the army under the Duke of Wellington prosecuted the campaign in other quarters, Sir John Hope was left with a division to invest the citadel and town of Bayonne on both banks of the river. Soon after these operations commenced, Sir John received information from two deserters that the garrison was under arms, and prepared for a sortie before daylight next morning. By means of a feint attack at the moment they were so expected, and by the silent and stealthy movements of some of their men through the rough ground, many of the sentinels were killed, and several lines of piquets broken. The nature of the spot, with a hollow way, steep banks, and intercepting walls, deprived those so attacked of the power of retreating, and the whole vicinity was a series of scattered battles, fought hand to hand, with deadly bitterness. The chief defence of the besiegers lay in the fortified convent of St. Bernard, and in some buildings in the village of St. Etienne; to the latter post Sir John Hope proceeded with his staff at the commencement of the attack. Through one of the inequalities of the ground already mentioned, which formed a sort of hollow way, Sir John expected to find the nearest path to the village. When almost too late, he discovered that the banks had concealed from him the situation of the enemy, whose line he was just approaching, and gave orders to retreat; before, however, being extricated from the hollow way, the enemy approached within twelve yards' distance, and began firing: Sir John Hope's horse received three balls, and falling, entangled its rider. While the staff attempted to extricate him, the close firing of the enemy continued, and several British officers were wounded, among whom was

Sir John himself, and the French soldiers pouring in, made them all prisoners. The French with difficulty extricated him from the fallen horse, and while they were conveying him to the citadel, he was severely wounded in the foot by a ball supposed to have come from the British piquets. From the effects of this encounter he suffered for a considerable period.

On the 3d of May Sir John was created a British peer by the title of Baron Niddry of Niddry, county of Linlithgow. He declined being a partaker in the pecuniary grant which, on the 9th of June ensuing, was moved by the chancellor of the exchequer, as a reward for the services of him and other distinguished generals. On the death of his brother by his father's prior marriage, he succeeded to the family title of Earl of Hopetoun, and in August, 1819, he attained to the rank of general. He died at Paris, on the 27th August, 1823, in the fifty-eighth year of his age. From the *Edinburgh Annual Register* for 1823 we extract a character of this excellent and able man, which, if it have a small degree too much of the beau ideal in its composition, seems to be better fitted to the person to whom it is applied than it might be to many equally celebrated.

"As the friend and companion of Moore," says this chronicle, "and as acting under Wellington in the Pyrenean campaign, he had rendered himself conspicuous. But it was when, by succession to the earldom, he became the head of one of the most ancient houses in Scotland, and the possessor of one of its most extensive properties, that his character shone in its fullest lustre. He exhibited then a model, as perfect seemingly as human nature could admit, of the manner in which this eminent and useful station ought to be filled. An open and magnificent hospitality, suited to his place and rank, without extravagance or idle parade, a full and public tribute to the obligations of religion and private morality, without ostentation or austerity; a warm interest in the improvement and welfare of those extensive districts with which his possessions brought him into contact—a kind and generous concern in the welfare of the humblest of his dependants—these qualities made him beloved and respected in an extraordinary degree, and will cause him to be long remembered."¹

HOPE, SIR THOMAS, an eminent lawyer and statesman of the seventeenth century, and the founder of a family distinguished for its public services, was the son of Henry Hope, a considerable Scottish merchant, whose grandfather, John de Hope, was one of the gentlemen attending Magdalene de Valois, first consort of James V., at her coming into this country in 1537.

Henry Hope, a younger brother of the subject of this memoir, following the profession of his father, was the progenitor of the great and opulent branch of the Hopes of Amsterdam; a house, for extent of commerce and solidity of credit, long considered superior, without exception, to any private mercantile company in the world.

Thomas Hope, after having distinguished himself at school in no small degree, entered upon the study

of the law, and made so rapid a progress in juridical knowledge, that he was at a very early age called to the bar. However, like the generality of young lawyers, he enjoyed at first a very limited practice; in 1606 he burst at once upon the world on the following occasion.

Six ministers of the Church of Scotland, having thought proper to deny that the king and his council possessed any authority in ecclesiastical affairs, were on that account imprisoned for some months in Blackness Castle, indicted for high-treason, and on the 10th of January, 1606, put upon trial at Linlithgow, before a jury consisting chiefly of landed gentlemen of the three Lothians. As it was carefully promulgated that the king and court had openly expressed the highest displeasure against the ministers, and had declared that they would show no favour to any person that should appear in their behalf, none of the great lawyers chose to undertake their cause; even Sir Thomas Craig, although he was procurator for the church, refused to be concerned in this affair, and Sir William Oliphant, who had at first promised to plead for them, sent word the day before that he must decline appearing. The ministers, thus abandoned, applied to Mr. Hope, who, pitying their case, with the greatest cheerfulness and resolution undertook their defence; and, notwithstanding the reiterated endeavours of the court to perplex and browbeat him, conducted himself in so skilful and masterly a manner, that he made a deep impression on the jury. However, by an unlawful tampering with the jurors (some of the lords of council having procured admittance to them after they were locked up), and assurance that no harm was intended against the persons or goods of the accused, nine of the fifteen jurymen were induced to bring in a verdict of guilty, and the ministers were sentenced to banishment forth of the kingdom, which was accordingly executed.

By the commendable intrepidity, knowledge of the law, and singular abilities manifested by Mr. Hope at this important trial, he became so greatly the favourite of the Presbyterians, that they never afterwards undertook any important business without consulting him; and he was retained in almost every cause brought by that party into the courts of justice, so that he instantly came into the first practice of any lawyer at that period. By this, in a few years he acquired one of the most considerable fortunes ever made at the Scottish bar; which enabled him to purchase, between 1613 and 1642, the lands of Grantoun, Edmonstoun, and Cauldcolts in Mid Lothian; Prestongrange in East Lothian; Kerse in Stirlingshire; Mertoun in the Merse; Kinninmonth, Arnydie, Craighall, Ceres, Hiltarvet, and others, in Fife.

It was the policy of King Charles I. to bestow honours and emoluments upon those who had most power to obstruct his designs, and hence, in 1626, the great Presbyterian barrister was made king's advocate, with permission, revived in his favour, to sit in the bar, and be privy to the hearing and determining of all causes, except those in which he was retained by any of the parties. He was also in 1628 created a baronet of Nova Scotia. If the king expected by these means to gain him over from the Presbyterians, he was grievously disappointed, for although Sir Thomas discharged the duties of his high office with attention and propriety, his gratitude, principles, and inclination were all too powerfully engaged to his first friends and benefactors to admit of his deserting them: it was, on the contrary, with pleasure that he beheld that party increasing every day in numbers and consequence. It would draw out this account to too great a length to enumerate

¹ The esteem and affection in which the earl was held in the scenes of private life, and in his character as a landlord, has since his death been testified in a remarkable manner, by the erection of no fewer than three monuments to his memory, on the tops of as many hills—one in Fife on the mount of Sir David Lindsay, another in Linlithgowshire near Hopetoun House, and the third in the neighbourhood of Haddington. An equestrian statue of his lordship has also been erected in St. Andrew's Square, Edinburgh, with an inscription from the pen of Sir Walter Scott.

all the various steps taken by them in pursuance of his office; it is enough to say that he acted as their confidant throughout the whole affair of the resistance to the liturgy in 1637, and that he was intimately concerned in framing the bond of resistance entitled the National Covenant, which was subscribed by nearly the whole population of Scotland in the succeeding year. The king, with fatal weakness, nevertheless retained him in an office which, of all others in the state, implied and required a hearty service of the royal cause. In 1643, when a parliament was required to meet in order to settle the solemn league and covenant with the English parliament, Sir Thomas, to get over the dilemma of illegality which must have characterized such a meeting, as it could not legally take place till the next year, recommended a convention of estates upon the precedent of some such transaction in the reign of James V.; and thus was achieved a measure which, more than any other, perhaps, was fatal to the royal cause: the army voted in this irregular meeting being of great avail in the decisive battle of Longmarstonmoor, which was fought soon after.

Charles, nevertheless, still persisting in his unfortunate policy, appointed Sir Thomas Hope to be his commissioner to the General Assembly, which met in August, 1643; an honour never before or since bestowed upon a commoner. The royalists were so much incensed at the appointment of an enemy instead of a friend, that they very generally absented themselves from the assembly, and the field was therefore left in a great measure clear to the Covenanters, who carried all before them. As the sanction of this body was necessary to the transaction above alluded to, the credit of the whole, direct or indirect, lies with Sir Thomas Hope.

In 1645 Sir Thomas Hope was appointed one of the commissioners for managing the exchequer, but did not long enjoy that office, dying the next year, 1646. He had the singular happiness of seeing, before his death, two of his sons seated on the bench while he was lord-advocate; and it being judged by the Court of Session unbecoming that a father should plead uncovered before his children, the privilege of wearing his hat while pleading was granted to him. This privilege his successors in the office of king's advocate have ever since enjoyed, though it is now in danger of being lost through desuetude.

The professional excellencies of Sir Thomas Hope are thus discriminated by Sir George Mackenzie, in his *Characteres Advocatorum*:—"Hopius mira inventionē pollebat, totque illi fundebat argumenta ut amplificatione tempus deesset; non ornat, sed arguebat, modo uniformi, sed sibi proprio. Nam cum argumentum vel exceptionem protulisset, rationem addebatur; et ubi dubia videbatur, rationis rationem. Ita rhetorica non illi defuit, sed inutilis apparuit."

The following are the written or published works of Sir Thomas Hope:—1, *Carmen Seculare in Serenationem Caroli I. Britanniarum Monarcham*, Edin. 1626.—2, *Psalmi Davidis et Canticum Solomonis Latino Carmine Redditum*, MS.—3, *Major Practicks*.—4, *Minor Practicks* (a very well-known work).—5, *Paratitillo in Universo Juris Corpore*.—And 6, *A Genealogie of the Earls of Mar*, MS.

In Wood's *Ancient and Modern Account of the Parish of Cramond*, from which the above facts are chiefly taken, is given a very perfect account of the numerous descendants of Sir Thomas Hope, including the noble race of Hopetoun, and many other races distinguished in the two past centuries by official eminence and public service.

HOPETOUN, EARL OF. See HOPE (SIR JOHN).

HORNER, FRANCIS, whose virtues, talents, and eloquence raised him to an eminent rank in public life while yet a young man, was born at Edinburgh on the 12th of August, 1778. His father, who was at that time a linen manufacturer and mercer upon an extensive scale, took delight in cultivating the excellent talents which his son early displayed, and doubtless contributed much to the formation of those intellectual habits, and sound and liberal principles, which marked the boy as well as the full-grown man. Francis was sent to the high-school, where he soon became a favourite with Dr. Adam, who then presided over that eminent seminary as rector, and who was accustomed to say of his distinguished pupil, that "Francis Horner was the only boy he ever knew who had an old head upon young shoulders." Nor was this remark dictated by undue partiality, although some of the most eminent men of the day were among young Horner's class-fellows: for he was never known to join in the field-sports or recreations of any of the boys, and he kept the rank of dux at school by his own industry and talents alone, having no private tutor to direct his studies. Francis indeed needed no adventitious aid; but it has been thought by some of his medical friends that these early propensities to retirement and constant study contributed to sow the seeds of that pulmonary disease which assailed his youth, and finally laid him in an untimely grave.

When removed to the university he enjoyed the instructions of several eminent professors, and in particular attracted the notice of Dugald Stewart; but the theatre, perhaps, which tended more than any other to unfold his talents and views was the Speculative Society, an institution for improvement in public speaking, and in science in general, without peculiar reference to any of the learned professions, the members of which met weekly during the sitting of the college. There are few associations of this kind which have numbered so many young men of splendid talents on their roll of members. Lord Henry Petty, the second son of the first Marquis of Lansdowne, and Messrs. Brougham and Jeffrey, were amongst Mr. Horner's associates in the arena of debate, and contributed by their mutual influence on each other's minds to invigorate and sharpen those intellectual powers which were afterwards to raise them to stations of the highest eminence and widest influence in society. Mr. Horner first directed his attention to the Scottish bar, but, like his two last-mentioned friends, with very limited success. The attainment of sufficient practice before the Scottish court can only be the result of undiminished perseverance and great industry; real talent will ultimately reach its object there, but the necessary probation is apt to dishearten conscious merit. There was something also in the political character of the times inauspicious to young men of independent principles, who sought to make their way without friends or interest by dint of talent alone; the aristocracy possessed overwhelming influence, and a considerable amount of prejudice existed in the midst of the commonalty against the first manifestations of that more liberal spirit which now began to show itself in various quarters, and more especially characterized the debates of the Speculative Society. The intervention of a jury was also unknown in civil causes, and thus the principal field for forensic eloquence was denied to the youthful aspirant. These considerations appear to have so far weighed with Mr. Horner as to induce him, though already admitted a member of faculty, to direct his attention to the English bar; and with this view he left his associates, now busily engaged with the early numbers of the *Edinburgh*

Review, and repaired to London, where he commenced the study of English jurisprudence.

In the meantime his friend Lord H. Petty, after having taken his degree at Cambridge, and visited the Continent, returned to England, and was immediately elected one of the two representatives of Calne. In the new parliament just then convoked, this young nobleman soon began to be considered a very able and formidable ally of the opposition; and upon the final success of Mr. Fox's party, Lord Henry Petty found himself, at the very early age of twenty-one, chancellor of the exchequer, a member of the privy-council, and M.P. for the university of Cambridge. In this commanding situation he strongly recommended his young Scottish friend to the notice of his coadjutor, as a gentleman whose principles, character, and talents eminently fitted him for supporting the new ministry. Mr. Horner was accordingly brought into parliament for the borough of St. Ives in 1806. By the dismissal of the Foxo-Grenville administration, Mr. Horner was for a time deprived of his parliamentary seat; but the talents and integrity which he had exhibited while in office pointed him out to the friends of liberal principles as an ally too important to be consigned to oblivion. Accordingly, on the retirement of Viscount Mahon from the representation of Wendover, Mr. Horner was immediately nominated for that place, and soon afterwards was appointed one of the commissioners for investigating the claims on the Nabob of Arcot, whose debts had been guaranteed by the East India Company—an office of considerable emolument but proportionate labour. This situation, however, he afterwards resigned, though receiving little or no emolument from professional business, which indeed he did not aim at acquiring. Once established, however, in parliament, Mr. Horner continued gradually to acquire the confidence of the house, and that hold upon public opinion without which no member of the British senate can be an efficient statesman. His speeches were little remarkable for ornament, or in a high degree for what is generally called eloquence; but he brought to the examination of every subject the power of a clear and matured understanding; and as he made it a point never to address the house upon any subject of which he had not made himself fully master, he never failed to command attention and respect. The excellence of the speaker consisted in accurate reasoning, logical arrangement of the facts, and clear and forcible illustration.

On the 1st of February, 1810, Mr. Horner entered upon that part of his parliamentary career in which he reaped his most brilliant reputation. The extraordinary depreciation of the paper-currency, and the unfavourable state of the exchanges for the last two years, had attracted the attention of the best economists of the day, and engaged Messrs. Mueset, Ricardo, and Huskisson, and many others, in the investigation of the general principles of circulation, and of the various results which are occasioned in different countries by the variations in their respective currencies. This was a subject upon which Mr. Horner felt himself at full liberty to enter. He had early turned his attention to economical subjects, and had given the result of his inquiries to the public in various articles which he contributed to the *Edinburgh Review*, which had attracted very considerable notice from their first appearance. Accordingly, pursuant to notice, he moved for a variety of accounts and returns, and during the spring of that year called the attention of the house at different times to the important subject of the circulating medium and bullion trade. At the same time that Mr. Horner was establishing his reputation as an economist, he

neglected not the other duties of a statesman. On the 10th of May, 1810, when Alderman Combe made a motion censuring the ministers for obstructing the address of the Livery of London to his majesty in person, we find Mr. Horner supporting it in the following constitutional terms: "He considered it as a question of vital importance, respecting which ministers had attempted to defend themselves by drawing the veil from the infirmities of their sovereign. It was the right of the Livery of London, as it was of other subjects, to have access to his majesty's person in the worst times—even in those of Charles II. these had not been refused. The most corrupt ministers indeed had no idea it would ever be refused. How complete would have been their triumph if they had discovered the practice which of late had prevailed! The obstruction of petitions was a subversion of the fundamental law of the land." Towards the conclusion of the same session the house marked its sense of Mr. Horner's superior information by placing his name at the head of "the bullion committee." Mr. Horner presided for some time as chairman of that committee during the examination of the evidence, and drew up the first part of the report; the second was penned by Mr. Huskisson; and the third by Mr. Henry Thornton. They reported "that there was an excess in the paper circulation, of which the most unequivocal symptoms were the high price of bullion,¹ and next to that the low state of the continental exchange;² that the cause of this excess was to be found in the suspension of cash-payments, there being no adequate provision against such an excess, except in the convertibility of paper into specie; and that the unfavourable state of the exchange originated in the same cause, and was farther increased by the anti-commercial measures of the enemy." They added "that they could see no sufficient remedy for the present, or security for the future, except the repeal of the law suspending the cash-payments of the bank; this, they thought, could not be safely done at an earlier period than two years from the time of their report; but they recommended that early provision should be made by parliament for this purpose." This report excited much discussion both within and without the walls of the house. The press swarmed with pamphlets on the present state of the currency and the remedies proposed;—the journals teemed with dissertations on the same subject;—the comparative merits of a metallic and a paper currency formed the topic of discussion in every company;—ministers opposed the committee's proposition;—and finally, Mr. Vansittart, at the head of the anti-bullionists or *practical men*, as they called themselves, got a series of counter-resolutions passed after four nights' keen discussion, in which the speeches of Mr. Horner and several other members extended to three hours' length.

Although defeated in their struggle, the appearance which Mr. Horner made in it was so highly respectable as to deepen the impression which his talents and knowledge had already made on the house; and from this period he appears to have exercised very considerable influence with all parties. Indeed, the urbanity of his manners, and the moderation with which he pressed his own views, were such as secured for him the respect, at least, of those from whom he differed in opinion; and while steadily and consistently supporting the party to which he belonged, he displayed a spirit of tolerance towards his opponents

¹ Gold had attained a maximum of 15½ per cent. above the mint price.

² The exchanges on Hamburg and Amsterdam had been depressed towards the latter end of 1809 from 16 to 20 per cent. below par; while the exchange on Paris was still lower.

which totally subdued anything like personal animosity on their part. His efforts were then often more successful than those of more gifted men, who, with greater talents, have nevertheless greater prejudice, frequently amounting to personal dislike, to struggle against. It has been supposed that had Mr. Horner been in parliament after the death of Mr. Ponsonby, he would have become the leader of the opposition. But for an honour so great as this Providence had not destined him. Constant application to business and the increasing weight and multiplicity of his engagements at last overpowered a constitution which never was very strong. Indications of pulmonary consumption soon appeared, and immediate removal to a warmer climate was deemed necessary by his physicians. Crossing, therefore, to the Continent, he passed through France and entered Italy; but the seeds of mortal disease had begun to spring before he took farewell of his own country, and he expired at Pisa on the 8th of February, 1817, in the thirty-eighth year of his age. His remains were interred in the Protestant burying-ground at Leghorn, which also contains the ashes of Smollett.

On the occasion of a new writ being moved for the borough of St. Mawes, which Mr. Horner had represented, the character of the deceased member was elegantly sketched by Lord Morpeth, and eloquent and affecting tributes of respect paid to his memory by several of the most distinguished members of the house.

A contemporary, who was acquainted with Mr. Horner both at school and at the university, thus expresses his opinion of him: "The characteristics of Mr. Horner's mind, if I apprehend them rightly, were clearness of perception, calmness of judgment, and patience of investigation: producing as their consequences, firmness of conduct and independence of principles. Carrying these qualities into public life, he evinced greater moderation and forbearance than are often found in the narrow and comparatively unambitious strifes of a less extended scene. He entered parliament at rather an early age, and soon became not only a useful and conspicuous man of business, but drew more respect to his personal character, and was regarded by both orders of the House of Commons with greater confidence and interest, than any young member had attracted, perhaps, since the early days of Mr. Pitt. This will appear higher praise when it is added, with truth, that no man coming into that house under the patronage of a Whig nobleman could have acted with greater liberality towards extended ideas of popular right—with more fairness and firmness to the persons of his opponents—or with more apparent latitude of individual judgment, on some of the most trying occasions, in all those scenes that have occurred in our recent parliamentary history. As a public speaker, he was not remarkable for the popular graces and attractions. If eloquence consists in rousing the passions by strong metaphors—in awakening the sympathies by studied allusions—or in arresting attention by the sallies of a mind rich in peculiar associations, Mr. Horner was not eloquent. But if eloquence be the art of persuading by accurate reasoning, and a right adjustment of all the parts of a discourse, by the powers of a tact which is rather intellectually right than practically fine, Mr. Horner was eloquent. He spoke with the steady calmness of one who saw his way on principle, while he felt it simply and immediately, through sobriety of judgment and good conduct; and never seemed to be more excited by his subject, or more carried away in the vehemence of debate, than to make such ex-

ertions as left one uniform impression on the minds of his hearers that he spoke from an honest internal conviction and from a real desire to be useful. In private life he was distinguished by an impressive graveness which would have appeared heavy had it not been observed in permanent conjunction with an easy steadiness of conversation, and a simplicity of manners very far from anything cold, affected, or inelegant. His sense of honour was high and decided. His taste for literature, like his taste for conduct, was correct. As his acts of friendship or of duty were done without effort or finesse, so did he enjoy with quietness and relish those tender and deeply felt domestic affections which can sweeten or even adorn almost any condition of life. He was not fitted to win popularity, but his habitual moderation—his unaffected respect for everything respectable that was opposed to him—and the successful pains which he took to inform himself well on the grounds and nature of every business in which he bore a part, gained him an influence more valuable to a man of judgment than popularity."

Mr. Horner sat to the celebrated Raeburn for his picture some years before his demise. The painter has produced a faithful likeness, but no engraving of it has yet been executed.

HORSBURGH, JAMES, F.R.S. This eminent hydrographer, whose charts have conferred such inestimable benefits upon our merchant princes and the welfare of our eastern empire, was a native of Fife, that county so prolific of illustrious Scotchmen from the earliest periods of our national history. James Horsburgh was born at Elie on the 23d September, 1762. As his parents were of humble rank, his education in early life at the village school was alternated with field-labour. Being intended, like many of those living on the coast of Fife, for a seafaring life, his education was directed towards this destination; and at the age of sixteen, having acquired a competent knowledge of the elements of mathematics, navigation, and book-keeping, he entered his profession in the humble capacity of cabin-boy, to which he was bound apprentice for three years. During this time the different vessels in which he served were chiefly employed in the coal trade, and made short trips to Ostend, Holland, and Hamburg. These were at length interrupted in May, 1780, in consequence of the vessel in which he sailed being captured by a French ship off Walcheren, and himself with his shipmates sent to prison at Dunkirk. When his captivity, which was a brief one, had ended, he made a voyage to the West Indies, and another to Calcutta; and at this last place he found an influential friend in Mr. D. Briggs, the ship-builder, by whose recommendation he was made third mate of the *Nancy*. For two years he continued to be employed in the trade upon the coasts of India and the neighbouring islands, and might thus have continued to the end with nothing more than the character of a skilful, hardy, enterprising sailor, when an event occurred by which his ambition was awakened, and his latent talents brought into full exercise. In May, 1786, he was sailing from Batavia to Ceylon, as first mate of the *Atlas*, and was regulating the ship's course by the charts used in the navigation of that sea, when the vessel was unexpectedly run down and wrecked upon the island of Diego Garcia. According to the map he was in an open sea, and the island was elsewhere, until the sudden crash of the timbers showed too certainly that he had followed a lying guide. The loss of this vessel was repaid a thousand-fold by the effects it produced. James Horsburgh saw the neces-

sity for more correct charts of the Indian Ocean than had yet been constructed, and he resolved to devote himself to the task, by making and recording nautical observations. The resolution from that day was put in practice, and he began to accumulate a store of nautical knowledge that served as the materials of his future productions in hydrography.

In the meantime Horsburgh, a shipwrecked sailor, made his way to Bombay, and, like other sailors thus circumstanced, looked out for another vessel. This he soon found in the *Gunjawa*, a large ship employed in the trade to China; and for several years after he sailed in the capacity of first mate in this and other vessels between Bombay, Calcutta, and China. And during this time he never lost sight of the resolution he had formed in consequence of his mishap at Diego Garcia. His notes and observations had increased to a mass of practical knowledge that only required arrangement; he had perfected himself by careful study in the whole theory of navigation, and during the short intervals of his stay in different ports had taught himself the mechanical part of his future occupation by drawing and etching. It was time that these qualifications should be brought into act and use by due encouragement, and this also was not wanting. During two voyages which he made to China by the eastern route he had constructed three charts, one of the Strait of Macassar, another of the west side of the Philippine Islands, and a third of the tract from Dampier Strait through Pitt's Passage towards Batavia, each of these accompanied with practical sailing directions. He presented them to his friend and former shipmate Mr. Thomas Bruce, at that time at Canton; and the latter, who was well fitted to appreciate the merits of these charts, showed them to several captains of India ships, and to Mr. Drummond, afterwards Lord Strathallan, then at the head of the English factory at Canton. They were afterwards sent home to Mr. Dalrymple, hydrographer to the East India Company, and published by the court of directors for the benefit of their eastern navigation, who also transmitted a letter of thanks to the author, accompanied with the present of a sum of money for the purchase of nautical instruments. In 1796 he returned to England in the *Carron*, of which he was first mate; and the excellent trim in which he kept that vessel excited the admiration of the naval connoisseurs of our country, while his scientific acquirements introduced him to Sir Joseph Banks, Dr. Maskelyne, the royal astronomer, and other men distinguished in science. After a trip to the West Indies, in which the *Carron* was employed to convey troops to Porto Rico and Trinidad, he obtained in 1798 the command of the *Anna*, a vessel in which he had formerly served as mate, and made in her several voyages to China, Bengal, and England. All this time he continued his nautical observations, not only with daily but hourly solicitude. His care in this respect was rewarded by an important discovery. From the beginning of April, 1802, to the middle of February, 1804, he had kept a register every four hours of the rise and fall of the mercury in two marine barometers, and found that while it regularly ebbed and flowed twice during the twenty-four hours in the open sea, from latitude 26° N. to 26° S., it was diminished, and sometimes wholly obstructed, in rivers, harbours, and straits, owing to the neighbourhood of the land. This fact, with the register by which it was illustrated, he transmitted to the Royal Society, by whom it was published in the *Philosophical Transactions* for 1805. Having also purchased, at Bombay, the astronomical clock used by the French ships that had been sent in quest of the unfortunate *La Perouse*, he used it in

ascertaining the rates of his own chronometers, and in making observations upon the immersions and emersions of Jupiter's satellites, which he forwarded to the Greenwich Observatory. About the same period he constructed a chart of the Straits of Allas, and sent it, with other smaller surveys, to Mr. Dalrymple, by whom they were engraved.

It was now full time that Captain Horsburgh should abandon his precarious profession, which he had learned so thoroughly, and turn his useful acquirements to their proper account. It was too much that the life of one upon whose future labours the safety of whole navies was to depend, should be exposed to the whiff of every sudden gale, or the chance starting of a timber. Already, also, he had completed for publication a large collection of charts, accompanied with explanatory memoirs of the voyages from which they had been constructed, and these, with his wonted disinterestedness, he was about to transmit to his predecessor Mr. Dalrymple. Fortunately, Sir Charles Forbes interposed, and advised him to carry them home and publish them on his own account; and as Horsburgh was startled at the idea of the expense of such a venture in authorship, his whole savings amounting by this time to no more than £5000 or £6000, the great Indian financier soon laid his anxieties to rest, by procuring such a number of subscribers for the work in India as would more than cover the cost of publishing. Thus cheered in his prospects, Captain Horsburgh returned to England in 1805, and forthwith commenced his important publication, from which his memory was to derive such distinction, and the world such substantial benefit. So correct were these charts, that even this very correctness, the best and most essential quality of such productions, threatened to prevent their publication; for with such accuracy and minuteness were the bearings and soundings of the harbour of Bombay laid down, that it was alleged they would teach an enemy to find the way in without the aid of a pilot. It was no wonder indeed that these soundings were so exact; for he had taken them with his own hands, during whole weeks, in which he worked from morning till night under the fire of a tropical sun. In the same year that he returned to England he married, and had by this union a son and two daughters, who survived him. In 1806 he was elected a fellow of the Royal Society; and in 1810 he was appointed hydrographer to the East India Company, by the court of directors, on the death of Mr. Dalrymple. Just before this appointment, however, he published his most important work, entitled *Directions for Sailing to and from the East Indies, China, New Holland, the Cape of Good Hope, and the Interjacent Ports*. These *Directions*, undertaken at the request of several navigators of the eastern seas, and compiled from his journals and observations during twenty-one years, have ever since continued to be the standard and text-book of eastern ocean navigation.

On being appointed hydrographer to the East India Company, Mr. Horsburgh devoted himself, with all his wonted application, to the duties of his office. He constructed many new charts, the last of which was one of the east coast of China, with the names of the places in Chinese and English; and published an *Atmospherical Register* for indicating storms at sea, besides editing Mackenzie's *Treatise on Marine Surveying*, and the *East India Pilot*. From 1810, the year of his appointment, till 1836, the year of his death, he was indefatigable in that great work of humanity to which he may be said to have ultimately fallen a martyr—for his long-continued labours among the scientific documents contained in the cold vaults and crypts of the India House, and his close

attention to the countless minutiae of which the science of hydrography is composed, broke down a constitution that, under other circumstances, might have endured several years longer. But even while he felt his strength decaying, he continued at his post until it was exchanged for a death-bed. His last labour, upon which he tasked his departing powers to the uttermost, was the preparation of a new edition of his *Directions for Sailing*, &c., his favourite work, published in 1809, to which he had made large additions and improvements. He had completed the whole for the press except the index, and in his last illness he said to Sir Charles Forbes, "I would have died contented had it pleased God to allow me to see the book in print!" His final charge was about the disposal of his works, so that they might be made available for more extensive usefulness; and to this the directors of the East India Company honourably acceded, while they took care that his children should be benefited by the arrangement. He died of hydrothorax on the 14th of May, 1836. His works still obtain for him the justly merited title of "The Nautical Oracle of the World." It is pleasing also to add, that the lessons which he learned from his pious affectionate father before he left the paternal roof, abode with him in all his subsequent career: he was distinguished by the virtues of gentleness, kindness, and charity; and even amidst his favourite and absorbing studies, the important subject of religion employed much of his thoughts. This he showed by treatises which he wrote in defence of church establishments, where his polemic theology was elevated and refined by true Christian piety. Of these occasional works, his pamphlet of *A National Church Vindicated* was written only a few months before his death.

HORSLEY, JOHN, an eminent antiquary, historian, and divine, was born at Pinkie House in Mid-Lothian, in the year 1685. His parents were English nonconformists, who are supposed to have fled into Scotland on account of the persecution in the reign of Charles II. How it happened that they resided at Pinkie House, then the property of the Earl of Dunfermline, as successor to the estates of the abbey of Dunfermline, is not known. It is clearly ascertained that his progenitors belonged to Northumberland, and were of no mean standing. His parents returned to Northumberland immediately after the Revolution, and it is understood that the subject of this notice received the initiatory part of his education at the Newcastle grammar-school. He was thereafter sent to pursue his academical studies at Edinburgh; and it would appear that, at a very early age, as we find by the laureation book of the college, he was admitted Master of Arts in 1701, being then just sixteen years of age. After finishing his theological course he returned to England, and preached for several years merely as a licentiate; but in 1721 he was ordained minister of a congregation of Protestant dissenters at Morpeth. His mind, however, was directed to other pursuits besides his profession, and his great attainments in geology, mathematics, and most of the other abstruse sciences, of which he gave unquestionable proofs, would probably have gained him a wider and more permanent fame in the present day than at a time when their principles were in general little understood, and less attended to. In 1722 he invented a simple and ingenious mode of determining the average quantity of rain which fell by means of a funnel, the wider cylinder of which was thirty inches in diameter, and terminated in a pipe three inches in diameter and ten in length; the latter being graduated in inches

and tenths. Ten measures of the pipe being equal to one inch of the cylinder, one measure to one-tenth of an inch, one inch of the measure to one-hundredth, and one-tenth to one-thousandth part—the depth of any particular quantity of rain which fell might be set down in decimals with ease and exactness; and the whole, at the end of each month or year, summed up without any trouble. Shortly after, and probably in consequence of this invention, he was elected a fellow of the Royal Society, and commenced giving public lectures on hydrostatics, mechanics, and various branches of natural philosophy, at Morpeth, Alnwick, and Newcastle. His valuable apparatus for illustrating and explaining his lectures, having passed through various hands after his death, were in 1821 deposited in the library belonging to the dissenters in Red Cross Street, London, being bequeathed to the public by Dr. Daniel Williams. By manuscripts afterwards found among Mr. Horsley's papers, it appears that about the year 1728 he conceived the idea of writing a history of Northumberland, and from the extensive design of the work which he had sketched out, embracing its antiquities, traditions, geological structure, &c., and his ability for the task, it is much to be regretted that he did not live to complete it. A map of the same county, commenced by him, was afterwards completed by Mr. Mark, the surveyor employed by him, and published at Edinburgh in 1753. Mr. Horsley also published a small book on experimental philosophy, in connection with the course of lectures above noticed. His great work, however, by which his name will most probably be transmitted to posterity, and to which he dedicated the greater part of his short but busy career, is his *Britannia Romana*, or the Roman affairs of Britain, in three books. This work is in folio, and consists of 520 pages, with plates exhibiting maps of the Roman positions, copies of ancient coins, sculptures, inscriptions, &c. It is dedicated to Sir Richard Elllys, Bart., contains a lengthy preface, a chronological table of occurrences during the Roman domination, a copious index of the Roman names of people and places in Britain, &c. It was printed at London for John Osborne and Thomas Longman, &c., in 1732; but Mr. Horsley lived not to see the fate of a work which had unceasingly engrossed his time, thoughts, and means for several years. His death took place at Morpeth, on the 15th January, 1732, exactly thirteen days after the date of his dedication to Sir Richard Elllys, and while yet in his forty-sixth year. The enthusiastic ardour with which he devoted himself to this work may be gleaned from the following passage in the preface:—"It is now four years since I was prevailed with to complete this work, for which time I have pursued it with the greatest care and application. Several thousand miles were travelled, to visit ancient monuments and re-examine them where there was any doubt or difficulty." He also went to London to superintend the progress of his work through the press, and engaged in an extensive correspondence on the subject with many of the most learned writers and antiquaries of the day. The *Britannia* is now a very rare work, and it would appear that the plates engraved for it are entirely lost. Mr. Horsley was married early in life to a daughter of a Professor Hamilton, who, according to Wood in his *Ancient and Modern State of Cramond*, was at one time minister of that parish. By her he had two daughters, one of whom was married to a Mr. Randall, clerk in the Old South Sea House, London; the other to Samuel Halliday, Esq., an eminent surgeon at Newcastle. From a passage in his manu-

script history of Northumberland, it would also appear that he had a son, but we find no other mention made of him, either in his own writings or elsewhere. The greater part of Mr. Horsley's various unfinished works, correspondence, and other manuscripts, fell after his death into the hands of John Cay, Esq. of Edinburgh, great-grandson of Mr. Robert Cay, an eminent printer and publisher at Newcastle, to whose judgment in the compiling, correcting, and getting up of the *Britannia Romana* Mr. Horsley appears to have been much indebted. From these papers, as printed in a small biographical work by the Rev. John Hodgson, vicar of Whelpington in Northumberland, published at Newcastle in 1831, the most of the facts contained in this brief memoir were taken.

HUME, ALEXANDER, a vernacular poet of the reign of James VI., was the second son of Patrick Hume, fifth Baron of Polwarth. Until revived by the tasteful researches of Dr. Leyden, the works of this, one of the most elegant of our early poets, lay neglected, and his name was unknown except to the antiquary. He had the merit of superseding those "godlie and spiritual sangis and ballatis," which, however sacred they may have once been held, are pronounced by the present age to be ludicrous and blasphemous, with strains where piety and taste combine, and in which the feelings of those who wish to peruse writings on sacred subjects are not outraged. The neglect which has long obscured the works of this poet has impeded inquiries as to his life and character. He is supposed to have been born in the year 1560, or within a year or two prior to that date. Late investigators have found that he studied at St. Andrews, and that he may be identified with an Alexander Hume, who took the degree of Bachelor of Arts at St. Leonard's College of that university in the year 1574. The outline of his further passage through life is expressed in his own words, in his epistle to Mr. Gilbert Moncrieff, the king's physician. He there mentions, that, after spending four years in France, he was seized with a desire to become a lawyer in his own country, and he there draws a pathetic picture of the miseries of a briefless barrister, sufficient to extract tears from half the faculty.

"To that effect, three years, or near that space,
I haunted maist our highest pleading place
And senate, where great causes reason'd war;
My breast was bruist with leaning on the bar;
My buttons brist, I partly spittid blood,
My gown was trail'd and trampid quhair I stood;
My ears were deif'd with maissars cryes and din
Quhilk procurators and parties callit in."

Nor did the moral aspect of the spot convey a more soothing feeling than the physical. He found

"The puir abusit ane hundredth divers wayes;
Postpon'd, deffer'd with shifts and mere delays,
Consumit in gudes, ourset with grief and paine."

From the corrupt atmosphere of the law he turned towards the pure precincts of the court; but here he finds that

"From the rocks of Cyclades fra hand,
I struck into Charybdis sinking sand."

He proceeds to say that, "for reverence of kings he will not slander courts," yet he has barely maintained his politeness to royal ears in his somewhat vivid description of all that the calm poet experienced during his apprenticeship at court.

"In courts, Montcrieff, is pride, envie, contention,
Dissimulation, despite, disceat, dissention,
Fear, whisperings, reports, and new suspicion,
Fraud, treason, lies, dread, guile, and sedition;
Great greedines and prodigalitie;
Lusts sensual, and partialtie,"

with a continued list of similar qualifications, whose applicability is likely to be perceived only by a disappointed courtier or a statesman out of place. During the days of his following the bar and the court, it is supposed that Hume joined in one of those elegant poetical amusements called "flytings," and that he is the person who, under the designation of "Polwart," answered in fitting style to the abuse of Montgomery. That Alexander Hume was the person who so officiated is, however, matter of great doubt: Dempster, a contemporary, mentions that the person who answered Montgomery was *Patrick Hume*, a name which answers to that of the elder brother; and though Leyden and Sibbald justly pay little attention to such authority, knowing that Dempster is, in general, as likely to be wrong as to be right, every Scotsman knows that the patrimonial designation "Polwart" is more appropriately the title of the elder than of the younger brother; while Patrick Hume of Polwarth, a more fortunate courtier, and less seriously disposed than his brother, has left behind him no mean specimen of his genius in a poem addressed to James VI., entitled the *Promise*. Whichever of the brothers has assumed Polwart's share in the controversy, it is among the most curious specimens of the employments of the elegant minds of the age.

If the sacred poet Alexander Hume was really the person who so spent his youthful genius, as life advanced he turned his attention to more serious matters: that his youth was spent more unprofitably than his riper years approved is displayed in some of his writings, in terms more bitter than those which are generally used by persons to whom expressions of repentance seem a becoming language. He entered into holy orders, and at some period was appointed minister of Logie, a pastoral charge of which he performed with vigour the humble duties, until his death in 1609.

Before entering on the works which he produced in his clerical retirement, it may be right to observe that much obscurity involves his literary career, from the circumstance that three other individuals of the same name, existing at the same period, passed lives extremely similar, both in their education and in their subsequent progress. Three out of the four attended St. Mary's College at St. Andrews in company;—presuming that the subject of our memoir took his degree of Bachelor of Arts in 1574, one of his companions must have passed in 1571, the other in 1572. It is supposed that one of these was minister of Dunbar in 1582; the other is known to have been appointed master of the high-school of Edinburgh in 1596, and to have been author of a few theological tracts, and of a Latin grammar, appointed by act of parliament and by the privy-council to be used in all grammar-schools in the kingdom: this individual has been discovered by Dr. M'Crie to have afterwards successively officiated as rector of the grammar-schools of Salt-Preston and of Dunbar. The fourth Alexander Hume was a student at St. Leonard's College, St. Andrews, where he entered in 1578.

Alexander Hume, minister of Logie, is, however, the undoubted author of "*Hymnes or Sacred Songs*," wherein the right Use of Poesie may be espied: whereunto are added, the Experience of the Author's Youth, and certain Precepts serving to the Practice of Sanctification." This volume, printed by Waldegrave in 1599, was dedicated to Elizabeth Melvill, by courtesy styled Lady Culross, a woman of talent and literary habits, the authoress of *Ane Godlie Dream, compylit in Scottish Meter*, printed at Aberdeen in 1644. The *Hymnes and Sacred Songs* have been several times partially reprinted, and the original

having fallen into extreme rarity, the whole has been reprinted by the Bannatyne Club. In the prose introduction the author, addressing the youth of Scotland, exhorts them to avoid "profane sonnets and vain ballads of love, the fabulous feats of Palmerine, and such like reveries."—"Some time," he adds, "I delighted in such fantasies myself, after the manner of riotous young men: and had not the Lord in his mercy pulled me aback, and wrought a great repentance in me, I had doubtless run forward and employed my time and study in that profane and unprofitable exercise, to my own perdition." The first of his hymns he styles his "Recantation:" it commences in the following solemn terms:—

"Alas! how long have I delayed
To leave the laits¹ of youth!
Alas! how oft have I essayed
To sweeten my lascivious mouth,
And made my wayne polluted thought,
My pen and speech prophaine,
Extoll the Lord quihilk made of nocht
The heaven, the earth, and maine,
Scarce nature yet my face about
Her virile net had spun,
Quhen als off as Phœbea stout
Was set against the Sun:
Yea, als it is the fierie flames
Arise and shine abroad,
I minded none such songs and psalms
To glorifie my God.

But ay the cancred carnall kind,
Quhilk lurked me within,
Seduced my heart, withdrew my mind,
And made me slave to sin.
My senses and my saull I saw
Debait a deadlie strife,
Into my flesh I felt a law
Gainstand the law of life.

Even as the falcon high, and hait,
Furth fleeing in the skye,
With wanton wing her game to gair,
Disdaines her caller's cry;
So led away with liberty,
And drowned in delight,
I wandered after vanitie—
My vice I give the wight."

But by far the most beautiful composition in the collection is that entitled the "Day Estival," the one which Leyden has thought worthy of revival. This poem presents a description of the progress and effects of a summer day in Scotland, accompanied by the reflections of a mind full of natural piety, and a delicate perception of the beauties of the physical world. The easy flow of the numbers, distinguishing it from the harsher productions of the same age, and the arrangement of the terms and ideas, prove an acquaintance with English poetry; but the subject and the poetical thoughts are entirely the author's own. They speak strongly of the elegant and fastidious mind, tired of the bar and disgusted with the court, finding a balm to the wounded spirit in being alone with nature, and watching her progress. The style has an unrestrained freedom which may please the present age, and the contemplative feeling thrown over the whole, mingled with the artless vividness of the descriptions, bringing the objects immediately before the eye, belong to a species of poetry at which some of the highest minds have lately made it their study to aim. We shall quote the commencing stanza, and a few others scattered in different parts of the poem:—

"O perfect light! which shedd away
The darkness from the light,
And left one ruler o'er the day,
Another o'er the night;
Thy glory, when the day forth flies,
More vividly does appear,
Nor at mid-day unto our eyes
The shining sun is clear.

¹ Habits or manners.

The shadow of the earth anone
Removes and drawis by;
Synne in the east, when it is gone
Appears a clearer sky:
Which soon perceives the little larks,
The lapwing, and the snipe;
And tunes their songs, like nature's clerks.
O'er meadow, moor, and stripe.

The time so tranquil is and still,
That no where shall ye find,
Save on a high and barren hill,
An air of passing wind.
All trees and simples, great and small,
That balmy leaf do bear.
Nor they were painted on a wall
No more they move or stir.
Calm is the deep and purpore sea,
Yea smoother now the sand:
The waves that weltering wont to be
Are stable like the land.

What pleasure 'twere to walk and see,
Endlong a river clear,
The perfect form of every tree
Within the deep appear:
The salmon out of crooves and creele
Up hauled into skouts,
The bells and circles on the weills
Through louping of the trouts.
O then it were a seemly thing,
While all is still and calme,
The praise of God to play and sing
With cornet and with shalme."

Rowe, in his manuscript *History of the Church of Scotland*, has told us that Hume "was one of those godlie and faithful servants who had witnessed against the hierarchy of prelates in this kirk." He proceeds to remark, "as to Mr. Alexander Hoome, minister at Logie, beside Stirling, I nixt mention him: he has left ane admonition behind him in write to the Kirk of Scotland, wherein he affirms that the bishops, who were then fast rising up, had left the sincere ministers, who wold gladlie have kepted still the good old government of the kirk, if these corrupt ministers had not left them and it; earnestlie entreating the bishops to leave and forsake that course wherein they were, els their defection from their honest brethren (with whom they had taken the covenant), and from the cause of God, would be registrate afterwards to their eternale shame." The person who has reprinted Hume's *Hymnes and Sacred Songs* for the Bannatyne Club has discovered, among the elaborate collections of Wodrow in the Advocates' Library, a small tract, entitled *Ane Afoid Admonition to the Ministerie of Scotland, be ane Deing Brother*, which he, not without reason, presumes to be that mentioned by Rowe; founding the supposition on the similarity of the title, the applicability of the matter, and a minute circumstance of internal evidence, which shows that the admonition was written very soon after the year 1607, and very probably at such a period as might have enabled Hume (who died in 1609) to have denominated himself "ane deing brother." The whole of this curious production is conceived in a style of assumption which cannot have been very acceptable to the spiritual pride of the Scottish clergy. It commences in the following terms of apostolical reprimand:—"Grace, mercy, and peace, from God the Father, through our Lord Jesus Christ. It is certainlie knawin, bretheren, to the greiff of monie godlie heartes and slander of the gospell, that thair ar dissentionis among you: not concerning the covenant of God, or the scales of the covenant, but chieflie concerning twa poyntis of discipline or kirk government, wharant you are divydit in twa factionis or opinionis." From this assumed superiority, the admonitionist stalks forth, bearing himself in lofty terms, never condescending to argue, but directing like a superior spirit; and

under the Christian term of humility, "bretheren," concealing an assumption of spiritual superiority, which the word "sons" would hardly have sufficiently expressed.

HUME, DAVID, of Godscroft. The scantiness of the materials for lives of literary Scotsmen has, with us, often been a subject of remark and regret; and we are sure that every one who has had occasion to make investigations into this department of our national history will at once acquiesce in its truth. Our statesmen have been applauded or condemned—at all events they have been immortalized—by contemporary writers; the deeds of our soldiers have been celebrated in works relative to our martial achievements; and our divines have always, and more especially in the darker ages, preserved a knowledge of themselves and their transactions,—but literary men are nearly forgotten, and for what is known of them we are principally indebted to the labours of continental biographers. It would be difficult to point out a more striking illustration of this than the well-known individual whose name appears at the head of this article. His name is familiar to every one who is in the least degree conversant with Scottish history or poetry;—he was descended from an honourable family—he acted a prominent part in some of the earlier transactions of his own time—and still almost nothing is known of his history. The indefatigable Wodrow has preserved many scattered hints regarding him in his *Biographical Collections* in the library of Glasgow College, and except this we are not aware of any attempt at a lengthened biographical sketch of him. In drawing up the following we shall take many of our facts from that biography, referring also to the excellent works of Dr. M'Crie, and occasionally supplying deficiencies from the few incidental notices of himself in Hume's works.

David Hume, it is probable, was born about, or a few years prior to, the period of the Reformation. His father was Sir David Hume, or Home, of Wedderburn, the representative of an old and distinguished family in the south of Scotland. His mother was Mary Johnston, a daughter of Johnston of Elphinstone. This lady died early, and her husband, after having married a second wife, who seems to have treated his family in a harsh and ungenerous manner, died of consumption while the subject of this memoir was a very young man. The family thus left consisted of four sons—George, David, James, and John; and four daughters—Isabell, Margaret, Julian, and Joan.

Of the early education of David Hume we have not been able to learn almost anything. His elder brother and he were sent to the public school of Dunbar, then conducted by Mr. Andrew Simson, and there is abundant evidence that he made very considerable progress in the acquisition of classical knowledge. He has left a poem entitled *Daphn-Amaryliss*, written at the age of fourteen, and he incidentally mentions the expectations George Buchanan formed of his future eminence from his early productions. After receiving, it may be conjectured, the best education that a Scottish university then afforded, Hume set out for France, accompanied by his relation John Haldane of Gleneagles. His intention was to have also made the tour of Italy, and for that purpose he had gone to Geneva, when his brother's health became so bad as to make his return desirable. On receiving the letters containing this information he returned to Scotland without delay, "and arrived," to use his own words in his *History of the Family of Wedderburn*, "much about the time that Esme, Lord Aubigny (who was afterwards made Duke of Lennox), was brought into Scotland—and that

Morton began to decline in his credit, he being soon after first imprisoned, and then put to death;" that is, about the beginning of 1581.

Sir George Home seems to have recovered his health soon afterwards, and David was generally left at his castle to manage his affairs, while he was engaged in transactions of a more difficult or hazardous nature. This probably did not continue long, for the earliest public transaction in which we have found him engaged took place in 1583. When King James VI. withdrew from the party commonly known by the name of the Ruthven Lords, and readmitted the Earl of Arran to his councils, Archibald, "the good Earl" of Angus, a relation of Hume's family, was ordered to confine himself to the north of Scotland, and accordingly resided for some time at the castle of Brechin, the property of his brother-in-law the Earl of Mar. At this period Hume seems to have lived in Angus' house in the capacity of a "familiar servitour," or confidential secretary.

When the Ruthven party were driven into England Hume accompanied his master and relation; and while the lords remained inactive at Newcastle, requested leave to go to London, where he intended pursuing his studies. To this Angus consented, with the ultimate intention of employing him as his agent at the English court. During the whole period of his residence at the English capital he maintained a regular correspondence with the earl, but only two of his letters (which he has printed in the *History of the Houses of Douglas and Angus*) have come down to us.

The Ruthven Lords returned to Scotland in 1585, but soon offended the clergy by their want of zeal in providing for the security of the church. Their wrath was still farther kindled by a sermon preached at this time before the king at Linlithgow, by John Craig, in which the offensive doctrine of obedience to princes was enforced. A letter was accordingly prepared, insisting upon the claims of the church, and transmitted to Mr. Hume, to be presented to Angus. A very long conference took place betwixt the earl and Hume, which he has set down at great length in the above-mentioned work. He begins his own discourse by refuting the arguments of Craig, and shows, that although it is said in his text, "I said ye are gods," it is also said, "Nevertheless ye shall die;" "which two," Hume continues, "being put together, the one shows princes their duty—*Do justice as God doth*; the other threateneth punishment—*Ye shall die if you do it not*." He then proceeds to show that the opinions of Bodinus in his work *De Republica*, and of his own countryman Blackwood [see BLACKWOOD], are absurd; and having established the doctrine that tyrants may be resisted, he applies it to the case of the Ruthven Lords, and justifies the conduct of Angus as one of that party. He then concludes in the following strain of remonstrance:—"Your declaration which ye published speaks much of the public cause and common weal, but you may perceive what men think of your actions since they do not answer thereto by this letter, for they are begun to think that howsoever you pretend to the public, yet your intention was fixed only on your own particular, because you have done nothing for the church or country, and have settled your own particular. And it is observed, that of all the parliaments that were ever held in this country, this last, held since you came home, is it in which alone there is no mention of the church, either in the beginning thereof (as in all others there is), or elsewhere throughout. This neglect of the state of the church and country, as it is a blemish of your fact, obscuring the lustre of it, so is it accounted an error in policy by so doing,

to separate your particular from the common cause of this bar and country, which, as it hath been the mean of your particular restitution, so is it the only mean to maintain you in this estate, and to make it sure and firm."

During the subsequent short period of this earl's life Hume seems to have retained his confidence, and to have acted the part of a faithful and judicious adviser. After Angus' death, which took place in 1588, it is probable that he lived in retirement. Accordingly, we do not find any further notice of him till he appeared as an author in 1605.

One of King James' most favourite projects was the union of the kingdoms of England and Scotland, and soon after his accession to the English throne commissioners were appointed to consider the grounds upon which this object could be safely and advantageously attained. It would altogether exceed our limits were we to give even a faint outline of the proceedings of these commissioners, and it is the less necessary as their deliberations did not lead to the desired result. The subject, however, met with the attention of the most learned of our countrymen. The first work written on this subject was from the pen of Robert Pont, one of the most respectable clergymen of his day, and a senator of the College of Justice, while ecclesiastics were permitted to hold that office. His work, which was published in 1604, is in the form of a dialogue between three imaginary personages—Irenæus, Polyhistor, and Hesperus, and is now chiefly interesting as containing some striking remarks on the state of the country and the obstacles to the administration of justice. Pont was followed by David Hume, our author, who published next year his treatise *De Unione Insule Britannia*, of which Bishop Nicholson only says that "it is written in a clear Latin style, such as the author was eminent for, and is dedicated to the king: it shows how great an advantage such a union would bring to the island in general, and in particular to the several nations and people of England and Scotland, and answers the objections against the change of the two names into that of Britain—the alteration of the regal style in writs and processes of law—the removal of the parliament and other courts into England," &c. The first part only of this work of Hume's was published. Bishop Nicholson mentions that a MS. of the second part was in Sir Robert Sibbald's collection, and Wodrow also possessed what he considered a very valuable copy of it.

In the year 1608 Hume commenced a correspondence on the subject of Episcopacy and Presbytery with James Law, then Bishop of Orkney, and afterwards promoted to the archiepiscopal see of Glasgow. This epistolary warfare took its rise in a private conversation between Mr. Hume and the bishop, when he came to visit the presbytery of Jedburgh in that year. The subject presented by much too large a field to be exhausted at a private meeting, and accordingly supplied materials for their communications for about three years. But here again we are left to lament that so little of it has been preserved. Calderwood has collected a few of the letters, but the gaps are so frequent, and consequently so little connection is kept up, that they would be entirely uninteresting to a general reader. In 1613 Hume began a correspondence of the same nature with Bishop Cowper on his accepting the diocese of Galloway. The bishop set forth an apology for himself, and to this Hume wrote a reply, which, however, was not printed, as it was unfavourable to the views of the court. Cowper answered his statements in his *Dicaio*, but printed only such parts of Hume's argument as could be most easily

refuted. To this Hume once more replied at great length.

Shortly before this period he undertook the *History of the House of Wedderburn*, (written) by a Son of the Family, in the year 1611—"a work which has hitherto remained in manuscript. "It has sometimes grieved me," he remarks, in a dedication to the Earl of Home and to his own brother, "when I have been glancing over the histories of our country, to have mention made so seldom of our ancestors—scarce above once or twice—and that too very shortly and superficially; whereas they were always remarkable for bravery, magnanimity, clemency, liberality, munificence, hospitality, fidelity, piety in religion, and obedience to their prince; and indeed there never was a family who had a greater love and regard for their country, or more earnestly devoted themselves to, or more frequently risked their lives for, its service. It ought, in a more particular manner, to grieve you that they have been so long buried in oblivion; and do you take care that they be so no more. I give you, as it were, the prelude, or lay the ground-work of the history; perhaps a pen more equal to the task, or at least who can do it with more decency, will give it the finishing stroke." He does not enter into a minute inquiry into the origin of the family, a species of antiquarianism of which it must be confessed our Scottish historians are sufficiently fond:—"My intention," he says, "does not extend farther than to write those things that are peculiar to the house of Wedderburn." The work begins with "David, first laird of Wedderburn," who appears to have lived about the end of the fourteenth century, and concludes with an account of the earlier part of his brother's life.

During the latter period of his life Hume appears to have devoted himself almost entirely to literary pursuits. He had appeared before the world as a poet in his *Lusus Poetici*, published in 1605, and afterwards incorporated into the excellent collection entitled *Delicia Poetarum Scotorum*, edited by Dr. Arthur Johnston. He seems to have added to his poetical works when years and habits of study might be supposed to have cooled his imaginative powers. When Prince Henry died he gave vent to his grief in a poem entitled *Henrici Principis Juxta*, which, Wodrow conjectures, was probably sent to Sir James Semple of Beltrees, then a favourite at court, and by whom it is not improbable that it was shown to his majesty. A few years afterwards (1617) he wrote his *Regi Svo Graticulatio*—a congratulatory poem on the king's revisiting his native country. In the same year he prepared (but did not publish) a prose work under the following title, "*Cambdenia*; id est, Examen nonnullorum a Gulielmo Cambdeno in 'Britannia' sua positorum, præcipue quæ ad irrisionem Scotice gentis, et eorum et Pictorum falsam originem." "In a very short preface to his readers," says Wodrow, "Mr. Hume observes that nothing more useful to this island was ever proposed, than the union of the two islands, and scarce ever any proposal was more opposed; witness the insults in the House of Commons, and Paget's fury, rather than speech, against it, for which he was very justly fined. After some other things to the same purpose, he adds, that Mr. Cambden hath now in his *Britannia* appeared on the same side, and is at a small labour to extol to the skies England and his Britons, and to depress and expose Scotland—how unjustly he does so is Mr. Hume's design in this work." Cambden's assertions were also noticed by William Drummond in his *Nuntius Scoto-Britannus*, and in another of his works more professedly levelled against him, entitled *A Pair of Spectacles for Cambden*.

The last work in which we are aware of Hume's having been engaged, is his largest, and that by which he is best known. The *History of the House and Race of Douglas and Angus* seems to have been first printed at Edinburgh by Evan Tyler in 1644, but this edition has several discrepancies in the title-page. Some copies bear the date 1648, "to be sold by T. W. in London;" and others have a title altogether different, "*A Generall History of Scotland*, together with a particular History of the Houses of Douglas and Angus," but are without date. After mentioning in the preface that, in writing such a work, it is impossible to please all parties—that some may say that it is an unnecessary work—others, that it is merely a party-statement—and a third complain of "the style, the phrase, the periods, the diction, and the language," Hume goes on to say, "In all these particulars, to satisfy all men is more than we can hope for; yet thus much shortly of each of them to such as will give ear to reason: that I write, and of this subject, I am constrained to do it, not by any violence or compulsion, but by the force of duty, as I take it; for, being desired to do it by those I would not refuse, I thought myself bound to honour that name, and in it and by it, our king and country. . . . Touching partiality, I deny it not, but am content to acknowledge my interest. Neither do I think that ever any man did set pen to paper without some particular relation of kindred, country, or such like. The Romans in writing the Romano, the Grecians in writing their Greek histories; friends writing to, of, or for friends, may be thought partial, as countrymen and friends. The virtuous may be deemed to be partial towards the virtuous, and the godly towards the godly and religious; all writers have some such respect, which is a kind of partiality. I do not refuse to be thought to have some, or all of these respects, and I hope none will think I do amiss in having them. Pleasing of men, I am so farre from shunning of it, that it is my chief end and scope: but let it please them to be pleased with virtue, otherwise they shal find nothing here to please them. If thou findest anything here besides, blame me boldly; and why should any be displeased that wil be pleased with it? would to God I could so please the world, I should never displease any. But if either of these (partiality or desire to please) carry me besides the truth, then shal I confess myself guilty, and esteem these as great faults, as it is faultie and blame-worthy to forsake the truth. But otherwise, so the truth be stuck unto, there is no hurt in partiality and labouring to please. And as for truth, clip not, nor champ not my words (as some have done elsewhere), and I beleeve the worst affected will not charge mee with lying. I have ever sought the truth in all things carefully, and even here also, and that painfully in every point: where I find it assured, I have set it down confidently; where I thought there was some reason to doubt, I tell my authour: so that if I deceive, it is my self I deceive, and not thee; for I hide nothing from thee that I myself know, and as I know it, leaving place to thee, if thou knowest more or better, which, if thou doest, impart and communicate it; for so thou shouldest do, and so is truth brought to light, which else would lye hid and buried. My paines and travel in it have been greater than every one would think, in correcting my errors; thine will not bee so much, and both of us may furnish matter for a third man to finde out the truth more exactly, than either of us hath yet done. Help, therefore, but carp not. . . . For the language, it is my mother-tongue, that is, Scottish: and why not, to Scottish men? why should I contemne it? I never thought the difference so great, as that by seeking to speak

English, I would hazard the imputation of affectation. Every tongue hath its own vertue and grace. Some are more substantiall, others more ornate and succinct. They have also their own defects and faultinesses; some are harsh, some are effeminate, some are rude, some affectate and swelling. The Romanes spake from their heart, the Grecians with their lips only, and their ordinary speech was complements; especially the Asiatick Greeks did use a loose and blown kind of phrase. And who is there that keeps that golden mean? For my own part, I like our own, and he that writes well in it, writes well enough to me. Yet I have yeilded somewhat to the tyrannie of custome and the times, not seeking curiously for words, but taking them as they come to hand. I acknowledge also my fault (if it be a fault), that I ever accounted it a mean study, and of no great commendation to learn to write or to speak English, and have loved better to bestow my pains and time on foreign languages, esteeming it but a dialect of our own, and that perhaps more corrupt." The work commences with a preface concerning "the Douglasses in general, that is, their antiquity, to which is joined their original, nobility, and descent, greatness and valour of the family of the name of Douglas." The history begins with Sholto Douglas, the first that bore the name, and the vanquisher of Donald Bane in the reign of King Salvathius, and concludes with the death of Archibald ninth Earl of Angus, who has been already noticed in the course of this memoir. With this work closes every trace of David Hume of Godscroft. It is supposed to have been written about 1625, or between that period and 1630, and it is not probable that he survived that period long. Supposing him to have been born about 1560, he must then have attained to the age of three-score years and ten.

Respecting Hume's merits as a poet, different opinions exist. While in the estimation of Dr. Irving he never rises above mediocrity, Dr. M'Crie places him in a somewhat higher rank:—"The easy structure of his verse reminds us continually of the ancient models on which it has been formed; and if deficient in vigour, his fancy has a liveliness and buoyancy which prevents the reader from wearying of his longest descriptions." These opinions are, after all, not irreconcilable; the poetry of Hume possesses little originality; but the reader is charmed with the readiness and the frequency of his imitations of the Roman poets.

As a historian Hume can never become popular. He is by much too prolix—nor will this be wondered at when we consider the age at which he wrote his principal historical work. To the reader, however, who is disposed to follow him through his windings, he will be a most valuable, and in many cases a most amusing author. As the kinsman of the Earls of Angus, he had access to many important family papers, from which he has compiled the history prior to his own time. But when he writes of transactions within his own recollection, and more especially those in which he was personally engaged, there is so much judicious remark and honesty of intention, that it cannot fail to interest even a careless reader.

Besides the works which we have mentioned, Hume wrote "*Apologia Basilica, seu Machiavelli Ingenium Examinatum*, in libro quem inscripsit Princeps, 4to, Paris, 1626." *De Episcopatu*, May 1, 1609, *Patricio Simsono*; *A Treatise on Things Indifferent*; *Of Obedience to Superiors*. In the *Biographie Universelle* there is a memoir of him, in which it is mentioned that "Jaques Iier. l'employé à concilier les differends qui s'estaient élevé entre Dumoulin et Tilenus au sujet de la justification,"

and he is also there mentioned as having written *Le Contrat Social, ou l'origine de la Justice*, Geneva, 1712, 8vo, and "*L'Amateur du Roi*, ou Maximes Pratiques en la Personne du Delfaut Henric le Grand," 1717, 8vo.

HUME, DAVID, the celebrated metaphysician, historian, and political economist, was the second son of Joseph Hume of Ninewells, near Dunse, and was born in the Tron Church parish, Edinburgh, on the 26th of April, 1711, o.s. His mother was daughter to Sir David Falconer, a judge of the Court of Session, under the designation of Lord Newton, and for some years president of the College of Justice. The family of Hume of Ninewells was ancient and respectable, and the great philosopher has himself informed us, that on the side both of father and mother he was the descendant of nobility, a circumstance from which he seems to have derived a quiet satisfaction, probably owing more to his respect for the manners and feelings of the country and age in which he lived, than to his conviction of the advantages of noble birth. It is to be regretted that little is known about the early life of Hume, and the habits of his boyish years. In early infancy he was deprived of his father, and left to the guidance of his mother and an elder brother and sister; with the brother, who succeeded by birthright to the family property, he ever lived on terms of fraternal intimacy and affection, and towards his two female relatives he displayed through all the stages of his life an unvarying kindness and unremitted attention, which have gone far, along with his other social virtues, in causing him to be respected as a man by those who were his most bitter opponents as a philosopher.

The property of the respectable family of Ninewells was not large, and the limited share which fell to the younger brother precluded the idea of his supporting himself without labour. He attended for some time the university of Edinburgh, then rising in reputation; and of his progress in study he gives us the following account:—"I passed through the ordinary course of education with success, and was seized very early with a passion for literature, which has been the ruling passion of my life, and the great source of my enjoyments; my studious disposition, my sobriety, and my industry, gave my family a notion that the law was a proper profession for me: but I found an insurmountable aversion to everything but the pursuits of philosophy and general learning; and while they fancied I was poring upon Voet and Vinnius, Cicero and Virgil were the authors I was secretly devouring."¹ Of this aversion not only to the *practice*, but to the abstract *study*, of the law, in a mind constituted like that of Hume, guided by reason, acute in the perception of differences and connections, naturally prone to industry, and given up to the indulgence neither of passion nor sentiment, it is difficult to account.

In 1734 the persuasions of his friends induced Mr. Hume to attempt the bettering of his income by entering into business, and he established himself in the office of a respectable merchant in Bristol; but the man who had rejected the study of the law was not likely to be fascinated by the bustle of commerce, and probably in opposition to the best hopes and wishes of his friends, in a few months he relinquished his situation, and spent some years in literary

retirement in France, living first at Rheims, and afterwards at La Flèche in Anjou. "I there," he says, "laid that plan of life which I have steadily and successfully pursued. I resolved to make a very rigid frugality supply my deficiency of fortune, to maintain unimpaired my independency, and to regard every object as contemptible, except the improvement of my talents in literature;" and with the consistency of a calm and firm mind he kept his resolution. For some time previous to this period Hume must have been gradually collecting that vast mass of observation and reflection which he employed himself during his retirement in digesting into the celebrated *Treatise on Human Nature*. In 1737 he had finished the first two volumes of this work, and he then returned to London to superintend their publication. From this date commenced the earliest traces of that literary and social correspondence which furnishes many of the most characteristic commentaries on the mental habits of the philosopher. With Henry Home, afterwards Lord Kames, a near neighbour of the family of Ninewells, and probably a connection of the philosopher (for *he* was the first member of the family who adopted the name of *Hume*, in preference to the family name *Home*), he contracted an early friendship, and a similarity of pursuits continued the intercourse. To that gentleman we find the subject of our memoir writing in the following terms, in December, 1737:—"I have been here near three months, always within a week of agreeing with my printers: and you may imagine I did not forget the work itself during that time, when I began to feel some passages weaker for the style and diction than I could have wished. The nearness and greatness of the event roused up my attention, and made me more difficult to please than when I was alone in perfect tranquillity in France." The remaining portion of this communication, though given in the usual placid and playful manner of the author, tells a painful tale of the difficulties he had to encounter, and of hope deferred. "But here," he says, "I must tell you one of my foibles. I have a great inclination to go down to Scotland this spring to see my friends, and have your advice concerning my *philosophical discoveries*; but cannot overcome a certain shame-facedness I have to appear among you at my years without having got a settlement, or so much as attempted any. How happens it, that we philosophers cannot as heartily despise the world as it despises us? I think in my conscience the contempt were as well founded on our side as on the other." With this letter Mr. Hume transmitted to his friend a manuscript of his *Essay on Miracles*, a work which he at that period declined publishing along with his other productions, looking on it as more likely to give offence, from the greater reference of its reasonings to revealed religion.

Towards the termination of the year 1738 Hume published his "*Treatise on Human Nature*," being an Attempt to Introduce the Experimental Method of Reasoning into Moral Subjects." The fundamental principles on which the whole philosophy of this work is reared, discover themselves on reading the first page, in the division of all perceptions—in other words, of all the materials of knowledge which come within the comprehension of the human mind—into impressions and ideas. Differing from almost all men who, using other terms, had discussed the same subject, he considered these two methods of acquiring knowledge to differ, not in quality, but merely in degree; because by an observation of the qualities of the mind, on the principle of granting nothing which could not be demonstrated, he could find no real ground of distinction, excepting that the one set

¹ It is almost unnecessary to mention, that when we use the words of Hume about himself, we quote from that curious little memoir called *My Own Life*, written by Hume on his death-bed, and published in 1777, by Mr. Strahan (to whom the manuscript was consigned), previously to its publication in the ensuing edition of the *History of England*.

of perceptions was always of a more vivid description than the other. The existence of *impressions* he looked on as prior in the mind to the existence of *ideas*, the latter being merely dependent on or reflected from the former, which were the first inlets of all knowledge. Among *perceptions* he considered the various methods by which the senses make the mind acquainted with the external world, and along with these, by a classification which might have admitted a better arrangement, he ranked the *passions*, which he had afterwards to divide into those which were the direct consequents of the operations of the senses, as *pain* and *pleasure*, and those which the repetition of impressions, or some other means, had converted into concomitants, or qualifications of the mind, as *hatred*, *joy*, *pride*, &c. By *ideas* Mr. Hume understood those arrangements of the perceptions formed in the mind by *reasonings* or *imagination*; and although he has maintained the distinction between these and the *impressions* of the senses to be merely in degree, all that has been either blamed or praised in his philosophy is founded on the use he makes of this distinction. He has been accused, and not without justice, of confusion in his general arrangement, and disconnection in the subjects he has discussed as allied to each other; but a careful peruser of his works will find the division of subject we have just attempted to explain, to pervade the whole of his extraordinary investigations, and never to be departed from where language allows him to adhere to it. The *ideas*, or more faint *perceptions*, are made by the author to be completely dependent on the *impressions*, showing that there can be no given *idea* at any time in the mind, to which there has not been a corresponding *impression* conveyed through the organs of sense. These ideas once existing in the mind are subjected to the operation of the memory, and form the substance of our thoughts, and a portion of the motives of our actions. Thus, at any given moment, there are in the mind two distinct sources of knowledge (or of what is generally called knowledge)—the impressions which the mind is receiving from surrounding objects through the senses, and the thoughts which pass through the mind, modified and arranged from such impressions previously experienced and stored up. Locke, in his arguments against the existence of innate ideas, and Dr. Berkeley, when he tried to show that the mind could contain no abstract ideas (or ideas not connected with anything which the mind had experienced), had formed the outline of a similar division of knowledge; but neither of them founded on such a distinction a system of philosophy, nor were they, it may be well conceived, aware of the extent to which the principles they suggested might be logically carried. The division we have endeavoured to define is the foundation of the sceptical philosophy. The knowledge immediately derived from *impressions* is that which truly admits the term "knowledge" to be strictly applied to it; that which is founded on *experience*, derived from *previous impressions*, is something which always admits of doubt. While the former are always certain, the mind being unable to conceive their uncertainty, the latter may not only be conceived to be false, but are so much the mere subjects of probability, that there are distinctions in the force which the mind attributes to them—sometimes admitting them to be doubtful, and making no more distinction, except in the greater amount of probabilities betwixt that which it pronounces doubtful and that which it pronounces certain. As an instance, when a man looks upon another man, and hears him speak, he receives through the senses of hearing and sight certain impressions, the existence

of which he cannot doubt; on that man, however, being no longer the object of his senses, the impressions are arranged in his mind in a reflex form, constituting what Mr. Hume has called ideas: and although he may at first be convinced in a manner sufficiently strong for all practical purposes that he has actually seen and heard such a man, the knowledge he has is only a mass of probabilities, which not only admit him to conceive it a possibility that he may *not* have met such a man, but actually decay by degrees, so as probably after a considerable period to lapse into uncertainty, while no better line of distinction can be drawn betwixt the certainty and the uncertainty, than that the one is produced by a greater mass of probabilities than the other. The author would have been inconsistent had he admitted the reception of knowledge of an external world, even through the medium of the senses: he maintained all that the mind had really cognizance of to be the *perceptions* themselves; there was no method of ascertaining with certainty what caused them. The human mind then is thus discovered to be nothing but a series of perceptions, of which some sets have such a resemblance to each other that we always naturally arrange them together in our thoughts. Our consciousness of the identity of any given individual is merely a series of perceptions so similar, that the mind glides along them without observation. A man's consciousness of his own identity is a similar series of impressions. "The mind," says the author, "is a kind of theatre, where several perceptions successively make their appearance—pass, repass, glide away, and mingle in an infinite variety of postures and situations. There is properly no *simplicity* in it at one time, nor *identity* in different, whatever natural propensity we may have to imagine that simplicity and identity. The comparison of the theatre must not mislead us. They are the successive perceptions only that constitute the mind; nor have we the most distant notion of the place where these scenes are represented, or of the materials of which it is composed."¹ From such a conclusion the passage to scepticism on the immateriality of the soul was a natural and easy step: but on such a subject we must be cautious as to the manner in which we make remarks on the observations made by Hume—we neither appear as among his vindicators, nor for the purpose of disputing his conclusions—our purpose is, as faithful biographers, to give, as far as our limits and our knowledge of the subject may admit, a sketch of his leading doctrines; and if we have anything to vindicate, it will be the author's real meaning, which certain zealous defenders of Christianity have shown an anxiety to turn as batteries against it. In his reasonings on the immateriality of the soul he is truly sceptical; that is, while he does not *deny* the immateriality of the soul, he endeavours to show that the mind can form no certain conception of the immaterial soul. Refining on the argument of a reasoning poet, who probably was not aware of the full meaning of his own words when he said—

— "Of God above, or man below,
What can we reason, but from what we know?"

the author of the *Treatise on Human Nature* maintained that the mere succession of impressions, of which the mind was composed, admitted of no such impression as that of the immateriality of the soul, and consequently did not admit of the mind comprehending in what that immateriality consisted. Let it be remembered, that this conclusion is come to in the same manner as that against the consciousness

¹ *Works* 1826, i. 322.

of the mind to the existence of matter; and that in neither case does the author maintain certain opinions which men believe to be *less certain* than they are generally conceived to be, but gives to them a name different from that which language generally bestows on them—that of *masses of probabilities* instead of *certainities*—the latter being a term he reserves solely for the impressions of the senses. “Should it here be asked me,” says the author, “whether I sincerely assent to this argument, which I seem to take such pains to inculcate, and whether I be really one of those sceptics who hold that all is uncertain, and that our judgment is not in *any* thing possessed of *any* measures of truth and falsehood; I should reply, that this question is entirely superfluous, and that neither I, nor any other person, was ever sincerely and constantly of that opinion. Nature, by an absolute and uncontrollable necessity, has determined us to judge as well as to breathe and feel; nor can we any more forbear viewing certain objects in a stronger and fuller light, upon account of their customary connection with a present impression, than we can hinder ourselves from thinking as long as we are awake, or seeing the surrounding bodies when we turn our eyes towards them in broad sunshine. Whoever has taken the pains to refute the cavils of this *total* scepticism has really disputed without an antagonist, and endeavoured by arguments to establish a faculty which nature has antecedently implanted in the mind and rendered unavoidable.”¹ With this extremely clear statement, which shows us, that while Hume had a method of accounting for the sources of our knowledge differing from the theories of other philosophers, in the abstract certainty which he admitted to pertain to any knowledge beyond the existence of an impression, his belief in the ordinary admitted sources of human knowledge was not less practically strong than that of other people,—let us connect the concluding words of the chapter on the immortality of the soul: “There is no foundation for any conclusion *a priori*, either concerning the operations or duration of any object, of which it is possible for the human mind to form a conception. Any object may be imagined to become entirely inactive, or to be annihilated in a moment: and it is an evident principle that *whatever we can imagine is possible*. Now this is no more true of matter than of spirit—of an extended compounded substance, than of a simple and unextended. In both cases the metaphysical arguments for the immortality of the soul are equally inconclusive; and in both cases the moral arguments, and those derived from the analogy of nature, are equally strong and convincing. If my philosophy therefore makes no addition to the arguments for religion, I have at least the satisfaction to think it takes nothing from them, but that everything remains precisely as before.”² Without pretending to calculate the ultimate direction of the philosophy of Hume, as it regards revealed religion, let us repeat the remark, that many persons busied themselves in increasing its terrors as an engine against the Christian faith, that they might have the merit of displaying a chivalrous resistance. The presumptions thus formed and fostered caused a vigorous investigation into the grounds of all belief, and many good and able men were startled to find that it was necessary to admit many of the positions assumed by their subtle antagonist, and that they must employ the vigorous logic they had brought to the field in stoutly fortifying a position he did not attack. They found “the metaphysical arguments inconclusive,” and “the moral arguments, and those derived from the analogy

of nature, equally strong and convincing:” and that useful and beautiful system of natural theology which has been enriched by the investigations of Derham, Tucker,³ and Paley, gave place to obscure investigations into first causes, and idle theories on the grounds of belief, which generally landed the philosophers in a circle of confusion, and amazed the reader with incomprehensibilities. One of the most clear and original of the chapters of the *Treatise on Human Nature* has provided us with a curious practical instance of the pliability of the sceptical philosophy of Hume. In treating the subject of cause and effect, Mr. Hume, with fidelity to his previous division of perceptions, found nothing in the effect produced on the mind by any two phenomena, of which the one received the name of cause, the other that of effect, but two *impressions*, and no connection betwixt them, but the sequence of the latter to the former; attributing our natural belief that the one is a cause, and the other its effect, to the habit of the mind in running from the one impression to that which is its immediate sequent or precedent; denying that we can have any conception of cause and effect beyond those instances of which the mind has had experience, and which habit has taught it; and finally, denying that mankind can penetrate farther into the mystery than the simple knowledge that the one phenomenon is experienced to follow the other. Men of undoubtedly pure religious faith have maintained the justness of this system as a metaphysical one, and it has found its way into physical science, as a check to vague theories and the assumption of conjectural causes: in a memorable instance it was, however, attacked as *metaphysically* subversive of a proper belief in the Deity as a first cause. The persons who maintained this argument were answered, that an opposite supposition was *morally* subversive of a necessity for the constant existence and presence of the Deity; because, if “a cause had the innate power within it of producing its common effect, the whole fabric of the universe had an innate power of existence and progression in its various changes, which dispensed with the existence of a supreme regulator.”

The second volume of the *Treatise on Human Nature* discusses the passions on the principles laid down at the commencement of the previous volume. The subjects here treated, while they are not of so strikingly original a description as to prompt us to enlarge on their contents, may be a more acceptable morsel to most readers, and certainly may be perused with more of what is termed satisfaction, than the obscure and somewhat disheartening investigations of the pure metaphysician. Of the usual subtlety and acuteness of the author they are of course not destitute; but the theatre of investigation does not admit of much abstraction, and these qualities exercise themselves on subjects more tangible and comprehensible than those of the author's prior labours.

The production of the *Treatise on Human Nature* stands almost alone in the history of the human mind. Let it be remembered that the author had just reached that period of existence when the animal spirits exercise their strongest sway, and those whom nature has gifted with talents and observation are exulting in a brilliant world before them, of which they are enjoying the prospective felicity without tasting much of the bitterness; and that this extensive treatise, so varied in the subjects embraced, so

³ Not Josiah, but Abraham Tucker, who, under the assumed name of “Search,” wrote a book on the light of nature, in 9 vols. 8vo. An unobtrusive and profound work, not very inviting, and little read, which later philosophers have pillaged without compunction.

² *Works*, i. p. 319.

patiently collected by a lengthened labour of investigation and reflection, and entering on views so adverse to all that reason had previously taught men to believe, and so repulsive to the common feelings of the world, was the first literary attempt which the author deigned to place before the public. Perhaps a very close examination of the early habits and conduct of the author, could the materials of such be obtained, would scarcely furnish us with a clue to so singular a riddle; but in a general sense, we may not diverge far from the truth in supposing that the circumstances of his earlier intercourse with the world had not prompted the author to entertain a very charitable view of mankind, and that the bitterness thus engendered coming under the cognizance of his reflective mind, instead of turning him into a stoic and practical enemy of his species, produced that singular system which, holding out nothing but doubt as the end of all mortal investigations, struck a silent blow at the dignity of human nature, and at much of its happiness. In a very singular passage he thus speaks of his comfortless philosophy, and of the feelings it produces in the mind of its Cain-like fabricator. "I am first affrighted and confounded with that forlorn solitude in which I am placed in my philosophy, and fancy myself some strange uncouth monster who, not being able to mingle and unite in society, has been expelled all human commerce, and left utterly abandoned and disconsolate. Fain would I run into the crowd for shelter and warmth, but cannot prevail with myself to mix with such deformity. I call upon others to join me in order to make a company apart, but no one will hearken to me. Every one keeps at a distance, and dreads that storm which beats upon me from every side. I have exposed myself to the enmity of all metaphysicians, logicians, mathematicians, and even theologians; and can I wonder at the insults I must suffer? I have declared my disapprobation of their systems; and can I be surprised if they should express a hatred of mine and of my person? When I look abroad, I foresee on every side dispute, contradiction, anger, calumny, and detraction. When I turn my eye inward, I find nothing but doubt and ignorance. All the world conspires to oppose and contradict me: though such is my weakness, that I feel all my opinions loosen and fall of themselves when unsupported by the approbation of others. Every step I take is with hesitation, and every new reflection makes me dread an error and absurdity in my reasoning."¹ In the same spirit he writes to his friend Mr. Henry Home, immediately after the publication of the *Treatise*: "Those," he says, "who are accustomed to reflect on such abstract subjects are commonly full of prejudices; and those who are unprejudiced, are unacquainted with metaphysical reasonings. My principles are also so remote from all the vulgar sentiments on the subject, that were they to take place they would produce almost a total alteration in philosophy; and you know revolutions of this kind are not easily brought about."²

Hume, when the reflection of more advanced life, and his habits of unceasing thought, had made a more clear arrangement in his mind of the principles of his philosophy, found many things to blame and alter in his treatise, not so much in the fundamental arguments, as in their want of arrangement, and the obscure garb of words in which he had clothed them. On the feelings he entertained on this subject we find him afterwards writing to Dr. John Stewart, and we shall here quote a rather mutilated fragment of this epistle, which has hitherto been

unprinted, and is interesting as containing an illustration of his arguments on belief:—"Allow me to tell you that I never asserted so absurd a proposition, as that anything might arise without a cause. I only maintained that our certainty of the falsehood of that proposition proceeded neither from intuition nor demonstration, but from another source. That Cesar existed, that there is such an island as Sicily; for these propositions, I affirm, we have no demonstration nor intuitive proof. Would you infer that I deny their truth, or even their certainty? and some of them as satisfactory to the mind, though perhaps not so regular, as the demonstrative kind. Where a man of sense mistakes my meaning, I own I am angry, but it is only with myself, for having expressed my meaning so ill as to have given occasion to the mistake. That you may see I would no way scruple of owning my mistakes in argument, I shall acknowledge (what is infinitely more material) a very great mistake in conduct; viz. my publishing at all the *Treatise on Human Nature*, a book which pretended to innovate in all the sublimest parts of philosophy, and which I composed before I was five and twenty. Above all, the positive air which pervades that book, and which may be imputed to the ardour of youth, so much displeases me, that I have not patience to review it. I am willing to be unheeded by the public, though human life is so short that I despair of ever seeing the decision. I wish I had always confined myself to the more easy paths of erudition; but you will excuse me from submitting to proverbial decision, let it even be in Greek."

The effect produced on the literary world by the appearance of the *Treatise on Human Nature*, was not flattering to a young author. "Never literary attempt," says Mr. Hume, "was more unfortunate than my *Treatise on Human Nature*. It fell *dead-born from the press*, without reaching such distinction as even to excite a murmur among the zealots. But being naturally of a cheerful and sanguine temper, I very soon recovered the blow, and prosecuted with great ardour my studies in the country." The third part of Mr. Hume's *Treatise on Human Nature* was published in 1740: it treated the subject of morals, and was divided into two parts, the first discussing "Virtue and Vice in general," the second treating of "Justice and Injustice." The scope of this essay is to show that there is no abstract and certain distinction betwixt moral good and evil; and while it admits a sense of virtue to have a practical existence in the mind of every human being (however it may have established itself), it draws a distinction betwixt those virtues of which every man's sense of right is capable of taking cognizance; and justice, which it maintains to be an artificial virtue, erected certainly on the general wish of mankind to act rightly, but a virtue which men do not naturally follow, until a system is invented by human means, and based on reasonable principles of general utility to the species, which shows men what is just and what is unjust, and can best be followed by the man who has best studied its general artificial form, in conjunction with its application to utility, and who brings the most acute perception and judgment to assist him in the task.³ Before publishing this part of the work Hume submitted the manuscript to Francis Hutcheson,

³ Thus this portion of the system bore a considerable resemblance to the theory so elaborately expounded in the *Leviathan* of Hobbes, with this grand distinction, that Hume, while maintaining the necessity that a system of justice should be framed, does not maintain that it had its origin in the natural injustice of mankind, and their hatred of each other, nor does he attribute the formation of the system to a complicated social contract, like that which occurred to the mind of the Malinesbury philosopher.

professor of moral philosophy in the university of Glasgow, whose opinions he was more disposed to receive with deference than those of any other man. Nevertheless, it was only in matters of detail that he would consent to be guided by that eminent person. The fundamental principles of the system he firmly defended. The correctness of which passed between them shows how far Hume saw into the depths of the utilitarian system, and proves that it was more completely formed in his mind than it appeared in his book. "To every virtuous action (says he) there must be a motive or impelling passion distinct from the virtue, and virtue can never be the sole motive to any action." The greater plainness of the subject, and its particular reference to the hourly duties of life, made this essay more interesting to moral philosophers, and laid it more widely open to criticism, than the *Treatise on the Understanding*, and even that on the *Passions*. The extensive reference to principles of utility produced discussions to which it were an idle and endless work here to refer; but without any disrespect to those celebrated men who have directly combated the principles of this work, and supported totally different theories of the formation of morals, those who have twisted the principles of the author into excuses for vice and immorality, and the destruction of all inducements to the practice of virtue, deserve only the fame of being themselves the fabricators of the crooked morality of which they have endeavoured to cast the odium upon another. When Mr. Hume said, "The necessity of justice to the support of society is the sole foundation of that virtue: and since no moral excellence is more highly esteemed, we may conclude that this circumstance of usefulness has in general the strongest energy, and most entire command over our sentiments. It must, therefore, be the source of a considerable part of the merit ascribed to humanity, benevolence, friendship, public spirit, and other social virtues of that stamp; as it is the sole source of the moral approbation paid to fidelity, justice, veracity, integrity, and those other estimable and useful qualities and principles:"—when he said this, it was not difficult for those benevolent guardians of the public mind who sat in watch to intercept such declarations, to hold such an opinion up to public indignation, and to maintain that it admitted every man to examine his actions by his own sense of their utility, and to commit vice by the application of a theory of expediency appropriated to the act.

The neglect with which his first production was received by the public, while it did not abate the steady industry of its author, turned his attention for a time to subjects which might be more acceptable to general readers, and in the calm retirement of his brother's house at Ninewells, where he pursued his studies with solitary zeal, he prepared two volumes of unconnected dissertations, entitled *Essays Moral and Philosophical*, which he published in 1742. These essays he had intended to have published in weekly papers, after the method pursued by the authors of the *Spectator*; "but," he observes, in an advertisement prefixed to the first edition, "having dropped that undertaking, partly from laziness, partly from want of leisure, and being willing to make trial of my talents for writing before I ventured upon any more serious compositions, I was induced to commit these trifles to the judgment of the public." A few of the subjects of these essays are the following: "Of the Delicacy of Taste and Passion," "That Politics may be reduced to a Science," "Of the Independency of Parliament," "Of the Parties in Great Britain," "Of Superstition and Enthusiasm," "Of Liberty and Despotism," "Of Eloquence,"

"Of Simplicity and Refinement," "A Character of Sir Robert Walpole," &c. Of these miscellaneous productions we cannot venture the most passing analysis in a memoir which must necessarily be brief: of their general character it may be sufficient to say, that his style of writing, which in his *Treatise* was far from approaching the purity and elegance of composition which he afterwards displayed, had made a rapid advance to excellence, and that the reading world quickly discovered from the justness and accuracy of his views, the elegance of his sentiments, and the clear precision with which he stated his arguments, that the subtle calculator of the origin of all human knowledge could direct an acute eye to the proceedings of the world around him, and that he was capable of making less abstract calculations on the motives which affected mankind. A few of these essays, which he seems to have denounced as of too light a nature to accompany his other works, were not republished during his life; among the subjects of these are "Impudence and Modesty," "Love and Marriage," "Avarice," &c. Although these have been negatively stigmatized by their author, a general reader will find much gratification in their perusal: the subjects are handled with the careless touch of a satirist; and in drawing so lightly and almost playfully pictures of what is contemptible and ridiculous, one can scarcely avoid the conviction that such is the aspect in which the author wishes to appear. But on the other hand there is such a complete absence of all grotesqueness, of exaggeration, or attempt at ridicule, that it is apparent he is drawing a picture of what he knows to be unchangeably rooted in human nature, and that knowing raillery to be useless, he is content as a philosopher merely to depict the deformity which cannot be altered. Among the essays he did not republish, is the "Character of Sir Robert Walpole," a singular specimen of the author's ability to abstract himself from the political feelings of the time, calmly describing the character of a living statesman, whose conduct was perhaps more feverishly debated by his friends and enemies than that of almost any minister in any nation, as if he were a person of a distant age, with which the author had no sympathy, or of a land with which he was only acquainted through the pages of the traveller. It was after the publication of this work that Hume first enjoyed the gratification of something like public applause. "The work," he says, "was favourably received, and soon made me entirely forget my former disappointment." He still rigidly adhered to his plans of economy and retirement, and continued to reside at Ninewells, applying himself to the study of Greek, which he had previously neglected. In 1745 he was invited to become tutor to the Marquis of Annandale, a young nobleman whose state of mind at that period rendered a superintendent necessary; and though the situation must have been one not conducive to study, or pleasing to such a mind as that of Hume, he found that his circumstances would not justify a refusal of the invitation, and he continued for the period of a year in the family of the marquis.

During his residence in this family, the death of Mr. Cleghorn, professor of moral philosophy in the university of Edinburgh, caused a vacancy, which Mr. Hume very naturally considered he might be capable of filling. The patrons of the university, however, and their advisers, took a different view of the matter, and judged that they would be at least more safe in considering a person of his reputed principles of philosophy as by no means a proper instructor of youth: nor were virulence and party feeling unmingled with cool judgment in fixing their

choice. The disappointment of not being able to obtain a situation so desirable as affording a respectable and permanent salary, and so suited to his studies, seems to have preyed more heavily than any other event in his life on the spirits of Mr. Hume; and with the desire of being independent of the world, he seems for a short time to have hesitated whether he should continue his studies, or at once relinquish the pursuit of philosophical fame by joining the army. During the ensuing year his desire to be placed in a situation of respectability was to a certain extent gratified, by his being appointed secretary to Lieutenant-general St. Clair, who had been chosen to command an expedition avowedly against Canada, but which terminated in a useless incursion on the coast of France. In the year 1747 General St. Clair was appointed to superintend an embassy to the courts of Vienna and Turin, and declining to accept a secretary from government, Hume, for whom he seems to have entertained a partiality, accompanied him in his former capacity. He here enjoyed the society of Sir Henry Erskine and Captain (afterwards General) Grant, and mixing a little with the world, and joining in the fashionable society of the places which he visited, he seems to have enjoyed a partial relaxation from his philosophical labours. Although he mentions that these two years were almost the only interruptions which his studies had received during the course of his life, he does not seem to have entirely neglected his pursuits as an author; in a letter to his friend Henry Home he hints at the probability of his devoting his time to historical subjects, and continues, "I have here two things going on, a new edition of my *Essays*, all of which you have seen except *one* of the "Protestant Succession," where I treat that subject as coolly and indifferently as I would the dispute betwixt Cesar and Pompey. The conclusion shows me a Whig, but a very sceptical one."¹

Lord Charlemont, who at this period met with Mr. Hume at Turin, has given the following account of his habits and appearance, penned apparently with a greater aim at effect than at truth, yet somewhat characteristic of the philosopher: "Nature I believe never formed any man more unlike his real character than David Hume. The powers of physiognomy were baffled by his countenance; neither could the most skilful in that science pretend to discover the smallest trace of the faculties of his mind in the unmeaning features of his visage. His face was broad and fat, his mouth wide, and without any other expression than that of imbecility. His eyes vacant and spiritless; and the corpulence of his whole person was far better fitted to communicate the idea of a turtle-eating alderman than of a refined philosopher. His speech in English was rendered ridiculous by the broadest Scottish accent, and his French was, if possible, still more laughable; so that wisdom, most certainly, never disguised herself before in so uncouth a garb. Though now near fifty years old,² he was healthy and strong; but his health and strength, far from being advantageous to his figure, instead of manly comeliness, had only the appearance of rusticity. His wearing a uniform added greatly to his natural awkwardness, for he wore it like a grocer of the train-bands. Sinclair was a lieutenant-general, and was sent to the courts of Vienna and Turin as a military envoy, to see that their quota of troops was furnished by the Austrians and Piedmontese. It was therefore thought necessary that his

secretary should appear to be an officer; and Hume was accordingly disguised in scarlet."³

The letter to Mr. Home we have quoted above, gives an idea of the literary employments of the author during the intervals of his official engagements at Turin, and on his return to Britain he exhibited the fruit of his labour in a second edition of his *Essays Moral and Political*, which was published in 1748, with four additional essays, and in a reconstruction of the first part of his *Treatise on Human Nature*, which he published immediately after, under the title *Philosophical Essays concerning the Human Understanding*, and formed the first part of the well-known corrected digest of the *Treatise of Human Nature* into the *Inquiry concerning Human Nature*. In the advertisement the author informs the public that "most of the principles and reasonings in this volume were published in a work in three volumes, called *A Treatise on Human Nature*, a work which the author had projected before he left college, and which he wrote and published not long after. The philosophy of this work is essentially the same as that of which he had previously sketched a more rude and complicated draught. The object (or more properly speaking, the conclusion arrived at, for the person who sets out without admissions, and inquires whether anything can be *ascertained* in philosophy, can scarcely be said to have an *object* in view) is the same system of doubt which he previously expounded; a scepticism, not like that of Boyle and others, which merely went to show the uncertainty of the conclusions attending particular species of argument, but a sweeping argument to show that by the structure of the understanding, the result of all investigations, on all subjects, must ever be doubt." The *Inquiry* must be to every reader a work far more pleasing, and we may even say instructive, than the *Treatise*. While many of the more startling arguments, assuming the appearance of paradoxes, sometimes indistinctly connected with the subject, are omitted, others are laid down in a clearer form; the whole is subjected to a more compact arrangement, and the early style of the writer, which to many natural beauties united a considerable feebleness and occasional harshness, makes in this work a very near approach to the elegance and classic accuracy which much perseverance and a refined taste enabled the author to acquire in the more advanced period of his life. Passing over, as our limits must compel us, any attempt at an analytical comparison of the two works, and a narrative of the changes in the author's opinions, we must not omit the circumstance, that the *Essay on Miracles*, which it will be remembered the author withheld from his *Treatise*, was attached to the *Inquiry*, probably after a careful revision and correction. Locke had hinted in a few desultory observations the grounds of a disbelief in the miracles attributed to the early Christian church, and Dr. Conyers Middleton, in his "Free Inquiry into the Miraculous Powers supposed to have subsisted in the Christian Church from the Earliest Ages," published very nearly at the same period with the *Essay* of Hume, struck a more decided blow at all supernatural agency beyond what was justified by the sacred Scriptures, and approached by his arguments a dangerous neighbourhood to an interference with what he did not avowedly attack. Hume considered the subject as a general point in the human understanding to which he admitted no exceptions. The argument of this remarkable *Essay* is too well known to require an explanation. Hume is repeatedly at pains to protest against his being supposed to be

¹ Tytler's *Life of Kames*.

² His lordship must have made a miscalculation. Hume was then only in his thirty-eighth year.

³ Hardy's *Life of Lord Charlemont*, p. 8.

arguing in the *Essay* against the Christian faith. These protests, however, as his biographer, Mr. Burton, is constrained to admit, were uttered briefly and coldly, and in such a manner as made people feel, that if Hume believed in the doctrines of the Bible, he certainly had not his heart in them. A want of proper deference for religious feeling (adds this writer) is a defect that runs through all his works. There is no ribaldry, but at the same time there are no expressions of decent reverence. It is to be observed, also, that the argument of Hume against miracles is still a favourite weapon of the enemies of revealed religion. At the same time, it must be admitted that, under proper regulation, the argument is of use in defining the boundaries of inductive reasoning, and in this way has proved undoubtedly serviceable to the progress of science.

The work by Dr. Campbell in confutation of this *Essay*, at first produced in the form of a sermon, and afterwards expanded into a treatise, which was published in 1762, is well known and appreciated. This admirable and conclusive production, while yet in manuscript, was shown to Hume by Dr. Blair. Hume was much pleased with the candour of the transaction; he remarked a few passages hardly in accordance with the calm feelings of the other portions of the work, which at his suggestion the author amended; and he personally wrote to Dr. Campbell, with his usual calm politeness, thanking him for treatment so unexpected from a clergyman of the Church of Scotland; and, with the statement that he had made an early resolution not to answer attacks on his opinions, acknowledged that he never felt so violent an inclination to defend himself. The respect which Campbell admitted himself to entertain for the sceptic is thus expressed:—"The *Essay on Miracles* deserves to be considered as one of the most dangerous attacks that have been made on our religion. The danger results not solely from the merit of the piece: it results much more from that of the author. The piece itself, like every other work of Mr. Hume, is ingenious; but its merit is more of the oratorical kind than of the philosophical. The merit of the author, I acknowledge, is great. The many useful volumes he has published of *history*, as well as on *criticism*, *politics*, and *trade*, have justly procured him, with all persons of taste and discernment, the highest reputation as a writer. . . . In such *analysis* and *exposition*, which I own I have attempted without ceremony or reserve, an air of *ridicule* is unavoidable; but this *ridicule*, I am well aware, if founded on *misrepresentation*, will at last rebound upon myself."¹ Dr. Campbell was a man of strong good sense, and knew well the description of argument which the world would best appreciate, approve, and comprehend, in answer to the perplexing subtleties of his opponent. He struck at the root of the system of perceptions merging into experience, and experience regulating the value of testimony, which had been erected by his adversary—and appealing, not to the passions and feelings in favour of religion, but to the common convictions which we deem to be founded on reason, and cannot separate from our minds, maintained that "testimony has a natural and original influence on belief, antecedent to experience," from which position he proceeded to show that the miracles of the gospel had received attestation sufficient to satisfy the reason.

About this period Hume suffered the loss of a mother, who, according to his own account, when speaking of his earlier days, was "a woman of singular merit, who, though young and handsome,

devoted herself entirely to the rearing of her children;" and the philosopher seems to have regarded her with a strong and devoted affection. He was a man whose disposition led him to unite himself to the world by few of the ordinary ties, but the few which imperceptibly held him were not broken without pain; on these occasions, the philosopher yielded to the man, and the cold sceptic discovered the feelings with which nature had gifted him, which at other moments lay chained by the bonds of his powerful reason. A very different account of the effect of this event, from what we have just now stated, is given in the passage we are about to quote (as copied in the *Quarterly Review*) from the *Travels* of the American Silliman. Without arguing as to the probability or improbability of its containing a true statement, let us remark that it is destitute of *proof*, a quality it amply requires, being given by the traveller forty years after the death of the philosopher, from the report of an individual, while the circumstance is not one which would have probably escaped the religious zeal of some of Mr. Hume's commentators.

"It seems that Hume received a religious education from his mother, and early in life was the subject of strong and hopeful religious impressions; but as he approached manhood they were effaced, and confirmed infidelity succeeded. Maternal partiality, however, alarmed at first, came at length to look with less and less pain upon this declension, and filial love and reverence seem to have been absorbed in the pride of philosophical scepticism; for Hume now applied himself with unwearied and unhappily with successful efforts to sap the foundation of his mother's faith. Having succeeded in this dreadful work, he went abroad into foreign countries; and as he was returning, an express met him in London, with a letter from his mother, informing him that she was in a deep decline, and could not long survive: she said she found herself without any support in her distress: that he had taken away that source of comfort upon which, in all cases of affliction, she used to rely, and that she now found her mind sinking into despair. She did not doubt but her son would afford her some substitute for her religion, and she conjured him to hasten to her, or at least to send her a letter containing such consolations as philosophy can afford to a dying mortal. Hume was overwhelmed with anguish on receiving this letter, and hastened to Scotland, travelling day and night; but before he arrived, his mother expired. No permanent impression seems, however, to have been made on his mind by this most trying event; and whatever remorse he might have felt at the moment, he soon relapsed into his wonted obduracy of heart."

On the appearance of this anecdote, Baron Hume, the philosopher's nephew, communicated to the editor of the *Quarterly Review* the following anecdote of a more pleasing nature connected with the same circumstance; and while it is apparent that it stands on better ground, we may mention that it is acknowledged by the reviewer as an authenticated contradiction to the statement of Silliman. "David and he (the Hon. Mr. Boyle, brother of the Earl of Glasgow) were both in London at the period when David's mother died. Mr. Boyle, hearing of it, soon after went into his apartment, for they lodged in the same house, where he found him in the deepest affliction, and in a flood of tears. After the usual topics of condolence Mr. Boyle said to him, 'My friend, you owe this uncommon grief to your having thrown off the principles of religion; for if you had not, you would have been consoled with the firm belief that the good lady, who was not only the best of

¹ Edit. 1797, Advert. p. viii.

mothers, but the most pious of Christians, was completely happy in the realms of the just.' To which David replied, 'Though I throw out my speculations to entertain the learned and metaphysical world, yet, in other things, I do not think so differently from the rest of mankind as you imagine.'"

Hume returned in 1749 to the retirement of his brother's house at Ninewells, and during a residence there for two years continued his remodelling of his *Treatise on Human Nature*, and prepared for the press his celebrated *Political Discourses*. The former production appeared in 1751, under the title of an *Inquiry concerning the Principles of Morals*, published by Millar, the celebrated bookseller. Hume considered this the most perfect of his works, and it is impossible to resist admiration of the clearness of the arguments, and the beautiful precision of the theories; the world, however, did not extend to it the balmy influence of popularity, and it appeared to the author that all his literary efforts were doomed to the unhappy fate of being little regarded at first, and of gradually decaying into oblivion. "In my opinion," he says "(who ought not to judge on that subject), [it] is, of all my writings, historical, philosophical, or literary, incomparably the best. It came unnoticed and unobserved into the world."

In 1752, and during the author's residence in Edinburgh, appeared his *Political Discourses*. The subjects of these admirable essays were of interest to every one, the method of treating them was comprehensible to persons of common discernment; above all, they treated subjects on which the prejudices of few absolutely refused conviction by argument, and the author had the opportunity of being appreciated and admired, even when telling truths. The book in these circumstances was, in the author's words, "the only work of mine that was successful on the first publication. It was well received abroad and at home." The chief subjects were, "Commerce, Money, Interest, the Balance of Trade, the Populousness of Ancient Nations, the Idea of a Perfect Commonwealth." Sir Josiah Child, Sir William Petty, Hobbes, and Locke had previously given the glimmerings of more liberal principles on trade and manufacture than those which they saw practised, and hinted at the common prejudices on the use of money and the value of labour; but Hume was the first to sketch an outline of some branches of the benevolent system of political economy framed by his illustrious friend Adam Smith. He laid down labour as the only criterion of all value, made a near approach to an ascertainment of the true value of the precious metals, a point not yet fully fixed among economists; discovered the baneful effects of commercial limitations as obliging the nation to trade in a less profitable manner than it would choose to do if unconstrained, and predicted the dangerous consequences of the funding system. The essay on the populousness of ancient nations was a sceptical analysis of the authorities on that subject, doubting their accuracy, on the principle of political economy that the number of the inhabitants of a nation must have a ratio to its fruitfulness and *their* industry. The essay was elaborately answered by Dr. Wallace in a *Dissertation on the Numbers of Mankind*; but that gentleman only produced a host of those "authorities," the efficacy of which Mr. Hume has doubted on principle. This essay is an extremely useful practical application of the doctrines in the *Essay on Miracles*. Mr. Hume's "Idea of a Perfect Commonwealth" has been objected to as an impracticable system. The author probably had the wisdom to make this discovery himself, and might have as soon expected it to be applicable to practice

as a geometrician might dream of his angles, straight lines, and points being literally accomplished in the measurement of an estate or the building of a house. The whole represents men without passions or prejudices working like machines; and Hume no doubt admitted, that while passion, prejudice, and habit forbade the safe attempt of such projects, such abstract structures ought to be held up to the view of the legislator, as the forms into which, so far as he can do it with safety, he ought to stretch the systems under his administration. Plato, More, Harrington, Hobbes, and (according to some accounts) Berkeley¹ had employed their ingenuity in a similar manner, and Hume seems to have considered it worthy of his attention.

In February, 1752, David Hume succeeded the celebrated Ruddiman as librarian to the Faculty of Advocates. The salary was at that time very trifling, somewhere we believe about £40, but the duties were probably little more than nominal, and the situation was considered an acquisition to a man of literary habits. It was with this ample field of authority at his command, that he seems to have finally determined to write a portion of the *History of England*. In 1757 he relinquished this appointment on his removing to London, when preparing for publication the *History of the House of Tudor*.

In 1752 appeared the first (published) volume of the *History of England*, embracing the period from the accession of the house of Stuart to the death of Charles I.; and, passing over intermediate events, we may mention that the next volume, containing a continuation of the series of events to the period of the Revolution, appeared in 1756, and the third, containing the "History of the House of Tudor," was published in 1759. "I was, I own," says the author with reference to the first volume, "sanguine in my expectations of the success of this work. I thought that I was the only historian that had at once neglected present power, interest, and authority, and the cry of popular prejudices; and as the subject was suited to every capacity, I expected proportional applause. But miserable was my disappointment; I was assailed by one cry of reproach, disapprobation, and even detestation; English, Scottish, and Irish, Whig and Tory, churchman and sectary, freethinker and religionist, patriot and courtier, united in their rage against the man who had presumed to shed a generous tear for the fate of Charles I. and the Earl of Strafford; and after the first ebullitions of their fury were over, what was still more mortifying, the book seemed to sink into oblivion." Of the second he says, "This performance happened to give less displeasure to the Whigs, and was better received. It not only rose itself, but helped to buoy up its unfortunate brother." Of the *History of England* it is extremely difficult to give a fair and unbiased opinion, because, while the author is, in general, one of the most impartial writers on this subject, it is scarcely a paradox to say, that the few partialities in which he has indulged have done more to warp the mind than the violent prejudices of others. Previous to his history, those who wrote on political subjects ranged themselves in parties, and each man proclaimed with open mouth the side for which he was about to argue, and men heard him as a special pleader. Hume looked over events with the eye of a philosopher; he seemed to be careless of the extent of the good or bad of either party. On neither side did he abuse, on neither did he laud or even justify. The side which he adopted seldom enjoyed approbation or even vindication, and only

¹ In the anonymous *Adventures of Giovanni de Lucca*.

in apology did he distinguish it from that to which he was inimical. From this peculiarity the opinions to which he leaned acquired strength from the suffrage of one so apparently impartial and unconcerned. Notwithstanding the prejudices generally attributed, however, to Hume as a historian, we cannot see him down as an enemy to liberty. No man had grander views of the power of the human mind, and of the higher majesty of intellect, when compared with the external attributes of rank; and the writings of a republican could not exceed in depicting this feeling the picture he has drawn of the parliament of Charles I., and of the striking circumstances of the king's condemnation. The instances in which he has shown himself to be inconsistent, may perhaps be more attributed to his habits than to his opinions. His indolent benevolence prompted a sympathy with the oppressed, and he felt a reluctance to justify those who assumed the aspect of active assailants, from whatever cause; while in matters of religion, viewing all persuasions in much the same aspect, unprejudiced himself, he felt a contempt for those who indulged in prejudice, and was more inclined to censure than to vindicate those who acted from religious impulse. With all his partialities, however, let those who study the character of the author while they read his history recollect, that he never made literature bow to rank, that he never flattered a great man to obtain a favour, and that, though long poor, he was always independent. Of the seeming contradiction between his life and opinions, we quote the following applicable remarks from the *Edinburgh Review*:

"Few things seem more unaccountable, and indeed absurd, than that Hume should have taken part with high church and high monarchy men. The persecutions which he suffered in his youth from the Presbyterians may, perhaps, have influenced his ecclesiastical partialities. But that he should have sided with the Tudors and the Stuarts against the people seems quite inconsistent with all the great traits of his character. His unrivalled sagacity must have looked with contempt on the preposterous arguments by which the *ius divinum* was maintained. His natural benevolence must have suggested the cruelty of subjecting the enjoyments of thousands to the caprice of one unfeeling individual: and his own practical independence in private life might have taught him the value of those feelings which he has so mischievously derided. Mr. Fox seems to have been struck with some surprise at this strange trait in the character of our philosopher. In a letter to Mr. Laing he says, 'He was an excellent man, and of great powers of mind; but his partiality to kings and princes is intolerable. Nay, it is, in my opinion, quite ridiculous: and is more like the foolish admiration which women and children sometimes have for kings, than the opinion, right or wrong, of a philosopher.'"

It would be a vain task to enumerate the controversial attacks on Hume's *History of England*. Dr. Hurd in his *Dialogues on the English Constitution* stoutly combated his opinions. Miller brought the force of his strongly thinking mind to a consideration of the subject at great length, but he assumed too much the aspect of a special pleader. Dr. Birch and Dr. Towers entered on minute examinations of particular portions of the narrative; and Major Cartwright, with more fancy than reason, almost caricatured the opinions of those who considered that Hume had designedly painted the government of the Tudors in arbitrary colours, to relieve that of the Stuarts. Mr. Laing appeared as the champion of the Scottish patriots, and Dr. M'Crie as the vindicator of the Presbyterians; and in our own day

two elaborate works have fully examined the statements and representations of Hume—the *British Empire* of Mr. Brodie, and the extremely impartial *Constitutional History* of Hallam.

In the interval betwixt the publication of the first and second volumes of the *History*, Hume produced the *Natural History of Religion*. This production is one of those which Warburton delighted to honour. In a pamphlet which Hume attributed to Hurd he thus politely notices it:—"The few excepted out of the whole race of mankind are, we see, our philosopher and his gang, with their pedlers' ware of matter and motion, who penetrate by their disquisitions into the secret structure of vegetable and animal bodies, to extract, like the naturalists in Gulliver, sunbeams out of cucumbers; just as wise a project as this of raising religion out of the intrigues of matter and motion. We see what the man would be at through all his disguises, and no doubt he would be much mortified if we did not; though the discovery we make is only this, that of all the slanders against revelation, this before us is the truest, the dirtiest, and the most worn in the drudgery of free-thinking, not but it may pass with his friends, and they have my free leave to make their best of it. What I quote it for is only to show the rancour of heart which possesses this unhappy man, and which could induce him to employ an insinuation against the Christian and the Jewish religions not only of no weight in itself, but of none, I will venture to say, even in his own opinion."¹ Hume says he "found by Warburton's railing" that his "books were beginning to be esteemed in good company;" and of the particular attention which the prelate bestowed on the sceptic, such specimens as the following are to be found in the correspondence of the former: "I am strongly tempted too to have a stroke at Hume in parting. He is the author of a little book called *Philosophical Essays*: in one of which he argues against the hope of a God, and in another (very needlessly, you will say) against the possibility of miracles. He has crowned the liberty of the press, and yet he has a considerable post under government. I have a great mind to do justice on his arguments against miracles, which I think might be done in few words. But does he deserve notice? Is he known among you? Pray answer me these questions; for if his own weight keeps him down, I should be sorry to contribute to his advancement to any place but the pillory."²

Of the very different manner in which he esteemed a calm and a scurrilous critic, we have happily been able to obtain an instance, in a copy of a curious letter of Hume, which, although the envelope is unfortunately lost, and the whole is somewhat mutilated, we can perceive from the circumstances to have been addressed to Dr. John Stewart, author of an *Essay on the Laws of Motion*. It affords a singular instance of the calm and forgiving spirit of the philosopher: "I am so great a lover of peace that I am resolved to drop this matter altogether, and not to insert a syllable in the preface which can have a reference to your essay. The truth is, I could take no revenge but such a one as would have been a great deal too cruel, and much exceeding the offence; for though most authors think that a contemptuous manner of treating their writings is but slightly revenged by hurting the personal character and the honour of their antagonists, I am very far from being of that opinion. Besides, as I am as certain as I can be of anything (and I am not such a sceptic as you may perhaps imagine), that your inserting such remarkable altera-

¹ Warburton's *Works*, vii. 851, 868.

² *Letters from a Late Rev. Prelate to One of his Friends*, 1808, p. 11.

tions in the printed copy proceeded entirely from precipitancy and passion, not from any formed intention of deceiving the society, I would not take advantage of such an incident to throw a slur on a man of merit whom I esteem, though I might have reason to complain of him. When I am abused by such a fellow as Warburton, whom I neither know nor care for, I can laugh at him. But if Dr. Stewart approaches any way towards the same style of writing, I own it vexes me; because I conclude that some unguarded circumstances of my conduct, though contrary to my intention, had given occasion to it. As to your situation with regard to Lord Kames, I am not so good a judge. I only know that you had so much the better of the argument that you ought upon that account to have been more reserved in your expressions. All railery ought to be avoided in philosophical argument, both because (it is) unphilosophical, and because it cannot but be offensive, let it be ever so gentle. What then must we think with regard to so many insinuations of irreligion to which Lord Kames' paper gave not the least occasion? This spirit of the inquisitor is, in you, the effect of passion, and what a cool moment would easily correct. But when it predominates in the character, what ravages has it committed on reason, virtue, truth, sobriety, and everything that is valuable among mankind!" We may at this period of his life consider Hume as having reached the age when the mind has entirely ceased to bend to circumstances, and cannot be made to alter its habits. Speaking of him in this advanced period of his life, an author signing himself G. N., and detailing some anecdotes of Hume, with whom he says he was acquainted, states (in the *Scots Magazine*) that "his great views of being singular, and a vanity to show himself superior to most people, led him to advance many axioms that were dissonant to the opinions of others, and led him into sceptical doctrines, only to show how minute and puzzling they were to other folk; in so far, that I have often seen him (in various companies, according as he saw some enthusiastic person there) combat either their religious or political principles; nay, after he had struck them dumb, take up the argument on their side, with equal good-humour, wit, and jocoseness, all to show his pre-eminence." The same person mentions his social feelings, and the natural disposition of his temper to flow with the current of whatever society he was in; and that while he never gambled he had a natural liking to whist-playing, and was so accomplished a player as to be the subject of a shameless proposal on the part of a needy man of rank, for bettering their mutual fortunes, which it need not be said was repelled. But Henry M'Kenzie, who has attempted to embody the character of the sceptic in the beautiful fiction of *La Roche*, has drawn, from his intimate knowledge of character, and his great acquaintance with the philosopher, a more pleasing picture. His words are: "The unfortunate nature of his opinions with regard to the theoretical principles of moral and religious truth never influenced his regard for men who held very opposite sentiments on those subjects, which he never, like some vain shallow sceptics, introduced into social discourse; on the contrary, when at any time the conversation tended that way, he was desirous rather of avoiding any serious discussion on matters which he wished to confine to the graver and less dangerous consideration of cool philosophy. He had, it might be said, in the language which the Grecian historian applies to an illustrious Roman, two minds; one which indulged in the metaphysical scepticism which his genius could invent, but which it could not always disentangle; another simple, natural, and playful,

which made his conversation delightful to his friends, and even frequently conciliated men whose principles of belief his philosophical doubts, if they had not power to shake, had grieved and offended. During the latter period of his life I was frequently in his company amidst persons of genuine piety, and I never heard him venture a remark at which such men, or ladies—still more susceptible than men—could take offence. His good nature and benevolence prevented such an injury to his hearers; it was unfortunate that he often forgot what injury some of his writings might do to his readers."¹

Hume was now a man of a very full habit, and somewhat given to indolence in all occupations but that of literature. An account of himself, in a letter to his relation Mrs. Dysart, may amuse from its calm pleasantry and good-humour: "My compliments to his solicitorship. Unfortunately I have not a horse at present to carry my fat carcass to pay its respects to his superior obesity. But if he finds travelling requisite either for his health or the captain's, we shall be glad to entertain him here as long as we can do it at another's expense, in hopes that we shall soon be able to do it at our own. Pray, tell the solicitor that I have been reading lately, in an old author called Strabo, that in some cities of ancient Gaul there was a fixed legal standard established for corpulency, and that the senate kept a measure, beyond which, if any belly presumed to increase, the proprietor of that belly was obliged to pay a fine to the public, proportionable to its rotundity. Ill would it fare with his worship and I (me), if such a law should pass our parliament, for I am afraid we are already got beyond the statute. I wonder indeed no harpy of the treasury has ever thought of this method of raising money. Taxes on luxury are always most approved of, and no one will say that the carrying about a portly belly is of any use or necessity. 'Tis a mere superfluous ornament, and is a proof too that its proprietor enjoys greater plenty than he puts to a good use; and, therefore, 'tis fit to reduce him to a level with his fellow-subjects by taxes and impositions. As the lean people are the most active, unquiet, and ambitious, they everywhere govern the world, and may certainly oppress their antagonists whenever they please. Heaven forbid that Whig and Tory should ever be abolished, for then the nation might be split into fat and lean, and our faction, I am afraid, would be in a piteous taking. The only comfort is, if they oppress us very much we should at last change sides with them. Besides, who knows if a tax were imposed on fatness, but some jealous divine might pretend that the church was in danger. I cannot but bless the memory of Julius Cæsar for the great esteem he expressed for fat men, and his aversion to lean ones. All the world allows that the emperor was the greatest genius that ever was, and the greatest judge of mankind."

In the year 1756, the philosophical calm of Hume appeared in danger of being disturbed by the fulminations of the church. The outcry against his doubting philosophy became loud, scepticism began to be looked on as synonymous with infidelity, and some of the fiercer spirits endeavoured to urge on the church to invade the sacred precincts of freedom of opinion. The discussion of the subject commenced before the committee of overtures on the 27th of May, and a long debate ensued, in which some were pleased to maintain that Hume, not being a Christian, was not a fit person to be judged by the venerable court. For a more full narrative of those proceedings we refer to the life of HENRY HOME of Kames, who

¹ Mackenzie's *Life of Hume*, p. 29.

was subjected to the same attempt at persecution. In an analysis of the works of the two authors, published during the session of the assembly, and circulated among the members, the writer laid down the following as propositions which he would be enabled to prove were the avowed opinions of Mr. Hume:—“1st, All distinction between virtue and vice is merely imaginary—2d, Justice has no foundation further than it contributes to public advantage—3d, Adultery is very lawful, but sometimes not expedient—4th, Religion and its ministers are prejudicial to mankind, and will always be found either to run into the heights of superstition or enthusiasm—5th, Christianity has no evidence of its being a divine revelation—6th, Of all the modes of Christianity, Popery is the best, and the reformation from thence was only the work of madmen and enthusiasts.” The overture was rejected by the committee, and the indefatigable vindicators of religion brought the matter under a different shape before the presbytery of Edinburgh, but that body very properly decided on several grounds, among which, not the least applicable was, “to prevent their entering further into so abstruse and metaphysical a subject,” that it “would be more for the purposes of edification to dismiss the process.”

In 1759 appeared Dr. Robertson's *History of Scotland*, and the similarity of the subjects in which he and Hume were engaged produced an interchange of information, and a lasting friendship, honourable to both these great men. Hume was singularly destitute of literary jealousy; and of the unaffected welcome which he gave to a work treading on his own peculiar path, we could give many instances did our limits permit. He never withheld a helping hand to any author who might be considered his rival, and, excepting in one instance, never peevishly mentioned a living literary author in his works. The instance we allude to is a remark on Mr. Tytler's vindication of Queen Mary, and referring the reader to a copy of it below,¹ it is right to remark, that it seems more dictated by contempt of the arguments, than spleen towards the person of the author.

Any account of the literary society in which Hume spent his hours of leisure and conviviality would involve us in a complete literary history of Scotland during that period, unsuitable to a biographical dictionary. With all the eminent men of that illustrious period of Scottish literature he was intimately acquainted; as a philosopher, and as a man of dignified and respected intellect, he stood at the head of the list of great names; but in the less calm employments in which literary men of all periods occupy themselves, he was somewhat shunned, as a person too lukewarm, indolent, and good-humoured, to support literary warfare. An amusing specimen of his character in this respect is mentioned by M'Kenzie in his life of Home. When two numbers of a periodical work, entitled the *Edinburgh Review*, were published in 1755, the bosom friends of Hume, who were the

conductors, concealed it from him, because, “I have heard,” says M'Kenzie, “that they were afraid both of his extreme good nature, and his extreme artlessness; that, from the one, their criticisms would have been weakened or suppressed, and, from the other, their secret discovered;” and it was not till Hume had repeated his astonishment that persons in Scotland beyond the sphere of the literary circle of Edinburgh could have produced so able a work, that he was made acquainted with the secret. In whimsical revenge of the want of confidence displayed by his friends, Hume gravely maintained himself to be the author of a humorous work of Adam Ferguson, *The History of Sister Peg*, and penned a letter to the publisher, which any person who might peruse it without knowing the circumstances could not fail to consider a sincere acknowledgment. Hume was a member of the Philosophical Society, which afterwards merged into the Royal Society of Edinburgh, and acted as joint secretary along with Dr. Monro, junr. He was also a member of the illustrious Poker Club, and not an uncongenial one, so long as the members held their unobtrusive discussion in a tavern, over a small quantity of claret; but when this method of managing matters was abolished, and the institution merged into the more consequential denomination of “The Select Society,” amidst the exertions of many eloquent and distinguished men, he was only remarkable, along with his friend Adam Smith, for having never opened his mouth.

In 1761 Mr. Hume published the two remaining volumes of the *History of England*, treating of the period previous to the accession of the house of Tudor. He tells us that it was received with “tolerable, and but tolerable success.” Whitaker, Hallam, Turner, and others, have examined their respective portions of this period of history with care, and pointed out the inaccuracies of Hume; but the subject did not possess so much political interest as the later periods, and general readers have not been much disposed to discuss the question of his general accuracy. Men such as the first name we have mentioned have attacked him with peevishness on local and obscure matters of antiquarian research, which a historian can hardly be blamed for neglecting; others, however, who seem well informed, have found serious objections to his accuracy. In an article on the “Saxon Chronicle,” which appeared in the *Retrospective Review*, by an apparently well-informed writer, he is charged in these terms: “It would be perfectly startling to popular credulity should all the instances be quoted in which the text of Hume, in the remoter periods more especially, is at the most positive variance with the authorities he pretends to rest upon. In a series of historical inquiries which the writer of this article had some years since particular occasion to superintend, aberrations of this kind were so frequently detected, that it became necessary to lay it down as a rule never to admit a quotation from that popular historian when the authorities he pretends to refer to were not accessible for the purpose of previous comparison and confirmation.”

Hume, now pretty far advanced in life, had formed the resolution of ending his days in literary retirement in his own country, when, in 1763, he was solicited by the Earl of Hertford to attend him on his embassy to Paris, and after having declined, on a second invitation he accepted the situation. In the full blaze of a wide-spread reputation the philosopher was now surrounded by a new world of literary rivals, imitators, and admirers, and he received from a circle of society ever searching for what was new, brilliant, and striking, numberless marks of distinction, highly flattering to his literary pride, though not un-

¹ But there is a person that has written an *Inquiry*, historical and critical, into the evidence against Mary Queen of Scots; and has attempted to refute the foregoing narrative. He quotes a single passage of the narrative, in which Mary is said simply to refuse answering; and then a single passage from Goodall, in which she boasts simply that she will answer; and he very civilly, and almost directly, calls the author a liar, on account of this pretended contradiction. That whole *Inquiry*, from beginning to end, is composed of such scandalous articles; and from this instance the reader may judge of the candour, fair dealing, veracity, and good manners of the inquirer. There are, indeed, three events in our history which may be regarded as touchstones of party-men. An English Whig, who asserts the reality of the Popish Plot—an Irish Catholic, who denies the massacre in 1641—and a Scottish Jacobite, who maintains the innocence of Queen Mary—must be considered as men beyond the reach of argument or reason; and must be left to their prejudices.”

mixed with affectation. In some very amusing letters to his friends written during this period he shows that if he was weak enough to feel vain of these distinctions, he had sincerity enough to say so.

The fashionable people of Paris, and especially the ladies, practised on the patient and good-humoured philosopher every torture which their extreme desire to render him and themselves distinguished could dictate. "From what has been already said of him," says Lord Charlemont, "it is apparent that his conversation to strangers, and particularly to Frenchmen, could be little delightful, and still more particularly one would suppose to French women; and yet no lady's toilette was complete without Hume's attendance. At the opera his broad unmeaning face was usually seen *entre deux jolis minois*. The ladies in France gave the ton, and the ton was deism." Madame D'Epinay, who terms him "Grand et gros historiographe d'Angleterre," mentions that it was the will of one of his entertainers that he should act the part of a sultan, endeavouring to secure by his eloquence the affection of two beautiful female slaves. The philosopher was accordingly whiskered, turbaned, and blackened, and placed on a sofa betwixt two of the most celebrated beauties of Paris. According to the instructions he had received, he bent his knees, and struck his breast (or, as madame has it, "le ventre"), but his tongue could not be brought to assist his actions further than by uttering "Eh bien! mes demoiselles—Eh bien! vous voilà donc—Eh bien! vous voilà—vous voilà ici?" exclamations which he repeated until he had exhausted the patience of those he was expected to entertain.¹

In 1765, Lord Hertford being appointed lord-lieutenant of Ireland, Mr. Hume, according to his expectation, was appointed secretary to the embassy, and he officiated as chargé d'affaires until the arrival of the Duke of Richmond. Hume, who had a singular antipathy to England, and who had previously enjoyed himself only in the midst of his social literary circle at Edinburgh, insensibly acquired a relish for the good-humoured politeness and the gaiety of the French; and on his return home in 1766 he left behind him a number of regretted friends, among whom were two celebrated females, the Marchioness De Barbantane and the Countess De Boufflers, who conducted a friendly, and even extremely intimate, correspondence with the philosopher to the day of his death.²

In the order of time we come now to the discussion of an incident connected with his residence on the Continent which forms a very remarkable epoch in the life of Hume—we mean his controversy with Rousseau. Before making any statements, however, it is right to warn our readers that an account of this memorable transaction, sufficient to give him an acquaintance with all its peculiarities, would exceed our limits, which permit of but a slight glance at the incidents, and that indeed it is quite impossible to form a conception of the grotesqueness of some of the incidents, and the peculiarities of character so vividly displayed, without a perusal of the original documents, which are easily accessible, and will well repay the trouble of perusal.

When in 1762 the parliament of Paris issued an *arrêt* against Rousseau on account of his opinions, Hume was applied to by a friend in Paris to discover for him a retreat in England. Hume willingly undertook a task so congenial, but it did not suit the celebrated exile at that time to avail himself of his offer. Rousseau, taking every opportunity to complain of

the misfortunes he suffered, the transaction with Hume was again set on foot at the instigation of the Marchioness De Verdin. Hume wrote to Rousseau, offering his services, and the latter returned him an answer overflowing with extravagant gratitude. Rousseau had, it appeared, discovered an ingenious method of making himself interesting: he pretended extreme poverty, and had offers of assistance repeatedly made him, which he publicly and disdainfully refused, while he had in reality, as Hume afterwards discovered, resources sufficient to provide for his support. In pure simplicity Hume formed several designs for imposing on Rousseau's ignorance of the world, and establishing him comfortably in life, without allowing him to know that he was assisted by others; and the plan finally concluded and acted on was, that he should be comfortably boarded in the mansion of Mr. Davenport, at Wooton, in the county of Derby—a gentleman who kindly undertook to lull the suspicions of the irritable philosopher by accepting of a remuneration amounting to £30 a year. Rousseau arrived in London, and appearing in public in his Armenian dress, excited much notice, both from the public in general, and from literary men. Hume, by his interest with the government, obtained for him a pension of £100 a year, which it suited those in authority to wish should be kept secret. Rousseau expressed much satisfaction at this condition, but he afterwards declined the grant, hinting at the secrecy as an impediment to his acceptance of it; his zealous friend procured the removal of this impediment, and the pension was again offered, but its publicity afforded a far more gratifying opportunity of refusal. Immediately after he had retired to Wooton with his housekeeper and his dog, nothing occurred apparently to infringe his amicable intercourse with Hume; but that individual was little aware of the storm in preparation. The foreign philosopher began to discover the interest of his first appearance in Britain subsiding. He was not in a place where he could be followed by crowds of wondering admirers; the press was lukewarm and regardless, and sometimes ventured to bestow on him a sneer; and above all, no one sought to persecute him. The feelings which these unpleasant circumstances occasioned appear to have been roused to sudden action by a sarcastic letter in the name of the King of Prussia, of which Rousseau presumed D'Alembert to have been the author, but which was claimed by Horace Walpole, and which made the circle of the European journals; and by an anonymous critique of a somewhat slighting nature, which had issued from a British magazine, but which appears not to have been remarked or much known at the period. Of these two productions it pleased Rousseau to presume David Hume the instigator, and he immediately framed in his mind the idea of a black project laid for his ruin, countenanced and devised by his benefactor under the mask of friendship. Rousseau then wrote a fierce letter to Hume, charging him in somewhat vague terms with a number of horrible designs, and in the general manner of those who bring accusations of unutterable things, referring him to his own guilty breast for a more full explanation. Hume naturally requested a farther explanation of the meaning of this ominous epistle, and he received in answer a narrative which occupies forty printed pages. It were vain to enumerate the subjects of complaint in this celebrated document. There was an accusation of terrible affectation on the part of Hume in getting a portrait of the unfortunate exile engraved; he had insulted him by procuring dinners to be sent to his lodgings in London (a circumstance which Hume accounted for on the ground

¹ *Mémoires et Correspondance de Madame D'Epinay*, iii. 284.

² *General Correspondence of David Hume*, 410, 1826. *passim*.

of there having been no convenient chop-house in the neighbourhood). He had also flattered him (an attention which Hume maintains was not unacceptable at the period) with a deep-laid malignity. Hume had also formed a plan of opening all his letters and examining his correspondence (an accusation which Hume denied). Hume was intimate with the son of an individual who entertained towards Rousseau a mortal hatred. A narrative of the treatment which Rousseau had met with at Neuchâtel, and which he wished to have published in England, was delayed at the press; but we shall give in Rousseau's own words (as translated) the most deadly article of the charge, premising that the circumstances were occasioned by Hume's having attempted to impose on him a coach hired and paid for as a retour vehicle:—"As we were sitting one evening, after supper, silently by the fire-side, I caught his eye intently fixed on mine, as indeed happened very often: and that in a manner of which it is very difficult to give an idea. At that time he gave me a steadfast, piercing look, mixed with a sneer, which greatly disturbed me. To get rid of the embarrassment I lay under, I endeavoured to look full at him in my turn; but in fixing my eyes against his I felt the most inexpressible terror, and was obliged soon to turn them away. The speech and physiognomy of the good David is that of an honest man; but where, great God! did this good man borrow those eyes he fixes so sternly and unaccountably on those of his friends? The impression of this look remained with me and gave me much uneasiness. My trouble increased even to a degree of fainting; and if I had not been relieved by an effusion of tears I had been suffocated. Presently after this I was seized with the most violent remorse; I even despised myself; till at length in a transport, which I still remember with delight, I sprang on his neck, embraced him eagerly, while almost choked with sobbing, and bathed in tears, I cried out in broken accents, No, no, David Hume cannot be treacherous. If he be not the best of men, he must be the basest of mankind. David Hume politely returned my embraces, and, gently tapping me on the back, repeated several times, in a good-natured and easy tone, Why, what, my dear sir! nay, my dear sir! Oh, my dear sir! He said nothing more. I felt my heart yearn within me. We went to bed; and I set out the next day for the country."

The charge terminates with accusing Hume of wilful blindness, in not being aware, from the neglect with which Rousseau treated him, that the blackness of his heart had been discovered. Soon after the controversy was terminated, a ludicrous account of its amusing circumstances was given to the public; the extreme wit and humorous pungency of which will excuse our insertion of it, while we may also mention, that with its air of railery it gives an extremely correct abstract of the charge of Rousseau. It is worthy of remark, that the terms made use of show the author to have been colloquially acquainted with the technicalities of *Scottish law*, although it is not likely that a professional person would have introduced terms applicable only to civil transactions into the model of a criminal indictment. We have found this production in the *Scots Magazine*. Mr. Ritchie says it appeared in the *St. James's Chronicle*: in which it may have been first published.

HEADS OF AN INDICTMENT LAID BY J. J. ROUSSEAU,
PHILOSOPHER, AGAINST D. HUME, ESQ.

1. That the said David Hume, to the great scandal of philosophy, and not having the fitness of things before his eyes, did concert a plan with Messrs.

Froachin, Voltaire, and D'Alembert, to ruin the said J. J. Rousseau for ever by bringing him over to England, and there settling him to his heart's content.

2. That the said David Hume did, with a malicious and traitorous intent, procure, or cause to be procured, by himself or somebody else, one pension of the yearly value of £100, or thereabouts, to be paid to the said J. J. Rousseau, on account of his being a philosopher, either privately or publicly, as to him, the said J. J. Rousseau, should seem meet.

3. That the said David Hume did, one night after he left Paris, put the said J. J. Rousseau in bodily fear by talking in his sleep; although the said J. J. Rousseau doth not know whether the said David Hume was really asleep, or whether he shammed Abraham, or what he meant.

4. That, at another time, as the said David Hume and the said J. J. Rousseau were sitting opposite each other by the fireside in London, he, the said David Hume, did look at him, the said J. J. Rousseau, in a manner of which it is difficult to give any idea; that he, the said J. J. Rousseau, to get rid of the embarrassment he was under, endeavoured to look full at him, the said David Hume, in return, to try if he could not stare him out of countenance; but in fixing his eyes against his, the said David Hume's, he felt the most inexpressible terror, and was obliged to turn them away, inasmuch that the said J. J. Rousseau doth in his heart think and believe, as much as he believes anything, that he the said David Hume is a certain composition of a white-witch and a rattlesnake.

5. That the said David Hume on the same evening, after politely returning the embraces of him, the said J. J. Rousseau, and gently tapping him on the back, did repeat several times in a good-natured easy tone, the words, "Why, what, my dear sir! Nay, my dear sir! Oh, my dear sir!"—From whence the said J. J. Rousseau doth conclude, as he thinks upon solid and sufficient grounds, that he the said David Hume is a traitor; albeit he, the said J. J. Rousseau, doth acknowledge that the physiognomy of the good David is that of an honest man, all but those terrible eyes of his, which he must have borrowed; but he, the said J. J. Rousseau, vows to God he cannot conceive from whom or what.

6. That the said David Hume hath more inquisitiveness about him than becometh a philosopher, and did never let slip an opportunity of being alone with the governante of him, the said J. J. Rousseau.

7. That the said David Hume did most atrociously and flagitiously put him, the said J. J. Rousseau, philosopher, into a passion; as knowing that then he would be guilty of a number of absurdities.

8. That the said David Hume must have published Mr. Walpole's letter in the newspapers, because, at that time, there was neither man, woman, nor child in the island of Great Britain, but the said David Hume, the said J. J. Rousseau, and the printers of the several newspapers aforesaid.

9. That somebody in a certain magazine, and somebody else in a certain newspaper, said something against him, the said John James Rousseau, which he, the said J. J. Rousseau, is persuaded, for the reason above mentioned, could be nobody but the said David Hume.

10. That the said J. J. Rousseau knows that he, the said David Hume, did open and peruse the letters of him, the said J. J. Rousseau, because he one day saw the said David Hume go out of the room after his own servant, who had at that time a letter of the said J. J. Rousseau's in his hands; which must have been in order to take it from the servant, open it, and read the contents.

11. That the said David Hume did, at the instigation of the devil, in a most wicked and unnatural manner, send, or cause to be sent, to the lodgings of him, the said J. J. Rousseau, one dish of beef-steaks, thereby meaning to insinuate that he, the said J. J. Rousseau, was a beggar, and came over to England to ask alms; whereas, be it known to all men by these presents, that he, the said John James Rousseau, brought with him the means of sustenance, and did not come with an empty purse; as he doubts not but he can live upon his labours with the assistance of his friends; and in short can do better without the said David Hume than with him.

12. That besides all these facts put together, the said J. J. Rousseau did not like a certain appearance of things on the whole.

Rousseau, with his accustomed activity on such occasions, loudly repeated his complaints to the world, and filled the ears of his friends with the villany of his seeming benefactor. The method which Hume felt himself compelled to adopt for his own justification was one which proved a severe punishment to his opponent; he published the correspondence, with a few explanatory observations, and was ever afterwards silent on the subject. Some have thought that he ought to have remained silent from the commencement, and that such was his wish we have ample proof from his correspondence at that period, but to have continued so in the face of the declarations of his enemy, he must have been more than human; and the danger which his fame incurred from the acts of a man who had the means of making what he said respected will at least *justify* him.

Hume had returned to Edinburgh with the renewed intention of there spending his days in retirement, and in the affluence which his frugality, perseverance, genius, and good conduct had acquired for him; but in 1765, at the solicitation of General Conway, he acted for that gentleman as an under-secretary of state. It is probable that he did not make a better under-secretary than most men of equally diligent habits might have done, and nothing occurs worthy of notice during his tenure of that office, which he resigned in January, 1768, when General Conway resigned his secretaryship.

We have nothing to record from this period till we come to the closing scene of the philosopher's life. In the spring of 1775 he was struck with a disorder of the bowels, which he soon became aware brought with it the sure prognostication of a speedy end. "I now," he says, "reckon upon a speedy dissolution. I have suffered very little pain from my disorder; and what is more strange, have, notwithstanding the great decline of my person, never suffered a moment's abatement of my spirits, inasmuch, that were I to name the period of my life which I should most choose to pass over again, I might be tempted to point to this latter period. I possess the same ardour as ever in study, and the same gaiety in company. I consider, besides, that a man of sixty-five, by dying, cuts off only a few years of infirmities, and though I see many symptoms of my literary reputation breaking out at last with additional lustre, I know that I could have but few years to enjoy it. It is difficult to be more detached from life than I am at present."

The entreaties of his friends prevailed on Hume to make a last effort to regain his health by drinking the Bath waters, and he left Edinburgh for that purpose in the month of April, after having prepared his will and written the memoir of himself so often referred to. The journey had the effect of partly

alleviating Mr. Hume's disorder, but it returned with renewed virulence. While his strength permitted such an attempt, he called a meeting of his literary friends to partake with him of a farewell dinner. The invitation sent to Dr. Blair is extant, and is in these terms: "Mr. John Hume, *alias* Home, *alias* the late lord-conservator, *alias* the late minister of the gospel at Athelstaneford, has calculated matters so as to arrive infallibly with his friend in St. David Street on Wednesday evening. He has asked several of Dr. Blair's friends to dine with him there on Thursday, being the 4th of July, and begs the favour of the doctor to make one of the number." Subjoined to the card there is this note in Dr. Blair's handwriting: "*Mem.* This the last note received from David Hume. He died on the 25th of August, 1776." This mournful festival, in honour as it were of the departure of the most esteemed and illustrious member of their brilliant circle, was attended by Lord Elibank, Adam Smith, Dr. Blair, Dr. Black, Professor Ferguson, and John Home. On Sunday, the 25th August, 1776, Mr. Hume expired. Of the manner of his death, after the beautiful picture which has been drawn of the event by his friend Adam Smith, we need not enlarge. The calmness of his last moments, unexpected by many, was in every one's mouth at the period, and it is still well known. He was buried on a point of rock overhanging the old town of Edinburgh, now surrounded by buildings, but then bare and wild—the spot he had himself chosen for the purpose. A conflict betwixt a vague horror at his imputed opinions, and respect for the individual who had passed among them a life so irreproachable, created a sensation among the populace of Edinburgh, and a crowd of people attended the body to its grave, which for some time was an object of curiosity. According to his request Hume's *Dialogues on Natural Religion* were published after his death, a beautifully classic piece of composition, bringing us back to the days of Cicero. It treats of many of the speculations propounded in his other works.

HUME, JOSEPH, M.P. This distinguished member of parliament and political reformer was one of the many Scotsmen who, without the advantages of birth, rank, inheritance, or social influence, raised himself to place and political eminence, and won for himself a high name among the chief men of the age. He was born at Montrose, in January, 1777. His father, who was master of a small coasting vessel trading from that town, died, leaving his widow and a numerous family, of whom Joseph was a younger son, in very narrow circumstances. But this circumstance only roused the mother's heart to double exertion: she opened a small crockery shop (some allow it was only a stall) in the town of Montrose, and from the profits of her humble trade supported her children. The education of Joseph was owing to a curious circumstance. The Honourable William Maule, father of the present Earl of Dalhousie, professed himself a believer in animal magnetism, or mesmerism, at that time a new and wonderful science, and to convince his incredulous companions who were assembled with him at the inn of Montrose, he engaged at that distance so powerfully to magnetize the old lady that she would break her whole stock of crockery. He accordingly commenced his conjurations in the wonted form—and to the astonishment as well as awe of the young unbelievers, Mrs. Hume commenced the work of destruction until every cup and pitcher was shivered into potsherds. It is unnecessary of course to add that the whole affair was preconcerted, and that she acted according

to his instructions. When Mr. Maule had liberally repaid her for the damage, he added, "and now, my good woman, is there anything else I can do for you?" She replied, "She had a son, a sharp little fellow, whom she wished to receive a better education than she could give him." She alluded to Joseph, the future smasher of abuses and superfluities in the House of Commons. Mr. Maule saw the boy, was well pleased with him, and sent him to school, and afterwards assisted him at college. His provident mother, who afterwards traded in coals, was of such an industrious independent spirit, that after providing for her family she continued her occupation to the last, and refused every offer of her son to place her in a better position. In such a resolute disinterested spirit who can fail to recognize the character which was inherited by the member for Montrose and Middlesex?

The education which Joseph Hume received in the schools of Montrose was more practical and useful than ample, consisting of reading, writing and arithmetic, and a little Latin. At the age of thirteen he was apprenticed to a surgeon in his native town, with whom he remained three years, chiefly employed in compounding prescriptions, and in 1793 he attended the medical classes of the college of Edinburgh. In 1796 he was admitted a member of the College of Surgeons, after which he repaired to London, "walked the hospitals," and through the influence of the late Mr. Daniel Scott, M.P. for Forfar, and Maule of Panmure, he was entered assistant-surgeon in the marine service of the East India Company. In 1797, and the following year, he made his first voyage to India and then home, which occupied eighteen months. In his second voyage to India, in one of those wretched arks which the Company employed, and which was filled, or rather crammed, with all kinds of passengers, high and low, delicate and desperate, that most important functionary, the purser, accidentally died. In this dilemma Joseph Hume volunteered to supply his place, and discharged the duties of the office in addition to his own as surgeon so effectually as to secure the goodwill of all on board. In consequence of this, when the ship arrived in Calcutta, he received a grateful testimonial from all on board—officers, crew, and passengers—for his gratuitous services, through which he landed with the best of recommendations, and was enabled to commence the business of life with every prospect of success.

On landing in India for his professional duties, the quick eye and practical sense of the young Scotch surgeon detected a grievous error in the Anglo-Indian government. Although the Company was the ruling power, and held its dominion by a precarious tenure, few of its officials were acquainted with the language of the people. It was the same unpardonable negligence which at a later day allowed the Indian mutiny to ripen undetected, until it burst forth into action, and nearly occasioned the loss of our empire in India. Mr. Hume forthwith set himself to learn the Indian languages, and especially the Persian, the court language of India; and to these difficult studies, which he mastered with rapidity and ease, he added a knowledge of the religions of the country through all their multiplied sects and superstitions. Nor was the fit reward of all these studies long delayed. In 1802-3, when Lord Lake's *Mahratta* war was about to break out, it was discovered with dismay that the gunpowder in store was useless from damp. This carelessness, by which the whole campaign would have been arrested, was happily remedied by Hume's knowledge of chemistry: he offered to restore the gunpowder to its former state

of efficiency, and completely succeeded. The attention of government was now fixed upon him as a most able and useful servant, and too much could not be done for one who had relieved them in such a difficulty. In the campaign his knowledge of the Eastern tongues was equally available. Being attached to a regiment in his medical capacity, the commander-in-chief was in need of an interpreter to negotiate with the hostile powers, and none in the army was found so capable of the office as Joseph Hume. His services in this department led to employment in others, so that he was not only army surgeon and interpreter, but was also paymaster and postmaster of the forces, in the prize agencies, and the commissariat. Each office, in itself sufficient for one man, he discharged either collectively or successively, with an ability that never blundered and an energy that never was weary. The effect of this wonderful power of application was exemplified near the close of his life, when he was an active and most efficient member of a select committee of the House of Commons on the military, ordnance, and commissariat expenditure. On this occasion, when Mr. Hume's colleagues were astounded at his minute and intelligent examination of witnesses, and could not help expressing their astonishment, he observed, "You forget I was once commissary-general to an army of 12,000 men in India." For such an amount and variety of labour Mr. Hume was so fortunate as to be adequately rewarded; and when after five years this Indian war terminated, he had realized a fortune of thirty or forty thousand pounds. And yet though rapidly, it had been honestly and worthily, won. He had as yet only passed his thirtieth year, and by ten or twenty more years of similar industry he might have retired from India with the fortune of a millionaire, and the prospect of continued years to enjoy it. But content with what he had already won, and which was more than sufficient for his simple wants, he retired from his profession in the service of the East India Company, and returned to England. It is probable that having tried his strength, and ascertained what he might accomplish, he already contemplated that public career at home for which his Indian training was a hopeful commencement.

On returning to England in 1808, and enjoying a short period of rest, Mr. Hume started afresh for the new career that lay before him. In acquiring the knowledge of European politics he resolved to examine and judge for himself, and in 1809 he visited nearly every populous town in the United Kingdom, examining the condition of their inhabitants, and the state of their ports, commerce, and manufactures. Having made this exploration of England, Scotland, and Ireland, he devoted the years 1810 and 1811 to foreign travel, and applied a similar inquest to the Continent, Spain, Portugal, Sicily, Malta, Sardinia, Greece, the Ionian Isles, Turkey, Egypt, &c. As yet his political opinions, so far as party was concerned, leaned to the Tory side: among its members his earlier associations had been formed, and his first political convictions adopted, while his life of constant occupation in India had afforded little opportunity for further inquiry. To men so situated the orthodoxy of their political creed is but a matter of secondary consideration, and so it was with Joseph Hume. On returning from his foreign tour, his first aim was to obtain a seat in the House of Commons; and in this he was soon successful. Sir John Lowther Johnston, patron of the borough of Weymouth, and also its representative in the commons, having died, a Scotch solicitor of the deceased baronet introduced Mr. Hume to the constituents for a valuable consideration, and the latter succeeded to the vacant

seat in January, 1812. In this manner the future Radical came into parliament as a Tory, and at his entrance took his seat on the treasury bench, and supported the Perceval administration. As this was the last session of parliament, his bargain had included his re-election, and on the dissolution in the following autumn he naturally expected to be returned anew. But a difficulty had already occurred sufficient to prevent his re-election. On becoming a member of parliament, his radical and reforming tendencies had begun to break out like an instinct. He had been wont, in periodically visiting his constituents, to give them an account of his stewardship, and this the tranquil borough regarded as a work of supererogation. He had also advocated schools and other social benefits, a proceeding that savoured of Radicalism. There were suspicious tendencies which the Duke of Cumberland and his associate trustees could not away with, and Mr. Hume was not re-appointed to represent Weymouth and Melcombe Regis. An arbitration followed, by the verdict of which he was paid an equivalent in money for breach of contract; but this instance of the corruptions of the borough system seems to have convinced Mr. Hume of the existing abuses in our government, and the necessity of reforming them. The die was cast, and he would be a Tory no longer.

During the six years that Mr. Hume ceased to have a seat in the House of Commons his mind was not idle, and we find him constantly employed, chiefly in those pursuits that qualified him for readmission to parliament. He was an active member of the central committee of the Lancastrian school system. He formed an acquaintanceship with Francis Place, John Mill, Sir John Bowring, and other leading members of the Bentham school of political reformers, whose ideas he afterwards turned to practical account in the moral and intellectual interests of the working classes, and in the improvement of their physical condition. He published a pamphlet advocating the establishment of savings-banks, and explanatory of the principles on which they were subsequently founded. But of all Mr. Hume's aspirations, next to a seat in the House of Commons, was that of a directorship in the East India Company, as no one had studied more closely the nature and necessities of our Indian government. But these qualifications were such as many of the electors did not value, and not a few were interested in excluding. His repeated applications were therefore unsuccessful, and these rejections only made him more earnest in exposing the abuses of our Indian government at every meeting of the proprietors. It happened however with him, as with a few of the choice favourites of fortune, that while seeking what he could not obtain, he unexpectedly got something better in its room. The late Mr. Burnley of Guildford Street had four votes, and great influence at the India House, but a rooted dislike to all canvassing for directorships. This Mr. Hume knew; but knowing also that truth is great and must in the end prevail, he obtained access to this gentleman, and besought his interest, representing the greatness of Indian abuses, the efficacy of his remedy, and the advantages that would accrue to the holders of India stock, were he admitted to the directorship. His earnestness, his knowledge of the subject, and the lucid manner in which he explained it, moved the worthy gentleman, and what was of still more account, his daughter also, so that although the canvasser did not become a director of the East India Company, he became Miss Burnley's husband—a union by which his fortune, and better still, his happiness, was more than doubled.

Having remained unseated for six long years, but which were not years of idleness, Mr. Hume at last re-entered parliament, which met on the 14th January, 1819. His political principles were matured, his deeds had announced them both to friend and enemy, and there was no danger that he would take his seat as a neutral or as a doubtful partisan. He entered as representative of the Aberdeen district of burghs, which comprised his native town of Montrose, with Brechin, Inverberrie, and Aberbrothock. The election also was suited to the man and the political doctrines he held, for it was made through the influence of the liberal party of the north of Scotland, with his early patron Lord Panmure at their head, after a hard fight with the borough-mongers, who wished to return a man of their own stamp. In 1830 Mr. Hume gave up his seat for Montrose, being returned unopposed for Middlesex, having for his colleague Mr. Byng, the late "father of the House of Commons." For Middlesex he continued to sit until the dissolution of parliament in 1837, when in July Colonel Wood defeated him by a small majority. In the same month, however, he was returned through the influence of Mr. Daniel O'Connell for Kilkenny. In 1841 he contested for Leeds, and there also was unsuccessful. But in 1842, on the retirement of Mr. Chalmers from Montrose, Mr. Hume succeeded him, and continued to represent his native town until the close of his life. Such a long political career, and one of such incessant action, however, it would be impossible to detail or even to epitomize within ordinary limits. "How," exclaims an eloquent writer in the *Times* newspaper, "are we to characterize or even note the herculean labours of this prodigy in representative government? It is impossible, within the limits of volumes, to record his innumerable speeches in parliament, his motions, his returns, his select committees, his reports, his personal and party contests in the House of Commons, much less his various agitations 'out of doors.' His speeches alone, during thirty-seven years, occupy volumes of Hansard. In some, Mr. Hume's speeches occur in 150 pages, on various political and legislative questions."

Continuing the theme, the writer contents himself with the following very brief summary: "We cannot attempt even an analysis of the chief subjects of his active and busy discussion. He is the modern Prynne, who defies all reprint, comment, or review. In this age of levelling legislation on social interests, he was always 'on his legs.' He spoke oftener, and frequently made longer speeches, than any other member of the commons since England enjoyed a House of Commons. In the court of directors and in parliament he stood for many years almost alone contending for the freedom of trade against the East India monopoly. He proposed sweeping and repeated plans of reform of the army, navy, and ordinance, and of almost every civil department, of the established churches and ecclesiastical courts, of the civil and criminal laws, of the system of public accounts, of general taxation, duties, and customs. He early advocated the abolition of military flogging, naval impressment, and imprisonment for debt. He carried, almost single-handed, the repeal of the old combination laws, the prohibition of the export of machinery, and the act preventing workmen from going abroad. He led forlorn hopes against colonial abuses, against town and country municipal self-elect government, election expenses, the licensing systems, the duties on paper, print, 'on tea, tobacco, and snuff.' He assaulted and carried by storm Orange lodges and close vestries, to say nothing of his aid of Catholic emancipation, the repeal of the test and

corporation with the return of 1832. He was the unrelenting persecutor of sinecurists, drones, and old men pretending to do the work of the young in the state. That of course he was a member of every liberal and radical club and association. He occupied for years the throne at the old Crown and Anchor Tavern, in Palace-yard, and in Covent-garden meetings."

In the preceding enumeration of Joseph Hume's political achievements the carrying of Orange lodges by storm has been mentioned—and as this event was little understood at the time, and was afterwards hushed up, some explanation of the event may be necessary. From Ireland these Orange institutions had been transplanted into England, where they took root and flourished, but where they also acquired a new and strange character from the change of soil and climate. Their avowed object was the preservation of the Protestant religion, but to effect this object they contemplated political changes such as the Orange societies of Ireland had never dreamt of. In 1828 they elected the Duke of Cumberland for their grand-master, and on ascending his Orange throne he appointed a certain Lieutenant-colonel Fairman as his envoy, to establish Orangeism wherever he could, and by whatever means he thought proper. This commission the colonel executed with zeal and secrecy at least, if not with honesty and loyalty: he went to Dublin for the purpose of combining its lodges with those of England, and traversed the island of Great Britain to establish lodges in the principal towns of England and Scotland. The last illness of George IV. and the carrying of the catholic emancipation act happened opportunely for the purpose, and the leaders of these mysterious associations began to express themselves more freely. They pretended that the religion of these Protestant kingdoms was to be overthrown, and that, in the event of the royal demise, the Duke of Wellington would seize the vacant throne. To avert such consequences, they also suggested that on the death of George IV. William should be set aside, and a regency formed, of which the Duke of Cumberland should be the head. The conspiracy, although a crazy one, and known to a few leaders, was also full of danger, as of the 381 lodges existing in Great Britain, 30 were in the army: their members were 140,000 in Great Britain, and 175,000 in Ireland, among whom were several peers and members of parliament, with a right reverend prelate for their grand chaplain. It was a coalition sufficient when the opportunity had arrived to overthrow a government and revolutionize a kingdom. But dark and treasonable as were its ulterior designs, the danger was revealed by the circulars of the lodges and the letters of Colonel Fairman, and the merit of the discovery was due to the energy and diligence of Mr. Hume. No sooner was the full blaze of daylight thrown upon this infamous plot than it shrank into helplessness, and even the members themselves were astonished at the designs of which they had been made the accomplices. A committee of inquiry was appointed in the House of Commons, the convicting letters and documents were laid before it, and Mr. Hume moved eleven resolutions, by which Orange lodges were suppressed, and the Duke of Cumberland censured. The exposure of the conspiracy had united all classes in politics against it, while the high rank and political influence of its leading members procured its extinction in a silent and gentle form. It was thus little noticed at the time, and is now almost forgot. And yet, it was not the less a slumbering volcano, that might be kindled at any moment, and the upheaving of which would

have been attended with dangers too great to calculate. Soon after the Duke of Cumberland became King of Hanover, and Queen Victoria peacefully succeeded to the British throne.

After the brief enumeration which we have given from the *Times* of a few of those principal objects to which the attention of Joseph Hume as a reformer was directed, we cannot do better than quote from another influential journal the following summary of the moral and political effects of his statesmanship during his long and active career:—"His greatest merit was his usefulness. An uncompromising honesty; an instinctive hatred of abuses; an innate love of liberty; and an unflinching will to extend its benefits to others—these, and the close experience of men derived by himself during the earlier part of his life, rendered Mr. Hume one of the most powerful, and at the same time one of the most practical, of reformers in a reforming age. Others might make more flowery speeches, but he secured more lasting fruits. His long, independent, and disinterested career; his untiring advocacy of the extension and improvement of the education of the people; his unflinching opposition to official abuses; his resolute exposure of their causes and consequences; his constitutional hatred of extravagance—enabled him to effect reforms of the most useful kind, of which few men have kept a record, but of which the effects are shown in the improved condition of the people, in the simplification and lucidity of the public accounts, in the establishment of a system of public morality till his time unknown, and, above all, in the guarantees established against the renewal of the abuses he overthrew. It would, however, be wrong to suppose that Mr. Hume's mind was contracted to the effecting mere pecuniary savings, although the mountain of abuses he had to destroy rendered necessary an incessant application to the task. He was a reformer of a higher order, quite capable of appreciating the influence of public honesty and morality on the national character, and desirous to elevate by education the standard of national intelligence. He met with his reward in the tardy but sincere homage paid to his integrity and long service by his most inveterate political opponents, and in the eulogy publicly passed on him by the most competent parliamentary judge of modern times—the late Sir Robert Peel. Mr. Hume passes to the grave honoured not more for his public services than for his private worth, his unswerving integrity, his unselfishness, his gentleness, and his unvarying consideration for others. His unostentatious but eminently successful and useful career remains as an example to those who may succeed him, in the admirable qualities he displayed, although happily his exertions have left them without the same field for their display."¹

After having shamed down the scorn and overcome the opposition of such a long political conflict—after having made his small minority the chief power in the state, and established his obnoxious principles as recognized axioms in British government—and after having been the artificer of his own fortune and fame, and risen from the office of an obscure surgeon to that of a leader in the British parliament and a statesman of European reputation, Mr. Hume died at his seat, Burnley Hall, Norfolk, on February 20, 1855, at the age of seventy-eight years. Such a long life amidst the incessant wear and tear of public action was owing to that *sana mens in corpore sano* for which he was so remarkable, combined with those regular and temperate habits from which he was never known to deviate. No difficulty could deter

¹ *Morning Chronicle*.

and no amount of labour weary him, and any crisis, however sudden or annoying, seemed to have no effect in ruffling his equanimity. He was always self-possessed, and always ready for the occasion, whether of the hour or the moment, while his square broad-set frame, the perfection of health, strength, and endurance, seemed not only to defy but to court opposition, in the sure confidence that he could bear it down and surmount it. Thus, even his qualities, physical as well as mental, were admirably accommodated to his field of action and the work that lay before him. At the time of his death, besides being M.P. for the Montrose district of burghs, he was deputy-lieutenant of Middlesex, a magistrate in Westminster and the counties of Middlesex and Norfolk, a vice-president of the Society of Arts, F.R.S. and F.R.A.S. He had also been twice lord-rector of the university of Aberdeen. He was survived by his wife and a numerous family; some of the latter are married—and although himself the most unpoetical and unideal of men, he was the father of two poets, of whom one, his eldest son, Mr. Joseph Burnley Hume, a barrister-at-law, published a poetical memoir of his parent; while the other, a daughter, dedicated to him a volume of her poetry, which was favourably received by the public. Amidst the universal excitement occasioned by the death of Mr. Hume, it was resolved to erect for him a national monument, and for the purpose of including every class of society, and every individual however poor in such a testimonial, it was resolved that the contribution of each subscriber should not exceed one penny. But the Crimean war which had already commenced, and the terrible Indian mutiny which followed, were of too exciting a character for the immediate realization of such a purpose. We trust, however, that although postponed it has not been abandoned, and that before the present generation passes away the proposal will be resumed of thus signaling the worth of a universal benefactor. In the meantime, the political history of Britain during the first half of the present century, and the manifold improvements in its government—form a monument to the memory of Joseph Hume more graceful than any mausoleum, and more lasting than any pyramid.

HUME, PATRICK, first Earl of Marchmont, a distinguished patriot and statesman, was born January 13th, 1641. His original place in society was that of the laird of Polwarth, in Berwickshire, being the eldest son of Sir Patrick Hume of Polwarth, the representative of an old baronial family, by Christian Hamilton, daughter of Sir Alexander Hamilton of Innerwick. The subject of our memoir succeeded his father in 1648, while as yet a mere child; and was accordingly indebted to his excellent mother for the better part of his early education. He appears to have been brought up by her in the strictest tenets of the Presbyterian religion, which flourished, without any constraint upon its private exercise, during all his early years, till it was discontinued by government after the Restoration. Sir Patrick, however, was not only an admirer of the form of worship enjoined by that religious system, but a zealous maintainer of its pretensions to a divine right as the only true church of Christ; and this, it is said, was what first inspired him with the feelings of a patriot. Having been sent to parliament in 1665 as representative of the county of Berwick, he soon distinguished himself by the opposition which he gave, along with the Duke of Hamilton and others, to the headlong measures of the government. In 1673 the king sent a letter to parliament desiring a levy of soldiers and

money to support them, and the Duke of Lauderdale moved that it be referred to the lords of the articles, who were always at the beck of government. This proposal, though strictly in accordance with the custom of the Scottish parliament, was opposed by the Duke of Hamilton, who asserted that the royal wishes ought to be considered by the whole assembled representatives of the nation. On Sir Patrick Hume expressing his concurrence with the duke, he was openly pointed out to parliament by Lauderdale as a dangerous person. Hereupon Sir Patrick said, "he hoped this was a free parliament, and it concerned all the members to be free in what concerned the nation." In the ensuing year he was one of those who went with the Duke of Hamilton to lay the grievances of the nation before the king, whose delusive answer to their application is well known. It was not possible that a person who maintained so free a spirit in such an age could long escape trouble. In 1675, having remonstrated against the measure for establishing garrisons to keep down the people, he was committed by the privy-council to the tolbooth of Edinburgh, as "a factious person, and one who had done that which might usher in confusion." After suffering confinement for six months in Stirling Castle, he was liberated through the intercession of friends, but not long after was again confined, and altogether suffered imprisonment for about two years. The order for his liberation, dated 17th April, 1679, states that "he had been imprisoned for reasons known to his majesty, and tending to secure the public peace;" and adds, "the occasions of suspicion and public jealousy being over, he is ordered to be liberate." To continue our memoir in the words of Mr. George Crawford,¹ who had received information from Sir Patrick's own mouth, "Finding after this that the ministers of state were most earnestly set on his destruction, and that he could not live in security at home, he went to England, and entered into a strict friendship with the Duke of Monmouth, the Earl of Shaftesbury, and the Lord Russell, who was his near relation. With them he often met, and had many conferences on the state of Scotland, and what might be done there to secure the kingdom from Popery and arbitrary power, in the event of a popish successor. But, as his lordship protested to me, there never passed among them the least intimation of any design against the king's life, or the Duke of York's; that was what they all had an abhorrence of. But he said he thought it was lawful for subjects, being under such pressures, to try how they might be relieved from them; and their design never went further."

Notwithstanding the pure intentions of this little band of patriots, the government, as is well known, was able to fasten upon them the charge of having conspired the deaths of the king and his brother; and to this infamous accusation Lord Russell fell a victim in England, and Mr. Baillie of Jerviswood in Scotland. It was on the 24th of December, 1684, that the latter individual suffered; before that time Sir Patrick Hume, though conscious of innocence, had gone into hiding, being justified in that step by a degree of personal infirmity, which unfitted him for enduring imprisonment. The place selected for his concealment was the sepulchral vault of his family, underneath the parish church of Polwarth, about two miles from Redbraes Castle, the house in which he generally resided. Here he lived for many weeks of the autumn of 1684, without fire and hardly any light, and surrounded by the ghastly objects

¹ *Lives and Characters of the Officers of the Crown, and of the State in Scotland.*

which usually furnish forth such a scene. He was comforted, however, by the firmness of his own mind and the affections of his amiable family to suffer this dreary self-imprisonment without shrinking. No one knew of his concealment but his family, and one "Jamie Winter," a carpenter, of whose fidelity they had good reason to be assured. Having been provided with a bed through the aid of this humble friend, Sir Patrick depended for food and other necessities upon the heroic devotedness of his daughter Grizel, who, though only twelve years of age, nightly visited this dismal scene, without manifesting the least agitation either on account of real or imaginary dangers. Supported by such means, Sir Patrick never lost his cheerfulness of temper, but, on the contrary, could laugh heartily at any little incident detailed to him by his daughter. The noble child had no other means of obtaining his food except by secreting part of what she had upon her own plate at the family meals. Her having one day secured an entire sheep's-head, which her younger brother Alexander thought she had swallowed in a moment, supplied one of those domestic jests with which the fugitive father was entertained. While in this lonely place, Sir Patrick had no other reading than Buchanan's Psalms, which he conned so thoroughly that he ever after had the most of them by heart. As the winter advanced Lady Polwarth contrived a retreat underneath the floor of a low apartment at Redbraes, and thinking that this might serve to conceal her husband in the event of any search taking place, had him removed to his own house, where he accordingly lived for some time, till it was found one morning that the place designed for concealment had become half filled with water.

Warned by this incident, and by the execution of his friend Mr. Baillie, he resolved to remain no longer in his native country. It was projected that he should leave the house next morning in disguise, attended by his griever or farm-overseer, John Allan, who was instructed to give out that he was going to attend a horse-market at Morpeth. The party stole away by night, and had proceeded a considerable distance on their way, when Sir Patrick, falling into a reverie, parted company with his attendant, and did not discover the mistake till he found himself on the banks of the Tweed. This, however, was a most fortunate misadventure, for, soon after his parting with Allan, a company of soldiers that had been in search of him at Redbraes, and followed in the expectation of overtaking him, came up, and would have inevitably discovered and seized him if he had not been upon another track. On learning what had happened, he dismissed his servant, and, leaving the main road, reached London through by-ways. On this journey he represented himself as a surgeon, a character which he could have supported effectually, if called upon, as he carried a case of lancets, and was acquainted with their use. From London he found his way to France, and thence, after a short stay, walked on foot to Brussels, intending to converse with the Duke of Monmouth. Finding the duke had gone to the Hague, he proceeded to Holland, but did not immediately obtain a conference with that ill-fated nobleman. He had an audience, however, of the Prince of Orange, who, "looking on him (to use the words of Crawford) as a confessor for the Protestant religion and the liberties of his country, treated him with a very particular respect."

On the death of Charles II., in February, 1685, and the accession of the Duke of York, whose attachment to the Catholic faith rendered him, in their eyes, unfit to reign, the British refugees in Holland concerted two distinct but relative expeditions, for

the salvation of the Protestant religion, and to maintain "the natural and native rights and liberties of the free people of Britain and Ireland, and all the legal fences of society and property there established." One of these expeditions was to land in England, under the Duke of Monmouth, whose prosecution of his own views upon the crown, under the favour of the Protestant interest, is well known. The other was to be under the conduct of the Earl of Argyle, and was to land in Scotland, where it was expected that an army would be formed in the first place from his lordship's Highland retainers, and speedily reinforced by the malcontents of Ayrshire and other parts of the Lowlands. Sir Patrick Hume has left a memoir respecting the latter enterprise, from which it clearly appears that Monmouth gave distinct pledges (afterwards lamentably broken) as to the deference of his own personal views to the sense of the party in general—and also that Argyle acted throughout the whole preparations, and in the expedition itself, with a wilfulness, self-seeking, and want of energy, which were but poorly compensated by the general excellence of his motives and the many worthier points in his character. Sir Patrick Hume and Sir John Cochrane of Ochiltree, alike admirable for the purity and steadiness of their political views, were next in command, or at least in the actual conduct of affairs, to the earl. The sword of the former gentleman is still preserved, and bears upon both sides of its blade the following inscription in German:

"Got bewarr die aufrechte Schotten,"

that is, God preserve the righteous Scots. It was not destined, however, that fortune should smile on this enterprise. The patriots sailed on the 2d of May, in three small vessels, and on the 6th arrived near Kirkwall in the Orkney Islands. The imprudent landing of two gentlemen, who were detained by the bishop, served to alarm the government, so that when the expedition reached the country of Argyle, he found that all his friends, upon whom he depended, had been placed under arrest at the capital. After trifling away several weeks in his own district, and affording time to the government to collect its forces, he formed the resolution of descending upon Glasgow. Meanwhile, Sir Patrick Hume and others were forfeited, their estates confiscated, and a high reward offered for their apprehension. While Argyle was lingering at Rothesay, Sir Patrick conducted the descent of a foraging party upon Greenock, and, though opposed by a party of militia, succeeded in his object. Allowing as largely as could be demanded for the personal feelings of this gentleman, it would really appear from his memoir that the only judgment or vigour displayed in the whole enterprise resided in himself and Sir John Cochrane. When the earl finally resolved at Kilpatrick to give up the appearance of an army, and let each man shift for himself, these two gentlemen conducted a party of less than a hundred men across the Clyde, in the face of a superior force of the enemy, and were able to protect themselves till they reached Muirdykes. Here they were assailed by a large troop of cavalry, and were compelled each man to fight a number of personal contests in order to save his own life. Yet, by a judicious disposition of their little force, and the most unflinching bravery and perseverance, Hume and Cochrane kept their ground till night, when, apprehending the approach of a larger body of foot, they stole away to an unfrequented part of the country, where they deliberately dispersed.

Sir Patrick Hume found protection for three weeks in the house of Montgomery of Lainshaw, where, or

at Kilwinning, it would appear that he wrote the memoir above alluded to, which was first printed in Rose's observations on Foxe's historical work, and latterly in the *Marchmont Papers* (1831). The better to confound the search made for him, a report of his death was circulated by his friends. Having escaped by a vessel from the west coast, he proceeded by Dublin to Bordeaux, where we find he was on the 15th of November. He now resumed his surgical character, and passed under the name of Dr. Peter Wallace. Early in 1686 he appears to have proceeded by Geneva to Holland, where his family joined him, and they resided together at Utrecht for three years. The picture of this distressed, but pious and cheerful family, is very affectingly given by Lady Murray, in the well-known memoirs of her mother, Lady Grizel Baillie. They were reduced to such straits through the absence of all regular income, that Lady Hume could not keep a servant, and Sir Patrick was obliged—but this must have been a labour of love—to teach his own children. They were frequently compelled to pawn their plate to provide the necessaries of life until a fresh supply reached them. Yet, even in this distress, their house was ever open to the numerous refugees who shared in their unhappy fate. Not forgetting political objects, Sir Patrick, in 1688, wrote a letter powerful in style and arguments, to put the Presbyterian clergy in Scotland on their guard against the insidious toleration which King James proposed for the purpose of effecting the ascendancy of Popery. In this document, which has been printed among the *Marchmont Papers* by Sir G. H. Rose, we find him giving an animated picture of the Prince of Orange, whom he already contemplated as the future deliverer of his country, and no doubt wished to point in that character to the attention of Scotsmen; "one," says he, "bred a Calvinist, who, for religious practice, excels most men so high in quality, and is equal to the most part of whatever rank of the sincere and serious in that communion; for virtue and good morals beyond many; those infirmities natural to poor mankind, and consistent with seriousness in religion, breaking out as little, either for degree or frequency, from him, as from most part of good men, and not one habitual to him: one of a mild and courteous temper; of a plain, ingenuous, and honest nature; of a humane, gay, and affable carriage, without any token of pride or disdain; one educated and brought up in a republic as free as any in the world, and inured to the freedom allowed by and possessed in it. His greatest enemy, if he know him, or my greatest enemy, if he read this, must find his own conscience witnessing to his face, that what I have said is truth, and that I am one of more worth than to sully my argument with a flaunting hyperbole even in favour of a prince." The modern reader, who is acquainted with the picture usually drawn of the same personage by the English historians, will probably be startled at the gayety and affability here attributed to the prince; but, besides the unavoidable prepossession of Sir Patrick for a person who, it would appear, had treated him kindly, and stood in the most endearing relation to all his favourite objects in religion and politics, it must be allowed that, at an age which might be called youth (thirty-eight), and previous to his undertaking the heavy and ungrateful burden of royalty in Britain, William might have been better entitled to such a description than he was in the latter part of his life.

Before this time the eldest son of Sir Patrick Hume, and his future son-in-law, Baillie, had obtained commissions in the horse-guards of the Prince of Orange, in whose expedition to England all three

soon after took a part. These gentlemen were among those who suffered in the storm by which a part of the prince's fleet was disabled; they had to return to port with the loss of all their luggage, which in the existing state of their affairs was a very severe misfortune. The little party appears to have speedily refitted and accompanied the prince at his landing in Devonshire, as we find Sir Patrick writing a diary of the progress to London, in which he seems to have been near the prince all the way from Exeter. In the deliberations held at London respecting the settlement of the new government, Sir Patrick bore a conspicuous part; but it was in Scotland that his zeal and judgment found a proper field of display. In the convention parliament, which sat down at Edinburgh, March 14, 1689, he appeared as representative of the county of Berwick; and, an objection being made on the score of his forfeiture, he was unanimously voted a member by the house. The decision of this assembly in favour of a settlement of the crown upon William and his consort Mary soon followed.

The career of public service was now opened to the subject of our memoir at a period of life when his judgment must have been completely matured, and after he had proved, by many years of suffering under a tyrannical government, how worthy he was to obtain honours under one of a liberal complexion. In July, 1690, his attainder was rescinded by act of parliament; he was soon after sworn a member of the privy-council; and in December, 1690, he was created a peer by the title of Lord Polwarth. The preamble of the patent is a splendid testimony to the eminent virtues he had displayed in asserting the rights and religion of his country. King William at the same time vouchsafed to him an addition to his armorial bearings, "an orange proper ensigned, with an imperial crown, to be placed in a surcoat in his coat of arms in all time coming, as a lasting mark of his majesty's royal favour to the family of Polwarth, and in commemoration of his lordship's great affection to his said majesty."

From this period the life of Lord Polwarth is chiefly to be found in the history of his country. He was appointed in 1692 to be principal sheriff of Berwickshire, and in 1693 to be one of the four extraordinary lords of session. Though there is no trace of his having been bred to the law, his conduct in these two employments is said to have been without blemish. His reputation, indeed, for decisions conformable to the laws, for sagacity and soundness of judgment, is perhaps one of the most remarkable parts of the brilliant fame which he has left behind him. In 1696 he attained the highest office in Scotland, that of lord-chancellor, and in less than a year after he was promoted in the peerage by the titles Earl of Marchmont, Viscount of Blasonberry, Lord Polwarth, Redbraes, and Greenlaw, to him and to his heirs male whatsoever. He was soon after named one of the commission of the treasury and admiralty; and in 1698 was appointed lord high-commissioner to represent the king's person in the parliament which met at Edinburgh in July of that year. To follow up the statement of Sir George Rose, who gives a sketch of the life of the earl in his preface to the *Marchmont Papers*, "his correspondence with King William and his ministers, whilst he exercised these high functions, exhibits an earnest and constant desire to act, and to advise, as should best promote at once the honour of his master and benefactor, and the weal of the state; and he had the good fortune to serve a prince who imposed no duties upon him which brought into conflict his obligations to the sovereign and to his country."

The Earl of Marchmont was acting as commissioner at the General Assembly of 1702, when the death of his affectionate sovereign interrupted the proceedings, and plunged him into the deepest grief. He was appointed by Queen Anne to continue to preside over the assembly till the conclusion of its proceedings; but the principles of this great man were too rigid to allow of his long continuing in office under the new government. In his letter to Queen Anne, written on the death of King William, he was too little of a courtier to disguise the feelings which possessed him as a man, although he must have known that every word he used in admiration or lamentation of her predecessor must have been grating to her ears. In the first session of the parliament after her accession he presented to it an act for the abjuration of the Pretender; and, though it was in conformity to, and in imitation of, the English act passed immediately on her ascending the throne, and was read a first time, the high-commissioner adjourned the house in order to stop the measure. In a memorial to the queen of the 1st of July, 1702 (*Marchmont Papers*), will be found a full vindication of his conduct in this matter, and a statement of that held by his friends and the commissioner, the Duke of Queensberry, differing essentially from Lockhart's. He was on this dismissed from his office of chancellor, the place being conferred on the Earl of Seafield.

Having thus sacrificed his office to his principles, he pursued the latter in the ensuing parliaments with the consistency and fervour which might have been expected from such a man. The Protestant succession in the house of Hanover, and the union of the two divisions of the island under one legislature, were the two objects on which he now centered his attention and energies. It is hardly necessary to remind the reader that the general temper of the Scottish people was perversely opposed to both of these measures, and that it was only the minority of such consistent Whigs as Lord Marchmont, who, reposing more upon great abstract principles than narrow views of immediate advantage, saw them in their proper light, and gave them the weight of their influence. An attempt of the earl to introduce an act for the Hanover succession, at a time when his fellow-statesmen were chiefly bent on asserting by the act of security the abstract independence of their country, was so ill received that there was even some talk of consigning this noble patriot to the state-prison in Edinburgh Castle. Afterwards, however, when the government of Queen Anne was obliged to adopt the measure of a union, his lordship had the pleasure of contributing his aid—and most willingly was it rendered—towards what had been the grand object of his political life. The selection of the Scottish commissioners, upon which the whole matter hinged, was effected in obedience to a sagacious advice tendered by Lord Marchmont—namely, that they should be “the most considerable men, provided they were Whigs, and therefore friends to the Revolution; but such alone, with disregard to their feelings respecting an incorporating union as hostile to it or not.” The reasonings he employed to enforce this principle of selection are to be found in the *Marchmont Papers*; and we learn from Lockhart to how great an extent they were acted on. Speaking of the commissioners, this gentleman says, that “all were of the court or Whig interest except himself,” an ardent Jacobite, an exception only made in the hope of gaining him through his uncle, the Whig Lord Wharton. It is universally allowed that this principle, though the author of it has not heretofore been very distinctly known, achieved the union.

We are now to advert to a circumstance of a pain-

ful nature respecting the Earl of Marchmont, but which we have no doubt has taken its rise either from error or from calumny. As a leader of the independent party in the Scots parliament—called the *Squadron Volante*—it is alleged that his lordship was one of those individuals who were brought over to the government views by bribery; and Lockhart actually places the sum of £1104, 15s. 7d. against his name, as his share of the £20,000 said to have been disbursed by the English exchequer, for the purpose of conciliating the chief opponents of the measure. Sir George H. Rose has made an accurate and laborious investigation into the foundation of these allegations, from which it would not only appear that Lord Marchmont has been calumniated, but that a very incorrect notion has hitherto prevailed respecting the application of the money above referred to. We must confess that it has always appeared to us a most improbable story, that, even in the impoverished state of Scotland at that time, noblemen, some of whom were known to entertain liberal and enlightened views, and had previously maintained a pure character, were seduced by such trifling sums as those placed against them in the list given by Lockhart. Sir George Rose has shown, to our entire satisfaction, that the sum given on this occasion to the Earl of Marchmont was a payment of arrears due upon offices and pensions—in other words, the payment of a just debt; and that he is not blamable in the matter, unless it can be shown that receiving the payment of a debt can under any circumstances be disgraceful to the creditor. The best proof of his lordship's innocence is to be found in his conduct at the union, and for years before it. It is clear from his letters to the English statesmen, that the union was an object which he constantly had at heart, and that, so far from being drawn over by any means whatever to their views, he had in reality urged them into it with all his strength and spirit, and all along acted with them in the negotiations by which it was effected. Money does not appear to have been so abundant on this occasion, as to make it probable that any was spent, except upon opponents.

The Earl of Marchmont offered himself as a candidate at the election of the Scots representative peers in 1707, and again on the dissolution of parliament in 1708, but in each case without success. He could scarcely calculate on the countenance of Queen Anne's government; for, if he had rendered it eminent services, he had also taught it how uncompromising was his adherence to his principles. Thus his parliamentary life ceased with the union. But his letters written subsequently to it give evidence that his mind was engaged deeply in all the events affecting the weal and honour of his country. Nor was his patriotism deadened by the insult and injury he received from the court, when, at the accession of the Tory ministry in 1710, he was deprived of his office of sheriff of Berwickshire, which was conferred on the Earl of Home.

In 1703 Lord Marchmont had the misfortune to lose his amiable and affectionate spouse, of the family of Ker of Cavers, to whose virtues he has left a very affecting testimony. In 1709 he suffered a hardly less severe calamity in the death of his eldest son Lord Polwarth, a colonel of cavalry, who, beginning his service in King William's body-guard, served through his wars and the Duke of Marlborough's with reputation, and died childless, though twice married. He was treasurer-depute in 1696. His amiable and honourable character fully justified his father's grief. The second brother Robert, also a soldier, died many years before him.

The accession of George I. gave to Lord Marchmont what he called the desire of his heart, a Protestant king upon the throne. He was immediately re-appointed sheriff of Berwickshire. In 1715, in the seventy-fifth year of his age, acting on the feelings and principles of his youth, he forbade a meeting of the gentlemen of the county, which had been proposed in the professed view of obtaining a redress of hardships, but which would have embarrassed the newly established government; and his lordship took the necessary precautions to render his prohibition effectual. When he saw the Protestant succession secure, he gave up all thoughts of active life, and removed to Berwick-on-Tweed, to spend the remainder of his days in retirement. He retained his cheerful disposition to the last. A short time before his death he was visited by his daughter Lady Grizel Baillie, and his grand-children, who, with a number of his friends, had a dance. Being then very weak in his limbs he was unable to come down-stairs, but desired to be carried down to see them; and, as pleasingly recorded by his granddaughter Lady Murray, he was so much delighted with the happy faces he saw around him, that he remarked, "though he could not dance, he could yet beat time with his foot."

On the 1st of August, 1724, this illustrious patriot breathed his last at Berwick, in the eighty-third year of his age, leaving one of the most irreproachable characters which have come down to us from that time, if not from others of greater general virtue. He had become so reconciled to the prospect of death, that, though no doubt sensible of the solemn change which it was to produce, he could make it the subject of a gentle mirth. Being observed to smile, he was asked the reason by his grandson, the ingenious Lord Binning, to whom he answered, "I am diverted to think what a disappointment the worms will meet with, when they come to me expecting a good meal, and find nothing but bones." Lord Marchmont, be it remarked, though at one time a handsome man, had always been of a spare habit of body, and was now much attenuated. His character has already been sufficiently displayed in his actions and the slight commentaries we have ventured to make upon them. It is impossible, however, to refrain from adding the testimony of Fox, who, in his historical work, says of him, as Sir Patrick Hume, that "he is proved, by the whole tenor of his life and conduct, to have been uniformly zealous and sincere in the cause of his country."

HUME, ALEXANDER, second Earl of Marchmont, the eldest surviving son and successor of the first earl, having maintained the historical lustre of the family, deserves a place in the present work, though only perhaps in a subordinate way. He was born in 1675, and in his boyhood shared the exile and distress of his family. Before his elder brother's death he was distinguished as Sir Alexander Campbell of Cessnock, having married the daughter and heiress of that family. He was brought up as a lawyer, and became a judge of the Court of Session before he was thirty years of age. He was a privy-councillor and a baron of the Court of Exchequer, and served in the Scottish parliament, first for Kirkwall, and then for Berwickshire, when the act of union passed. Emulating his father's feelings, he zealously promoted that measure, and took a very active share in the arduous labours that were devolved upon the sub-committee, to which the articles of the union were referred.

But the principal historical transaction in which this nobleman was concerned, was the introduction

of the family of Hanover to the British throne. A report having been circulated that the electoral family was indifferent to the honours opened up to them by the act of succession, Lord Polwarth (for he had now attained this designation) proceeded in 1712 to Hanover, and entered into a correspondence with the august family there resident, which enabled him fully to contradict the rumour. He took a leading part in suppressing the rebellion of 1715, by which that succession was sought to be defeated, and in 1716 was rewarded for his services by being appointed ambassador to the court of Denmark.

After acceding to the family honours in 1722, the Earl of Marchmont was honoured with several important places of trust under government, till joining the opposition against the excise scheme of Sir Robert Walpole, he forfeited the favour of the court and his place as a privy-councillor, which he then held. "It appears," says Sir George Henry Rose,¹ "that the distinguished members of the Scottish nobility who joined in this act of hostility to the ministers, were less induced so to do by any particular objections to that measure of finance, than by the hope that their junction with the English who resisted it might lead to the subversion of Lord Ilay's government of Scotland, a rule which they felt to be painful and humiliating. They knew it moreover to be sustained by means, many of which they could not respect, and which they believed to tend to degrade and alienate the nation. That they judged rightly in apprehending that the system adopted by Sir Robert Walpole and his virtual viceroy for the management of the public affairs in North Britain was ill calculated to conciliate to the reigning family the affections of the people, was but too sufficiently proved by subsequent events. He sat as one of the sixteen Scots peers in the parliament of 1727; but at the general election in 1754 the hand of power was upon him; and being excluded, he, together with the Dukes of Hamilton, Queensberry, and Montrose, the Earl of Stair, and other Scottish noblemen, entered into a concert with the leading English members of the opposition, in order to bring the machinations unsparingly used to control the election of the peers in Scotland to light, and their authors to punishment. Sir Robert Walpole's better fortune, however, prevailed against it, as it did against a similar project in 1739." The Earl of Marchmont died in January, 1740, and was succeeded by his eldest surviving son Hugh, who was destined to exhibit the extraordinary spectacle of a family maintaining in the third generation the same talent, judgment, and worth which had distinguished the two preceding.

HUME, HUGH CAMPBELL, third and last Earl of Marchmont, was born at Edinburgh on the 15th February, 1708, and soon became remarkable for the precocity of his intellect and the versatility of his genius. His mind was equally directed to the acquisition of scholastic erudition and political knowledge, and on all subjects he was supposed to be excelled by few or none of his time. In 1734, when only twenty-six years of age, he was chosen member for the county of Berwick, and entered the House of Commons as Lord Polwarth, at the same time that his younger and twin brother, Mr. Hume Campbell, came forward as representative for the burghs of the district. The injustice and neglect which Sir Robert Walpole had shown to Lord Marchmont was speedily avenged by the trouble which these young men gave to his government. The former soon attained the first place in the opposition; and how keenly his attacks were felt by the ministry is shown in a remark

¹ Preface to *Marchmont Papers*.

made by the latter person, to the effect that "there were few things he more ardently desired than to see that young man at the head of his family," and thus deprived of a seat in the house. This wish was soon gratified, for his father dying in 1740, Lord Polwarth succeeded as Earl of Marchmont; nor did he again enter the walls of parliament until the year 1750, when a vacancy occurring in the representation of the Scottish peerage, he was almost unanimously elected. From his talents as a speaker, his extensive information, and active business habits, he acquired great influence in the upper house, and was constantly rechosen at every general election during the long period of thirty-four years. He was appointed first lord of police in 1747, and keeper of the great seal of Scotland in January, 1764, the latter of which he held till his death. The estimation in which his lordship was held by his contemporaries may be judged of by the circumstance of his living on terms of the strictest intimacy with the celebrated Lord Cobham (who gave his bust a place in the Temple of Worthies at Stow), Sir William Wyndham, Lord Bolingbroke, the Duchess of Marlborough, Mr. Pope, and other eminent persons of that memorable era. The duchess appointed him one of her executors, and bequeathed him a legacy of £2500 for his trouble, and as a proof of her esteem. Mr. Pope likewise appointed him one of his executors, leaving him a large-paper edition of *Thuanus*, and a portrait of Lord Bolingbroke, painted by Richardson. The poet likewise immortalized him by introducing his name into the well-known inscription in the Twickenham grove:—

"Then the bright flame was shot through Marchmont's soul."

His lordship's library contained one of the most curious and valuable collections of books and manuscripts in Great Britain—all of which he bequeathed at his death to his sole executor, the Right Honourable George Rose.

His lordship was twice married; first, in 1731, to Miss Western of London, by whom he had four children, a son (who died young), and three daughters, the youngest of whom was afterwards married to Walter Scott, Esq., of Harden. Upon the death of his wife in 1747 he next year married a Miss Elizabeth Crompton, whose father was a linendraper in Cheap-side, by whom he had one son, Alexander, Lord Polwarth, who died without issue, in the thirty-first year of his age. The circumstances attending this second marriage were very peculiar, and his lordship's conduct on the occasion seems altogether so much at variance with his general character, as well as with one in his rank and circumstances in life, that we reckon them worthy of being recorded here;—and in doing so, we think we cannot do better than adopt the account of them given by the celebrated David Hume, in a familiar epistle to Mr. Oswald of Dunnikier, and published in the latter gentleman's correspondence. The letter is dated London, January 29th, 1748:—"Lord Marchmont has had the most extraordinary adventure in the world. About three weeks ago he was at the play, when he espied in one of the boxes a fair virgin, whose looks, airs, and manners had such a powerful and wonderful effect upon him as was visible by every by-stander. His raptures were so undisguised, his looks so expressive of passion, his inquiries so earnest, that every person took notice of it. He soon was told that her name was Crompton, a linendraper's daughter, that had been bankrupt last year, and had not been able to pay above five shillings in the pound. The fair nymph herself was about sixteen or seventeen, and being supported by some relations, ap-

peared in every public place, and had fatigued every eye but that of his lordship, which, being entirely employed in the severer studies, had never till that fatal moment opened upon her charms. Such and so powerful was their effect as to be able to justify all the Pharamonds and Cyrusses in their utmost extravagancies. He wrote next morning to her father, desiring to visit his daughter on honourable terms: and in a few days she will be the Countess of Marchmont. All this is certainly true. They say many small fevers prevent a great one. Heaven be praised that I have always liked the persons and company of the fair sex! for by that means I hope to escape such ridiculous passions. But could you ever suspect the ambitious, the severe, the bustling, the impetuous, the violent Marchmont, of becoming so tender and gentle a swain—an Artamenes—an Oronodates!"

His lordship died at his seat, at Hemel Hempstead in Hertfordshire, on the 10th of January, 1794, and leaving no heirs male, all the titles of the family became extinct; but his estate descended to his three daughters. According to Sir George H. Rose, who, from his family connection with the Earl of Marchmont, had the best means of knowing, this nobleman "was an accomplished and scientific horseman, and a theoretical and practical husbandman and gardener. He pursued his rides and visits to his farm and garden as long as his strength would suffice for the exertion; and some hours of the forenoon, and frequently of the evening, were dedicated to his books. His most favourite studies appear to have been in the civil law and in the laws of England and Scotland, in the records and history of the European nations, and in ancient history; and the traces of them are very unequivocal. The fruits of his labours in extracts, observations, comparisons, and researches—all made in his own handwriting—are not more to be admired than wondered at, as the result of the industry of one who was stimulated neither by poverty nor by eagerness for literary celebrity. His Dutch education had given him method, which was the best possible auxiliary to an ardent and powerful mind, such as his was."

In the publication which we have entitled the *Marchmont Papers*, are many of Earl Hugh, of which the most important feature is a diary, which he kept during three different periods of peculiar interest in the reign of George II. The first extends from the latter end of July, 1744, to the end of that year, and embraces the events which led to the formation of what was called the Broad-bottom Administration, when Lord Carteret, who just then became Earl of Granville, was compelled to retire by the Pelhams, the king consenting thereto very reluctantly, and when the Dukes of Devonshire, Bedford, and Dorset, and the Earls of Harrington and Chesterfield, came into office. The second period begins in September, 1745, when news had just been received in London that the Pretender was near Edinburgh, and that it would probably be soon in his occupation. It closes in the February following, with the extraordinary events of that month, the resignation of the Pelham ministry, and its re-establishment after the Earl of Bath's and the Earl of Granville's interregnum of three days. The third period commences in July, 1747, and terminates in March, 1748, soon after the Earl of Chesterfield's resignation, and the Duke of Bedford's appointment to succeed him as secretary of state.

HUME, PATRICK, is noticed by various writers as the name of an individual who adorned the literature of his country at the close of the seventeenth

century. Who or what he was is not known: it is only probable, from the regularity with which certain first names occur in genealogies in connection with surnames, that he belonged to the Polwarth branch of the family of Home, or Hume, as in that branch there were six or seven successive barons bearing the name of Patrick. This learned man is only known to have written the notes connected with the sixth edition of Milton's *Paradise Lost*, which was published in folio by Tonson in 1695, and is one of the most elegant productions of the British press that have ever appeared. It has been a matter of just surprise to several writers of Scottish biography, that absolutely nothing should have been handed down respecting this person, seeing that his notes evince a high degree of taste and most extensive erudition, and are in fact the model of almost all commentaries subsequent to his time. "His notes," says an anonymous writer,¹ "are always curious; his observations on some of the finer passages of the poet show a mind deeply smit with an admiration for the sublime genius of their author; and there is often a masterly nervousness in his style, which is very remarkable for this age." But the ignorance of subsequent ages respecting the learned commentator is sufficiently accounted for by the way in which his name appears on the title-page, being simply in initials, with the affix *φιλοποιητης*, and by the indifference of the age to literary history. It would appear that the commentary, learned and admirable as it is, speedily fell out of public notice, as in 1750 the Messrs. Foulis of Glasgow published the first book of the *Paradise Lost*, with notes by Mr. Callender of Craigforth, which are shown to be, to a great extent, borrowed from the work of Hume, without the most distant hint of acknowledgment.

HUNTER, DR. HENRY, a divine highly distinguished in literature, was born at Culross in the year 1741. His parents, though in humble life, gave him a good education, which was concluded by an attendance at the university of Edinburgh. Here his talents and application attracted the notice of the professors, and at the early age of seventeen he was appointed tutor to Mr. Alexander Boswell, who subsequently became a judge of the Court of Session under the designation of Lord Balmouto. He afterwards accepted the same office in the family of the Earl of Dundonald at Culross Abbey, and thus had the honour of instructing the venerable earl, so distinguished by his scientific inquiries and inventions. In 1764, having passed the necessary trials with unusual approbation, he was licensed as a minister of the gospel, and soon excited attention to his pulpit talents. So highly were these rated in public esteem, that in 1766 he was ordained one of the ministers of South Leith, which has always been considered as one of the most respectable appointments in the Scottish church. He had here ingratiated himself in an uncommon degree with his congregation, when a visit to London in 1769 opened up to his ambition a still wider field of usefulness. The sermons which he happened to deliver on this occasion in several of the Scottish meeting-houses drew much attention, and the result was an invitation, which reached him soon after his return, to become minister of the chapel in Swallow Street. This he declined; but in 1771 a call from the London Wall congregation tempted him away from his Scottish flock, who manifested the sincerest sorrow at his departure. This translation not only was an ad-

vancement in his profession, but it paved the way for a series of literary exertions, upon which his fame was ultimately to rest. Several single sermons first introduced him to the world as an author. These were on the ordination of O. Nicholson, M.A., 1775, 2 Cor. iv. 7, 8; On the Study of the Sacred Scriptures, Acts xviii. 11, in the work called the *Scottish Preacher*, vol. iv.; at the funeral of the Rev. George Turnbull, 1783; On the opening of a Meeting-house at Walthamstow in 1787, Rev. xxi. 3, 4; On the Revolution, 1788; The Believer's Joy, Acts viii. 39; also in the fourth volume of the *Scottish Preacher*. These sermons, with some miscellaneous pieces, were collected and published in two volumes after the author's death. Dr. Hunter first appeared as a general writer in 1783, when he published the first volumes of his "*Sacred Biography, or the History of the Patriarchs and of Jesus Christ*," which was ultimately extended to seven volumes, and has become a standard work, the seventh edition having appeared in 1814. Before this work was completed, the notice attracted by the system of Lavater throughout civilized Europe tempted him to engage in an English version of the *Physiognomy* of that philosopher, whom he previously visited at his residence in Switzerland, in order to obtain from the conversation of the learned man himself as perfect an idea as possible of his particular doctrines. It is said that Lavater at first displayed an unexpected coolness on the subject of Dr. Hunter's visit, being afraid that an English translation might injure the sale of the French edition, in which he had a pecuniary interest. This, however, seems to have been got over; for Lavater eventually treated his English visitor in a manner highly agreeable. "As their professions were alike," says an anonymous writer, "so their sentiments, their feelings, and their opinions are altogether alike. A complete acquaintance with the French language enabled Dr. Hunter to enjoy Lavater's conversation freely; and he ever afterwards talked with enthusiasm of the simplicity of manners, the unaffected piety, the unbounded benevolence, and the penetrating genius of this valued friend. The bare mention of that barbarous cruelty which massacred the virtuous Lavater was sufficient to make him shrink back with horror." The first number of this work was published in 1789, and it was not completed till nine years after, when it ultimately formed five volumes in quarto, bearing the title of "*Essays on Physiognomy*, designed to promote the Knowledge and Love of Mankind, by John Caspar Lavater." Dr. Hunter's abilities as a translator were of the first order, and, in this instance, drew forth the entire approbation of the original author. The work was, moreover, embellished in a style which at that time might be considered as unrivalled. It contained above eight hundred engravings, executed by and under the direction of Mr. Holloway, and such was altogether the elaborate elegance of the publication, that it could not be sold to the public under thirty pounds per copy. We are only left to regret that so much talent, so much taste, and such a large sum of money as this price would indicate, should have been spent upon an inquiry which the acute and precise sense of the immediately succeeding generation has pronounced to be in a great measure a delusion.

At the time of the French revolution Dr. Hunter republished a treatise by Robert Fleming, whose life, with an account of the work in question, has already been given in this *Biographical Dictionary*. The pamphlet contained some prophetic intimations, which Dr. Hunter supposed to bear a reference to the events in the neighbouring kingdom. Dr.

¹ *Blackwood's Magazine*, iv. 662, where there is a series of extracts from Hume's *Commentary*, in contrast with similar passages from that published by Mr. Callender of Craigforth.

Hunter also published a *Sermon preached February 3, 1793, on the Exaltation of Louis XIV.*

In 1795 he attempted a translation from the German, selecting for this purpose Euler's celebrated *Letters to a German Prince*. This work met with the entire approbation of the public, and has proved a very useful addition to the stock of our native scientific literature. The first edition was in quarto, and a second in octavo appeared in 1802. The work has since been reprinted in a smaller size, with notes by Sir David Brewster. The merit of Dr. Hunter as a translator was now universally acknowledged, and work accordingly pressed upon him. While still engaged in his version of Lavater, he commenced in 1796 the publishing of a translation of St. Pierre's *Nation of Nature*, which was completed in 1799, in five volumes octavo, afterwards republished in three. "His translation," says the anonymous writer above quoted, "of the beautiful and enthusiastic works of St. Pierre was universally read and admired: here, if in any instance, the translator entered into the spirit of the author, for the glow of benevolence which gives life to every page of *Les Etudes de la Nature* was entirely congenial to the feelings of Dr. Hunter." Saurin's *Sermons* and Sonnini's *Travels to Upper and Lower Egypt* complete the list of Dr. Hunter's labours as a translator; and it is but small praise to say that few men have reached the same degree of excellence in that important branch of literature. During the progress of other labours Dr. Hunter published more than one volume of original sermons, and a volume entitled *Lectures on the Evidences of Christianity*, being the completion of a plan begun by the Rev. John Fell. He also commenced the publication, in parts, of a popular *History of London and its Environs*, which however he did not live to complete.

In the year 1790 Dr. Hunter was appointed secretary to the corresponding board of the Society for Propagating Christian Knowledge in the Highlands and Islands of Scotland. He was likewise chaplain to the Scots corporation in London, and both these institutions were much benefited by his zealous exertions in their behalf. It must be obvious, from the frequent and involved succession of his literary productions, that Dr. Hunter spent a most industrious life, and was upon the whole the most busy as he approached that stage of existence when the generality of men begin to find ease not only agreeable but necessary. It is probable that this unceasing exertion, which no doubt was more occasioned by necessity than by choice, tended to break down his constitution, which was further weakened in his latter years by the agitation and distress of mind consequent on the death of three beloved children. Having retired to Bristol wells for the recovery of his health, he died there, of inflammation in the lungs, October 27, 1802, in the sixty-second year of his age.

"If Dr. Hunter," says his anonymous biographer,¹ "was conspicuous as an author, he was still more to be admired as a man. An unbounded flow of benevolence, which made him enjoy and give enjoyment to every society, joined to a warmth of feeling which made him take an interest in every occurrence, rendered him the delight of all his acquaintance. His social talents were of the highest order. An easy flow of conversation, never loud, never overbearing, and completely free from affectation; an inexhaustible fund of pleasant anecdotes, and occasional flashes of wit and humour, made every company he joined pleased with him and with themselves. He was particularly happy in adapting his conversation to those

he conversed with; and while to a lady his discourse appeared that of a polished gentleman, the scholar was surprised by his apt quotations from the classics, and the ease with which he turned to any subject that was brought before him. . . . His private charities were as numerous as the objects of compassion which occurred to him; nor should his unbounded and cheerful hospitality be forgot among his other virtues." [He is said to have carried this virtue beyond the bounds which a regard to prudence and economy should have prescribed.] "The crowded attendance and the universal regret of his congregation are the best proofs of the effect of his pulpit eloquence. His enlightened and liberal views of religion made his meeting-house the resort of the leading Scotsmen in London; and it was here that the natives of the southern part of the island had an opportunity of observing a specimen of that church which produced a Robertson and a Blair. . . . Dr. Hunter was of a spare habit of body, and remarkably active; and his usual cheerfulness and flow of good humour continued till within a few weeks of his death." He left a family, consisting of a wife, two sons, and a daughter.

HUNTER, WILLIAM and JOHN, two eminent physicians, fall to be noticed here under one head, in order that we may, without violating alphabetical arrangement, give William that priority to which his seniority and precedence in public life entitle him.

WILLIAM HUNTER was born May 23, 1718, at Kilbride, in the county of Lanark. His great-grandfather, by his father's side, was a younger son of Hunter of Hunterston. His father and mother lived on a small estate in the above county, called Calderwood, which had been some time in the possession of their family. They had ten children, of whom the subject of our present memoir was the seventh, while John was the tenth. One of his sisters married the Rev. James Baillie, professor of divinity in the university of Glasgow, and became the mother of Matthew Baillie, the celebrated physician, whose labours in morbid anatomy have been of such essential service in promoting the study of pathology. William Hunter was sent to the college of Glasgow at the age of fourteen, where he pursued his studies with diligence, and obtained the esteem of the professors and his fellow-students. He was at this time designed for the church, but hesitated, from conscientious motives, to subscribe all the articles of its faith. Such was the state of his mind when he became acquainted with the eminent Dr. Cullen, who was then established in practice at Hamilton, under whom he resolved to devote himself exclusively to the profession of medicine. Accordingly, having obtained the consent of his father, in the year 1737 he went to reside with Dr. Cullen, in whose family he lived nearly three years—a period which ever afterwards he looked back upon with peculiar pleasure. Between these two gifted individuals a partnership was now formed, and it was agreed that William Hunter should take charge of the surgical and Dr. Cullen of the medical cases that occurred in their practice. To carry their mutual wishes more efficiently into operation, it was arranged that William Hunter should proceed to Edinburgh, and then to London, for the purpose of pursuing his medical studies in each of these cities, after which, that he should return to settle at Hamilton.

In November, 1740, William Hunter went to Edinburgh, where he remained until the following spring, attending the lectures of the medical professors there, among whom he had the advantage of attending Dr. Alexander Monro, who was one of the

¹ *Obituary of Gentlemen's Magazine*, lxxii. 1772.

most talented and able professors who perhaps ever adorned that university. In the summer of 1741 he proceeded to London, and resided with Mr. (afterwards Dr.) Smellie, then an apothecary in Pall Mall. He took with him a letter of introduction from Mr. Foulis, the printer at Glasgow, to Dr. James Douglas. At first Mr. Hunter commenced the study of anatomy under the tuition of Dr. Frank Nicholls, who was the most eminent teacher of anatomy then in London, and who had formerly professed the science at Oxford. It appears that Dr. Douglas had been under some obligation to Mr. Foulis, who had procured for him several editions of Horace, and he naturally, therefore, paid attention to young Hunter, whom he at once recognized to be an acute and talented observer. Dr. Douglas was at that time intent on a great anatomical work on the bones, which he did not live to complete, and was looking out for a young man of industry and ability to employ as his dissector. He soon perceived that his new acquaintance would be an eligible assistant, and after some preliminary conversation, invited him into his family, for the double purpose of aiding him with his dissections, and directing the education of his son. The pecuniary resources of young Hunter were at this time very slender, and the situation was to him therefore highly advantageous; but it was with difficulty that he could obtain the consent of his father for him to accept it, who being now old and infirm, awaited with impatience his return to Scotland. Ultimately, however, he was prevailed on to acquiesce in the wishes of his son, which he did with reluctance; he did not, however, long survive, as he died on the 30th of the October following, aged seventy-eight. Mr. Hunter's previous arrangements with Dr. Cullen formed no obstacle to his new views; for he had no sooner explained his position than Dr. Cullen, anxious for his advancement, readily cancelled the articles of agreement. At liberty now to take advantage of all the means of instruction by which he was surrounded, he pursued his studies with assiduity. By the friendly assistance of Dr. Douglas he was enabled to enter himself as a surgeon's pupil at St. George's Hospital, under Mr. James Wilkie, and as dissecting pupil under Mr. Frank Nicholls. He also attended a course of experimental philosophy, which was delivered by Desaguliers. He soon became very expert as a dissector, inasmuch that Dr. Douglas went to the expense of having several of his preparations engraved. But he did not enjoy his liberal patronage and aid long, for many months had not elapsed when his kind benefactor died—an event which happened April 1, 1742, in the sixty-seventh year of his age. Dr. Douglas left a widow and two children; but his death made no alteration in respect to Mr. Hunter, who continued as before to reside in his family, and perform the same duties which he had previously done.

In the year 1743 the first production from the pen of Mr. Hunter was communicated to the Royal Society. It was an *Essay on the Structure and Diseases of Articulating Cartilages*—a subject which had not been at that time sufficiently investigated, and on which his observations threw considerable light. His favourite scheme was now to commence as a lecturer on anatomy; but he did not rashly enter on this undertaking, but passed some years more in mastering the necessary knowledge, and in making the numerous preparations which are necessary to exhibit in a complete course of anatomy. There is, perhaps, no branch of medical science which demands more patient and assiduous toil than this; it was more especially so at that period, when there were few

aids to anatomical knowledge. He communicated his project to Dr. Nicholls, who had declined lecturing in favour of Dr. Lawrence, who gave him little encouragement, and he retired, to await a fit opportunity for commencing his designs. The wished-for opportunity soon occurred. A society of navy surgeons at that time existed, which occupied rooms in Covent Garden, and to this society Mr. Samuel Sharpe had been engaged as a lecturer on the operations of surgery. This course Mr. Sharpe continued to repeat, until finding that it interfered too much with his other engagements, he resigned in favour of William Hunter, who gave his first anatomical course in the winter of 1746. It is said that when he first began to speak in public he experienced much solicitude; but the applause he met with inspired him with that confidence which is so essential an element of all good oratory. Indeed, he gradually became so fond of teaching, that some few years before his death he acknowledged that he was never happier than when engaged in lecturing. The profits of the first two courses were considerable; but having with much generosity contributed to supply the pecuniary wants of his friends, he found himself so reduced on the return of the next season that he was obliged to postpone his lectures, because he had not money to defray the necessary expenses of advertising. An anecdote is mentioned by his biographer, Symmons, very characteristic of the early difficulties which are experienced by many men of genius. Mr. Watson, one of his earliest pupils, accompanied him home after his next introductory lecture. He had just received seventy guineas for admission fees, which he carried in a bag under his cloak, and observed to his friend, "that it was a larger sum than he had ever been master of before." His previous experience now taught him more circumspection—he became more cautious of lending money, and by strict economy amassed that great fortune which he afterwards so liberally devoted to the interests of science. His success as a lecturer before the society of navy surgeons was so decided, that its members requested him to extend his course to anatomy, and gave him the free use of their room for his lectures. This compliment he could not fail to have duly appreciated, and it may be regarded as the precursory sign of that brilliant career which he was soon afterwards destined to pursue.

In the year 1747 he was admitted a member of the Incorporation of Surgeons, and after the close of his lectures in the spring of the following year, he set out with his pupil, Mr. James Douglas, on a tour through Holland and Paris. At Leyden he visited the illustrious Albinus, whose admirable injections inspired him with the zeal to excel in this useful department of anatomy. Having made this tour, he returned to prepare his winter course of lectures, which he commenced at the usual time.

Mr. Hunter at this time practised surgery as well as midwifery; but the former branch of the profession he always disliked. His patron, Dr. Douglas, had acquired considerable reputation as an accoucheur, which probably induced him to direct his views to this line of practice. An additional inducement also presented itself, in the circumstance of his being elected one of the surgeon-accoucheurs to the Middlesex Hospital, and afterwards to the British Lying-in Hospital. The introduction of male practitioners in this department of the profession, according to Astruc, took place on the confinement of Madame la Valliere in 1663. She was anxious for concealment, and called in Julian Clement, an eminent surgeon, who was secretly conducted into the house where she lay, covering her face with a hood,

and where the king is said to have been hidden behind the curtains. He attended her in her subsequent accouchments, and his success soon brought the class of male practitioners into fashion. Nor was this a matter of minor import, for hereby the mortality among lying-in women has been materially reduced. Mowbray is said to have been the first lecturer on obstetrics in London, and he delivered his course of lectures in the year 1725. To him succeeded the Chamberlains, after whom Smellie gave a new air of importance and dignity to the science. It is said that the manners of Smellie were by no means prepossessing—indeed they are described to have been unpleasing and rough; therefore, although a man of superior talent, he necessarily found a difficulty in making his way among the refined and the more polished circles of society. Herein Hunter had a decided advantage, for while he was recognized to be a man of superior abilities, his manners and address were extremely conciliating and engaging. The most lucrative part of the practice of midwifery was at this time divided between Sir Richard Manningham and Dr. Sandys;—the former of whom died, and the latter retired into the country just after Mr. Hunter became known as an accoucheur.

The field was now in a great measure left open to him, and in proportion as his reputation increased he became more extensively consulted. His predecessor, Dr. Sandys, had been formerly professor of anatomy at Cambridge, where he had formed a valuable collection of preparations, which on his death having fallen into the hands of Dr. Bloomfield, was now purchased by Mr. Hunter for the sum of £200. There can be no doubt that the celebrity of Mr. Hunter as an anatomist contributed to increase his practice as an accoucheur, as it was reasonably expected that his minute knowledge of anatomy would give him a correspondingly great command in difficult and dangerous cases. Acting now principally as an accoucheur, he appears to have entirely relinquished the surgical department of his profession; and, desirous of practising as a physician, he obtained in 1750 the degree of Doctor of Medicine from the university of Glasgow. The degree of Doctor of Medicine at that and other universities of Scotland was at this period granted on the candidate's paying a certain sum of money and presenting a certificate from other doctors of medicine of his being qualified to practise the healing art—but so much was the facility of obtaining these degrees abused that this method of granting them has been very properly abolished. Shortly after obtaining his diploma, Dr. Hunter left the family of Mr. Douglas, and went to reside in Jermyn Street, Soho Square.

The following summer he revisited his native country, for which, amidst the professional prosperity of a town life, he continued to entertain a cordial affection. He found on his arrival that his mother was still living at Long Calderwood, which was now become his own property, in consequence of the death of his brother James, who died in the twenty-eighth year of his age. It is worthy of notice that this young man had been a writer to the signet in Edinburgh; but disliking the profession of the law, he went to London, with the intention of studying anatomy under his brother William—so that it would almost appear that in the family of the Hunters there was an hereditary love for medical science. Ill health, however, preyed upon his constitution; so that he could not carry out his plans, and he therefore returned to his birthplace, where he died. At this period Dr. Cullen was progressing to that fame which he subsequently attained; and was resid-

ing at Glasgow, where Dr. Hunter again met him, to take a retrospect over the eventful changes which had signalized the progress of their separate lives. On the return of Dr. Hunter to London he continued corresponding with Dr. Cullen on a variety of interesting scientific subjects, and many of the letters have been published by Dr. Thomson, in his life of this eminent physician, a work which should be familiar to all who take any interest in the history of medical science.

On the resignation of Dr. Layard, who had officiated as one of the physicians to the British Lying-in Hospital, we find the governors of that institution voting their "thanks to Dr. Hunter for the services he had done the hospital, and for his continuance in it as one of the physicians." Accordingly, he was established in this office without the usual form of an election. He was admitted in the following year licentiate of the Royal College of Physicians, and was soon after elected a member of the Medical Society. His history of an aneurism of the aorta appears in the first volume of their *Observations and Inquiries*, published in 1757. In 1762 we find him, in the *Medical Commentaries*, supporting his claim of priority in making numerous anatomical discoveries over that of Dr. Monro secundus, at that time professor of anatomy in the university of Edinburgh. It is not easy to adjust the claims of contemporary discoverers in numerous branches of science; and though, on this occasion, a wordy war of considerable length was waged concerning the real author of the great doctrine of the absorbent action of the lymphatic system, yet the disputants seem to have left the field, each dissatisfied with the conduct of his antagonist, and each equally confident of being entitled to the honour of being regarded as the real discoverer. It is not worth while to rake up the ashes of any such controversy; but it is no more than justice to assert, that Dr. Hunter vindicated his claims in a manly and honourable tone, at the same time acknowledging that "the subject was an unpleasant one, and he was therefore seldom in the humour to take it up."

In 1762, when the queen became pregnant, Dr. William Hunter was consulted, and two years afterwards had the honour to be appointed physician extraordinary to her majesty. We may now regard him as having attained the highest rank in his profession; and from the increase of his practice he selected Mr. Hewson, an industrious and accomplished young man, to be his assistant, and afterwards took him into partnership with him in his lectures. This connection subsisted until the year 1770, when, in consequence of some misunderstanding, it was dissolved, and Cruickshank succeeded to the same situation. In the year 1767 Dr. William Hunter became a fellow of the Royal Society, to which the following year he communicated his observations on the bones, commonly supposed to be elephants' bones, which were found near the river Ohio in America. At this period the attention of men of science had been directed to the large bones, tusks, and teeth, which had been found on the banks of the above river, and the French Academicians came to the conclusion that they were, in all probability, the bones of elephants. From the different character of the jaw-bone, and other anatomical signs, Dr. William Hunter, however, came to the conclusion that they did not belong to the elephant, but to an animal *incognitum*, probably the same as the mammoth of Siberia.¹ Nor was this the only subject of natural history on which Dr. Hunter ex-

¹ *Philosophical Transactions*, vol. lviii.

exercised his ingenuity, for in a subsequent volume of the *Transactions* we find him offering his remarks on some bones found in the Rock of Gibraltar, which he proves to have belonged to some quadruped. Further, we find an account published by him of the nylghau, an Indian animal not before described. Thus, amidst the anxious duties of that department of the profession in which he excelled, we find his active mind leading him into investigations on subjects of natural history, which are eminently interesting to all who delight in examining into the mysteries, and beauties, and past history of the surrounding world.

In the year 1768 Dr. William Hunter became fellow of the Society of Arts, and the same year, at the institution of an Academy of Arts, he was appointed by his majesty professor of anatomy. His talents were now directed into a new sphere of action, in which he engaged with unabated ardour and zeal. He studied the adaptation of the expression of anatomy to sculpture and painting, and his observations are said to have been characterized by much originality and just critical acumen.

In January, 1781, he was unanimously elected successor to Dr. John Fothergill, as president of the Royal College of Physicians of London, the interests of which institution he zealously promoted. In 1780 the Royal Medical Society of Paris elected him one of their foreign associates, and in 1782 he received a similar mark of distinction from the Royal Academy of Sciences in that city. Thus, in tracing the life of this eminent physician, we find honour upon honour conferred upon him, in acknowledgment of the essential services which he rendered to the cause of science. But his *chef d'œuvre* yet remains to be noticed; it was consummated in the invaluable *Anatomy of the Human Gravid Uterus*, one of the most splendid medical works of the age in which he lived. It was commenced in 1751, but not completed until 1775, owing to the author's desire to render it as complete as possible. It contains a series of thirty-four folio plates, from superior drawings of subjects and preparations, executed by the first artists, exhibiting all the principal changes which occur during the nine months of pregnancy. Here we find the first representation that was given of the retroverted uterus, and the membrana decidua reflexa discovered by himself. He did not live, however, to complete the anatomical description of the figures, which his nephew Dr. Baillie did in 1794.¹ He dedicated this valuable work to the king; and it needs only to be added, in testimony of its merit, that notwithstanding the march of medical knowledge, it has not been superseded by any rival author. It remains now, and will go down to posterity, as a standard work, complete in its designs and admirable in its execution. But this was not the only service which Dr. William Hunter rendered to the profession; it remains for us yet to record the circumstances under which he founded a museum which has justly called forth the admiration of every medical man by whom it has been visited. When he began to reap the fruits of his professional skill and exertions, he determined on laying aside a fund from which he would derive support, if overtaken by the calamities of sickness or the infirmities of age. This he very shortly accomplished; and it is said, that on one occasion he stated that, having borrowed from this fund a sum to defray some expenses of his museum, he felt very much dissatisfied and uneasy until it was replaced. His competency

having been obtained, and his wealth continuing to accumulate, he formed a laudable design of founding a school of medicine, and for this purpose addressed a memorial to Mr. Grenville, then minister, in which he requested the grant of a piece of ground in the Mews for the site of an anatomical theatre. He undertook to expend £7000 on the building, and to endow a professorship of anatomy in perpetuity; but the scheme did not meet the reception it deserved, and fell to the ground. It is said that the Earl of Shelburne afterwards, in conversation with the learned doctor, expressed his approbation of the design, and desired his name to be put down as a subscriber for £1000. But Dr. Hunter had now, it would appear, determined on other arrangements, having purchased a spot of ground in Great Windmill Street, which he determined to appropriate to the proposed use. He there built accordingly a house and anatomical theatre, and removed from Jernyn Street to these premises in 1770. Medical men engaged in active practice, who have a taste for the study of morbid anatomy, have little difficulty in obtaining specimens; and by his own exertions and those of his pupils, many of whom engaged zealously in the cause, he soon succeeded in bringing together a vast number of morbid preparations, to augment the number of which he purchased numerous collections that were at various times exposed to sale in London. The taste for collecting, which all acquire who commence founding a museum, "increased by what it fed on," and he now, in addition to the anatomical specimens, sought to accumulate fossils, curious books, coins—in short, whatever might interest either the man of letters, the physician, the naturalist, or the antiquary. We are informed that in respect to books he became possessed of "the most magnificent treasure of Greek and Latin books that has been accumulated since the days of Mead;"—furthermore, Mr. Combe, a learned friend of the doctor's, published a description of part of the coins in the collection, under the following title:—*Nummorum Veterum Populorum et Urbium qui in Museo Gulielmi Hunter asservantur, Descriptio, figuris illustrata*. In the preface to this volume, which is dedicated by Dr. William Hunter to her majesty, some account is given of the progress of the collection, which had been accumulating since 1770, at an expense of upwards of £20,000. In 1781 a valuable addition to it was received, consisting of shells, corals, and other curious subjects of natural history, which had been collected by the late Dr. Fothergill, who gave directions by his will that his collection should be appraised after his death, and that Dr. William Hunter should have the refusal of it at £500. This was accordingly done, and Dr. Hunter purchased it eventually for £1200. To complete the history of this museum, we may here add, that on the death of Dr. William Hunter he bequeathed it, under the direction of trustees, for the use of his nephew Dr. Matthew Baillie, and in case of his death to Mr. Cruickshank, for the term of thirty years, at the expiration of which it was to be transmitted to the university of Glasgow. The sum of £8000 was furthermore left as a fund for the support and augmentation of the collection, and each of the trustees was left £20 per annum for the term of thirty years—that is, during the period that they would be executing the purposes of the will. Before the expiration of the period assigned, Dr. Baillie removed the museum to Glasgow, where it at present is visited by all who take an interest in medical or general science.

We have followed Dr. William Hunter through the chief and most remarkable events by which his life was characterized; and now, pausing to contem-

¹ *Anatomical Description of the Gravid Uterus and its Contents*, 1794.

plate his having arrived at the summit of his ambition—honoured by the esteem of his sovereign, complimented by foreign academies, and consulted by persons of all ranks—with an independence of wealth which left him no desires for further accumulation of riches—we must acknowledge that the cup of human enjoyment, while it mantles to the brim, must still contain some bitter drop—that there is in this world no happiness without alloy. Ill health now preyed upon his constitution, and he seriously made up his mind to retire to his native country, where he might look back upon the vista of his past life and die in peace. With this view he requested his friends Dr. Cullen and Dr. Baillie to look out for a pleasant estate for him, which they did, and fixed on a spot in Annandale, which they recommended him to purchase. The bargain was concluded, but when the title-deeds were examined they were found to be defective—and accordingly the whole project fell to the ground, for although harassed by ill health, Dr. Hunter found that the expenditure to support the museum was so enormous, that he preferred still remaining in his practice. He was at this time dreadfully afflicted with gout; the attacks became more frequent; but on the 20th of March, 1783, he found himself so much recovered, that he determined to give the introductory lecture to the operations of surgery, and it was to no purpose that his friends urged on him the impropriety of the attempt. Accordingly he delivered the lecture, but towards the conclusion his strength became so much exhausted that he fainted, and was obliged to be carried by his servants out of the lecture-room. The night after the delivery of the above lecture, and the following day, his symptoms became aggravated, and on Saturday morning he informed his medical adviser, Mr. Combe, that he had during the night had a paralytic stroke. As neither his speech nor his pulse was affected, and as he was able to raise himself in bed, Mr. Combe was in hopes that his patient was mistaken; but the symptoms that supervened indicated that the nerves which arise in the lumbar region had become paralyzed; for the organs to which they are distributed lost the power of performing their functions. Accordingly he lingered, with the symptoms which in all similar cases exist, until Sunday the 30th March, when he expired. During his last moments he maintained very great fortitude and calmness, and it is reported that shortly before his death he said, turning round to Mr. Combe, "If I had strength enough to hold a pen I would write how easy and pleasant a thing it is to die." During the latter part of his illness his brother John—with whom he had previously been on unfriendly terms—requested permission to attend him, and felt severely the parting scene. His remains were interred on the 5th April, in the rector's vault of St. James' Church, Westminster.

The lives of all eminent men may be viewed in a double relation—they may be contemplated simply with a reference to their professional and public career—or they may be viewed in connection with the character they have displayed in the retired paths of domestic life. It would appear that Dr. Hunter devoted himself exclusively to the pursuits of his profession; nor did he contract any tie of a gentler and more endearing nature to bind him to the world. His habits were temperate and frugal. When he invited friends to dine with him he seldom regaled them with more than two dishes, and he was often heard to say, that "a man who cannot dine on one dish deserves to have no dinner." After the repast the servant handed round a single glass of wine to each of his guests; which trifles show the

economical disposition he possessed, and which enabled him to realize £70,000 for the purpose of completing a museum for the benefit of posterity. He was an early riser, and after his professional visits was to be found always occupied in his museum. He was in person "regularly shaped, but of slender make, and rather below the middle stature." There are several good portraits of him, one of which is an unfinished painting by Toffany, representing him in the act of giving a lecture on the muscles at the Royal Academy, surrounded by a group of Academicians. Another by Sir Joshua Reynolds, and of which a correct and elegant fac-simile is given in connection with the present work, is preserved in the Hunterian Museum at Glasgow.

The professional character of Dr. Hunter is deservedly held high in the estimation of all who are acquainted with the history of medicine. His *Anatomy of the Gravid Uterus* is alone a monument of his ability; but, besides this, he made discoveries for which his name deserves the highest possible respect. His claims to being the discoverer of the origin and use of the lymphatic vessels were, it is true, warmly contested; but many who have taken pains to examine the merits of the controversy, among whom we may mention the celebrated Blumenbach, agree in awarding to him the honour of the discovery. He had the merit also of first describing the varicose aneurism, which he did in the *Observations and Inquiries* published by the Medical Society of London. His discovery and delineation of the *membrana decidua reflexa* in the retroverted uterus, deserves also honourable mention; in short, both the sciences of anatomy and midwifery were materially advanced by his labours. He was a good orator, and an able and clear lecturer; indeed the extent of his knowledge, more especially in physiology, enabled him to throw a charm of interest over the dry details of descriptive anatomy. His general knowledge was, as we have seen, very extensive; and his name and talents were respected in every part of Europe. Among the MSS. which he left behind him, were found the commencement of a work on *Biliary and Urinary Concretions*, and two introductory lectures, one of which contains the history of anatomy from the earliest period down to the time when he wrote; also, considerations on the immediate connection of that science with the practice of physic and surgery. Among other of his works, which are highly esteemed by the profession, we may notice his *Essay on the Origin of the Venereal Disease*, which he communicated to the Royal Society; and also his *Reflections on the Sympthesis Pubis*.

By his will Dr. Hunter bequeathed an annuity of £100 to his sister Mrs. Baillie during her life, and the sum of £2000 to each of her daughters. The residue of his estate and effects went to his nephew.

We may conclude our memoir of this eminent physician by relating the following anecdote, which is said to have occurred in his visit to Scotland before he had acquired the celebrity he so earnestly desired. As he and Dr. Cullen were riding one day in a low part of the country, the latter pointed out to him his native place, Long Calderwood, at a considerable distance, and remarked how conspicuous it appeared. "Well," said he, with some degree of energy, "if I live I shall make it more conspicuous." We need not add any comment on his having lived to verify fully this prediction. Such are the achievements which assiduity and perseverance are ever enabled to accomplish. The moral deducible from the lives of all eminent men teaches the same lesson.

JOHN HUNTER, younger brother of the preceding, was one of the most profound anatomists and

expert surgeons of the age in which he lived. We have already seen how much his brother did to promote the interests of medical science, and we shall find in the sequel that the subject of our present memoir accomplished still more, and attained even to a higher and prouder eminence, inasmuch that his name is, as it were, consecrated in the history of his profession, and respected and esteemed by all who are in the slightest degree acquainted with the science. The exact date of his birth has been a subject of some dispute:—by Sir Everard Home it is placed in July 14, 1728; and this day has been celebrated as its anniversary by the College of Surgeons of London;—Dr. Adams, however, has dated it on the 13th of February, on the authority of the parish register shown to him by the Rev. James French, the minister of the parish. This evidence is sufficiently satisfactory; and we therefore consider that the latter is the correct date of his birth. He was, as we have already stated, the youngest of the family, and born when his father had nearly reached the age of seventy. Being the youngest, he was a great favourite with both of his parents; indeed, they allowed him to enjoy without restraint all the pleasures and pastimes which are the delight of early life, without imposing on him those tasks which are essential to an early and good education. Ten years after his birth his mother was left a widow, and he was then the only son at home, one or both of his sisters being now married. Herein, therefore, we may find every apology for the indulgence of his mother, who doubtless regarded him with an eye of no ordinary interest and affection. He was accordingly not sent to school until he had arrived at the age of seventeen, when he was placed at a grammar-school—but not having the patience to apply himself to the cultivation of languages, and furthermore disliking the restraint to which he was subjected, he neglected his studies, and devoted the greater part of his time to country amusements. About this time John Hunter went to Glasgow on a visit to his sister, for whom he had the greatest affection, to comfort her in her distress, and endeavour to assist in extricating her husband from the difficulties in which he was involved. There is a report that Mr. Hunter was destined to be a carpenter, and one of his biographers ventures to affirm that “a wheel-wright or carpenter he certainly was;” however, the only ground for such a statement seems to have been, that when orders were pressing he occasionally did assist his brother-in-law, by working with him at his trade. The occupation of a carpenter is, in towns distant from the metropolis, often combined with that of a cabinet-maker;—and thence arose the report to which we have just alluded. Soon become tired of witnessing embarrassments he could not relieve, and finding that his sister preferred grieving over her sorrows alone, to allowing him to be the constant witness of her grief, he returned to Long Calderwood, after an absence which had so far had a beneficial effect on him that it weaned him from home, reconciled his mother to his absence, and in all probability suggested to him reflections and motives for future activity, which never otherwise might have occurred. He had often heard of his brother William's success in London, and he now wrote to him requesting permission to pay him a visit, at the same time offering to assist him in his anatomical labours;—and in case these proposals were not accepted, he expressed a wish to go into the army. His brother returned a very kind answer, and gave him an invitation to visit him immediately, which he cheerfully accepted, and in September, 1748, he arrived in London. About a

fortnight before the winter session of lectures for that year, his brother, anxious to form some opinion of his talents for anatomy, gave him an arm to dissect the muscles, with some necessary instructions for his guidance, and the performance, we are informed, greatly exceeded expectation. William now gave him a dissection of a more difficult nature—an arm in which all the arteries were injected, and these as well as the muscles were to be exposed and preserved. His execution of this task gave his brother very great satisfaction, nor did he now hesitate to declare that he would soon become a good anatomist, and furthermore he promised that he should not want for employment. Here we may observe, that the manipulation in dissecting requires a species of tact, which, like many other acquirements, is best obtained in early life; and now under the instruction of his brother and his assistant Mr. Symonds, he had every opportunity for improvement, as all the dissections carried on in London at this time were confined to that school.

In the summer of 1749 the celebrated Cheselden, at the request of Dr. Hunter, permitted John to attend at the Chelsea Hospital, where he had ample opportunities for studying by the sick-bed the progress and modifications of disease. At this time surgical pathology was in a rude state; and, among other absurd doctrines, the progress of ulceration was held to be a solution of the solid parts into pus or matter. When the mind, however young, enters fresh and vigorous into the field of inquiry, untrammelled by early prejudices, it is apt to observe phenomena in new relations, and to discover glimmerings of paths which lead to the knowledge of unsuspected truths. Such at this time we may consider to have been the state of John Hunter's mind—acute in all its perceptions; discriminate in all its observations; and free to embrace fearlessly whatever new theories his reflections might suggest. Here, therefore, in learning the first rudiments of surgery, he first began to suspect the validity of the doctrines which were promulgated, which some few years afterwards it was his good fortune to combat and overthrow.

In the succeeding season Mr. Hunter was so far advanced in the knowledge of practical anatomy as to relieve his brother from the duty of attending in the dissecting-room. This now became the scene of the younger brother's employment during the winter months, whilst William confined himself to delivering lectures in the theatre. In the summer he resumed his attendance at the Chelsea Hospital, and in the following year, 1751, he became a pupil at St. Bartholomew's Hospital, where he was generally present at the performance of the most remarkable operations. At this time Mr. Pott was one of the senior surgeons at the latter institution, and no man operated more expertly, or lectured with better effect, than he did; and although his pathological doctrines were subsequently, and with justice, arraigned by his present pupil, his name is nowhere mentioned by him but with the highest respect.

In the year 1753 Mr. Hunter entered as a gentleman commoner in St. Mary's Hall, Oxford; probably with the view of subsequently becoming a fellow of the College of Physicians. But his matriculation was not afterwards persevered in, and the following year he entered as surgeon's pupil at St. George's Hospital. His object in taking this step, which might at first sight appear to have been unnecessary, is obvious. He desired to obtain the appointment of surgeon to some public hospital; and he well knew, that while his chance of success at Chelsea Hospital was very remote, he was precluded from competing for the appointment at St. Bartholomew's,

from the circumstance of his now having served as an apprenticeship to any surgeon of that hospital, a qualification especially required of every candidate for that office. He accordingly concluded that the chances were more in his favour at St. George's, where he hoped to obtain without interfering among the medical students to learn of his wishes. To this hospital he was at first years afterwards appointed house-surgeon. Thus, we may observe, in a temporary office, the person holding which may be regarded as a resident pupil, who lives in the house, and is expected to be always on readiness to attend to any accident that may be brought to the house, or any case in the vicinity.

In the winter of 1755 he was admitted to a partnership in the business of his brother, a certain portion of the house being allotted to him, and he being required to attend during the absence and absence of his brother. Probably from the neglect of his early education, he was little qualified to compete with his brother as a lecturer, a task he always performed with very great difficulty. In making dissections and anatomical preparations he was surrounded in such a manner as to be of great importance when we remember that this art was at that time very little known, and that such exhibitions were of great utility during the period before Mr. Hunter worked for two years, says Sir Edward Home, "that human anatomy, being then almost perished, he made himself master of what was then known, as well as made some additions to that knowledge." He traced the ramifications of the voluntary nerves upon the musculature of the arm, and discovered the course of some of the branches of the fifth pair of nerves. In the gravid uterus he traced the arteries of the uterus to their termination in the placenta. He was also the first who discovered the existence of the lymphatic vessels in man. The difficulty of unravelling all the complex parts of the human frame induced him to extend his inquiries and extend into the structure of the lower animals, nature having, as Dr. Gualtero St. Hilaire has more recently demonstrated, preserved one type in the organization of all animal beings. He applied to the keeper of the Tower, and the men who are the proprietors of the menageries of wild beasts, for the bones of the animals that died under their care, besides which he purchased such rare animals as came in his way, and many were presented to him by his friends, which he very judiciously committed to the showmen to keep until they died, the better to secure their interest in assisting him in his labours.

Ill health is too often the penalty of unremitting application, and Mr. Hunter's health now became so much impaired, by excessive attention to his pursuits, that in the year 1760, when he had just completed his thirty-second year, he became affected by symptoms which appeared to be intemperate consumption, and for which a medical treatment was deemed advisable.

In October, 1760, he was appointed by Mr. Aclair surgeon on the staff, and the following spring he embarked with the army for Belleisle, leaving Mr. Hewson to assist his brother during his absence. Both in Belleisle and Portugal he served as senior surgeon on the staff until the year 1763, and during this period amassed the materials for his valuable work on gunshot wounds. Nor is this all; taking advantage of the opportunities presented to him, he examined the bodies of many of the recently killed, with the view of tracing the healthy structures of certain parts, as well as the nature of particular secretions. After the peace in 1763 Mr. Hunter returned to England, "which," says one of his biographers, "I have often heard him say he had left

long enough to be satisfied how preferable it is to all other countries."

Mr. Hewson had now supplied the place of Mr. Hunter in superintending dissections and assisting in the anatomical theatre during the space of two years, and it was scarcely to be expected that he would resume his connection with his brother. Here, then, we find Mr. Hunter at the age of thirty-six, with very limited means, and with few friends, settling in London. Scarcely can any situation of greater anxiety be conceived than that of an able and active-minded man sitting down to practise medicine in a city in which he is comparatively a stranger, and which is already supplied with numerous rival practitioners on whom the public has already pronounced a favourable verdict. Such at this time was the position of Mr. Hunter: as one of his biographers simply but emphatically expresses it, "the practice of surgery now and for a long time afterwards afforded no opening for him; Hawkins, Dunderd, Sharp, Foster embraced almost the whole of family practice, whilst Adam and Tomkins carried from him the chief of the practice derived from the army." Disheartening, and indeed gloomy, as these prospects now were, he returned with unabated ardour to his scientific pursuits, and laid the foundation of that eminence which he afterwards attained. Finding the emoluments from his half-pay and private practice insufficient to support him, he resolved to teach practical anatomy and operative surgery. With the pecuniary means which he was thus enabled to raise, he purchased about two miles from London a piece of ground near Dromington, at a place called Earl's Court, and there built a house for the purpose of experiments which he could not carry on successfully in a large town. Here, in the course of his inquiries, he made several important discoveries. He ascertained the changes which animal and vegetable substances undergo in the stomach when acted on by the gastric juice; he also, by feeding animals with madder, which tinges growing bones with a red colour, discovered the principles observable in the growth of bones; and, furthermore, succeeded in explaining the process by which a dead piece is separated from the living bone. During his absence from England his name had in some degree been kept up, before the attention of the public by his brother's essays in the *Medical Commentaries*, where we find several allusions to his experiments and observations. In consequence of these scientific researches, while he was yet as a practitioner overlooked by the public, the Royal Society, much to its honour, elected him a fellow in which title he preceded his brother, who was ten years older, and had been known ten years earlier in the metropolis. The adjudgment of this honour and the recognition of the merits which it necessarily carried along with it, must in Mr. Hunter's circumstances, have been to him peculiarly gratifying. It was a proud incentive to further exertion: and a strong inducement to bear up against the difficulties which, as we have explained, at this time retarded his professional advancement.

The love of science leads us at all times to resources which lie beyond the neglect and injustice of the world, and the mind of Hunter, unencumbered as it was in early life, now sought relief, occupation, and improvement in the pains which it opened up. Among other instructive amusements, he employed himself in watching the peculiar habits and instincts of various animals, for which purpose he kept several, which should have been domesticated in menageries, in his own house. Sir Edward Home relates the following anecdote:—"Two leopards, which were

left chained in an outhouse, had broken from their confinement and got into the yard among some dogs, which they immediately attacked; the howling this produced alarmed the whole neighbourhood. Mr. Hunter ran into the yard to see what was the matter, and found one of them climbing up the wall to make his escape, the other surrounded by the dogs; he immediately laid hold of them both and carried them back to their den. But as soon as they were secured, and he had time to reflect on the risk of his own situation, he was so much agitated that he was in danger of fainting."

This year, by a strong exertion in dancing, Mr. Hunter unfortunately broke the tendo Achillis (the strong and broad tendon felt at the back of the foot), in consequence of which he introduced an improvement on the mode of treating this accident, which was superior to that recommended by Dr. Alexander Munro, who had himself at a more advanced period of life experienced a similar misfortune.

We have no account from Sir Everard Home of Mr. Hunter's town residence, until his brother, having completed his house in Windmill Street, assigned over to him the lease of his house in Jernyn Street. It is presumed by one of his biographers, that on his first arrival in London he lodged in Covent Garden, for the purpose of being near to his brother's dissecting-rooms, and another informs us that on his return from abroad he resided in Golden Square. Be this as it may, he appears to have lived in Jernyn Street until the expiration of the lease in 1783, a period of fifteen years. Whatever may have been the slight difference which existed between him and his brother, the latter appears still to have interested himself in his welfare, as we find that, chiefly through his interest, he was in 1768 (on the authority of Dr. Symmons) elected surgeon to St. George's Hospital. He had now acquired the desired means for giving his talents and industry full scope; for, as fellow of the Royal Society, he gained the earliest notice of every scientific discovery and improvement which might take place in Europe; and as surgeon to this hospital he had the means of extending his observations and confirming his pathological doctrines. His whole time was now devoted to the examination of facts, and the patient accumulation of such knowledge as he could gradually attain; nor did he, as many others have done, captivated by love of fame, rush prematurely before the notice of the public. Herein he showed very considerable wisdom, and well would it have been for many authors had they, like him, persevered even in obscurity in maturing their knowledge before surrendering themselves to a tribunal whose verdict will always in the end be found to have been dictated by the severest and most rigid principles of justice.

The surgeons of most of the public hospitals in this country have the privilege of selecting, on their own terms, house-pupils, who reside with them a year or two after the completion of their education. Among many who became pupils of John Hunter, and afterwards acquired celebrity in their profession, we may notice the famous Dr. Jenner, who boarded in his house in 1770 and 1771, and lived in habits of intimacy with him until his death. "In every conversation," says a friend of Dr. Jenner's, "as well as in a letter I received from him, he spoke with becoming gratitude of his friend and master." Even the slightest recollection, or testimony of esteem, from such a man as Dr. Jenner, in favour or illustration of the character of John Hunter must be received with interest. In 1771 Mr. Hunter published the first part of his *Treatise on the Teeth*, a very valuable work, the merit of which has not been surpassed

by any later production. It may be observed, *en passant*, that this was the only work he sold to the booksellers, all his others being published on his own account, or communicated to miscellaneous collections, chiefly periodicals. Between the appearance of the first and second part of his treatise, Dr. Fothergill published his paper on that painful affection of the facial nerve, denominated *Tic Douloureux*.

While thus rising in eminence, Mr. Hunter became attached to the daughter of Mr. Boyne Home, surgeon of Burgoyne's regiment of light horse, who was also the father of the celebrated Sir Everard Home; but their marriage was necessarily delayed until he had obtained a sufficient competency. His exertions therefore were correspondingly increased; and during this time, when he could suspend his professional and scientific toils, nothing gave him greater gratification than the pleasure of enjoying her society. "The expenses of his pursuits," says Sir Everard Home, "had been so great, that it was not for some years after his first engagement with this lady that his affairs could be sufficiently arranged to admit of his marriage. This happy period at length arrived, and he was married to Miss Home in 1771."

"Whilst he was paying," continues Sir Everard, "his addresses to my sister, I was a boy at Westminster School. During the holidays I came home, and Mr. Hunter, who was frequently there, always showed me particular kindness; he made my father an offer to bring me up to his profession, a proposal which I readily accepted. I was struck with the novelty and extent of his researches, had the highest respect and admiration for his talents, and was ambitious to tread the paths of science under so able a master."

The year after his marriage, at the request of Sir John Pringle, he read to the Royal Society a communication showing that after death the gastric juice has the power of dissolving the coats of the stomach. This paper he was persuaded to read to the society before he had entirely completed the investigations which he further meditated;—but it appears that he did not afterwards return to the subject, considering that the fact on which any further inquiries might be formed had been sufficiently demonstrated.

In the winter of 1773 he formed a plan for giving a course of lectures on the theory and principles of surgery, with the view of vindicating his own principles, which he frequently heard misquoted or ascribed to others, and of teaching them systematically. The first two winters he read his lectures gratis to the pupils of St. George's Hospital, and the winter following charged the usual terms of other teachers in medicine and surgery. "For this, or for continuing them," says one of his biographers, "there could be no pecuniary motive. As he was under the necessity of hiring a room and lecturing by candle light, his emoluments must have been trifling. The lectures not being considered a part of medical education, his class was usually small; and of the few that heard him, the greater part acknowledged their difficulty in understanding him, which was often proved by their incapacity of keeping up their attention. The task itself was so formidable to him, that he was obliged to take thirty drops of laudanum before he entered the theatre at the beginning of each course. Yet he certainly felt great delight in finding himself understood, always waiting at the close of each lecture to answer any questions; and evincing evident satisfaction when those questions were pertinent, and he perceived that his answers were satisfactory and intelligible." In addition to this, Sir Everard Home, after stating the fact of his having recourse to laudanum—the elixir vite of the opium-eater—"to take off the effects of uneasiness," adds, "he trusted

nothing to memory, and made me draw up a short abstract of each lecture, which he read on the following evening, as a recapitulation to connect the subjects in the minds of the students."

Amidst all his avocations, both as a lecturer and practitioner, Dr. John Hunter still pursued with an unabated zeal and industry his researches into comparative anatomy. No opportunity for extending his knowledge on this interesting department of science did he permit to escape him. In the year 1773, at the request of Mr. Walsh, he dissected the torpedo, and laid before the Royal Society an account of its electrical organs. A young elephant which had been presented to the queen by Sir Robert Barker, and had died, afforded him an opportunity of examining the structure of that animal; after which two other elephants in the queen's menagerie likewise died, which he also carefully dissected. The year following, 1774, he published in the *Philosophical Transactions* an account of certain receptacles of air in birds, showing how these communicate with the lungs and are lodged in the fleshy parts and in the bones of these animals; likewise a paper on the gillaroo-trout, commonly called in Ireland the gizzard-trout. In 1775 several animals of the species called the *Gymnotus electricus* of Surinam were brought alive into this country, and by the curious phenomena they exhibited the attention of the scientific world was greatly excited. After making numerous experiments on the living animals, Mr. Walsh purchased those which died, and gave his friend Mr. Hunter an opportunity of examining them. This he readily accepted, and drew up an account of their electrical organs, which he published in the *Philosophical Transactions*. In the same volume of that valuable work will be found his paper containing experiments respecting the powers of animals and vegetables in producing heat. Thus, in the paths of natural history did he find a recreation from the more serious, and often irksome duties of his profession; and by his skilful dissections, and acute observations, enriched our knowledge in this interesting and fascinating department of science.

While thus engaged, Mr. Hunter found a great difficulty in showing to advantage the natural appearances of many parts of animals which he wished to be preserved. In some instances the minute vessels could not be seen when the preparation was immersed in spirits; in others the natural colour of the parts preserved; and even the character of the surface, faded and underwent a change after being some time immersed in this liquid—a circumstance which, to this day, diminishes very much the value of almost all the morbid preparations which are preserved in private and public museums. The only method therefore of accomplishing the object he had in view, was to have them carefully and correctly drawn at the time of the dissection. The expense of engaging draughtsmen, the difficulty of procuring them, and above all their ignorance of the subject to be delineated, were considerable objections to their employment. Accordingly he engaged a young and talented artist named Bell, to live with him for ten years, during which period it was agreed that he should be employed both as a draughtsman and in making anatomical preparations. This young man soon imbibed the spirit of his master; he worked assiduously with his knife, his forceps, and his pencil; he engaged himself during part of his time in copying out Mr. Hunter's lectures, and in less than ten years became a skilful anatomist and surgeon. By his labours Mr. Hunter's collection became enriched with many very accurate and spirited drawings, and a variety of curious and delicate anatomical preparations. This

skilful artist, by the interest of his friend Sir Joseph Bankes, obtained the appointment of assistant-surgeon in the Honourable East India Company for the settlement of Bencoolen in Sumatra, whither he set out with the view both of improving his fortune and collecting specimens of natural history. He was in both successful beyond his most sanguine expectations. He sent home some very rare specimens of animals and corals, and two papers which appeared in the *Philosophical Transactions*—one giving a description of the double-horned rhinoceros, and the other of an uncommonly formed fish. Unfortunately for the cause of science, he died of fever in 1792, being one of the many who have been summoned from this world amidst early promises of future excellence and success.

In January, 1776, Mr. Hunter was appointed surgeon-extraordinary to his majesty—an honour which contributed still farther to advance his professional interests. About this time the attention of the public was much directed to the efforts of the Humane Society. Dr. Cogan was the first who introduced the subject from Holland; and after him Dr. Hawes did not suffer it to rest until it experienced the royal patronage. Here again we find Mr. Hunter zealously engaged in endeavouring to ascertain the best mode of restoring apparently drowned persons, the consequence of which was the production of a paper which he read to the Royal Society, entitled *Proposals for the Recovery of Persons Apparently Drowned*. The able author of this paper draws the distinction between the mere suspension of the functions by which life is supported, and absolute death, which he illustrates by reference to various animals, in whom, under certain conditions, the actions of life are temporarily suspended. It further contains a description of the signs of life and death, which are of vast importance; indeed, notwithstanding the progress that has since been made, both in Germany and Britain, in medical jurisprudence, this paper contains information which has by no means been superseded.

In the autumn of this year Mr. Hunter was taken extremely ill, and the nature of his complaints induced both his friends and himself to apprehend that his life was in imminent danger. However, the anticipated calamity was averted; he rallied, and was restored to his friends and the public, to whom his subsequent services were of such vast importance. When on his sick-bed he reflected on his own worldly affairs, such as he was about to leave them;—he perceived that all his fortune had been expended in his pursuits; that his family had no provision excepting what might arise from the sale of his collection; and he naturally, on this account, suffered much solicitude and anxiety. No sooner did he leave his sick chamber than he commenced arranging his collection, so that it might, in whatever event, command its value, and with this view he began to make a catalogue of the collection; but the delicacy of his health obliged him to desist from his labours, and, persuaded by his friends and relatives, he retired for a time to Bath. During his absence Mr. Everard Home was employed to draw out descriptions of the preparations, leaving blanks for those with which he was unacquainted. His complaints were considerably ameliorated by his residence at Bath; and though he returned to town before he was quite convalescent, he continued to amend, and was soon recovered.

In 1778 he published the second part of his *Treatise on the Teeth*, and also, in the *Philosophical Transactions*, a paper on the heat of animals and vegetables. In 1780 Mr. Hunter laid before the Royal Society an account of a woman who had the small-pox dur-

ing pregnancy, and in whom the disease seems to have been communicated to the fœtus. The following year he was elected fellow of the Royal Society of Sciences and Belles-lettres at Gottenburg. During this period he read before the Royal Society many valuable communications; among which we may notice a paper on the *Organ of Hearing in Fish*, and six Croonian lectures on *Muscular Motion*. In these lectures he collected all the observations that had been made on the muscles, respecting their powers and effects, and the stimuli by which they are excited; and to these he added comparative observations concerning the moving powers of plants; but these lectures were not published in the *Philosophical Transactions*, as they were not considered by the author to be sufficiently complete dissertations.

Sir Everard Home informs us, that in the year 1783 Mr. Hunter was chosen into the Royal Society of Medicine and Royal Academy of Surgery in Paris. In this year, continues the same writer, the lease of his house in Jernyn Street expired, and his collection being now too large to be contained in his dwelling-house, he purchased the lease of a large house on the east side of Leicester Square, and the whole lot of ground extending to Castle Street, in which there was another house. In the middle space between the two houses he erected a building for his collection. Upon this building he expended above three thousand pounds, and, unfortunately for his family, the lease did not extend beyond twenty-four years. . . . "During the execution of this extensive plan I returned to England from Jamaica, where, at the close of the war, I had been appointed staff-surgeon. . . . I found Mr. Hunter now advanced to a considerable practice, and a still greater share of public confidence. His collection had increased with his income. In this he was materially assisted by his friendship with Sir Joseph Banks, who not only allowed him to take any of his own specimens, but procured him every curious animal production in his power, and afterwards divided between him and the British Museum all the specimens of animals he had collected in his voyage round the world. Drawing materials from such ample sources, standing alone in this branch of science, and high in the public estimation, he had so much attention paid to him, that no new animal was brought to this country which was not shown to him; many were given to him, and of those which were for sale he had commonly the refusal; under these circumstances his collection made a progress which would otherwise have been impossible. In April, 1785, his new rooms were completed, and I devoted the whole of the summer to the object of assisting him in moving his preparations, and arranging them in their proper order."¹

The surgical practice of Mr. Hunter now daily increased, and he performed with great skill and judgment numerous operations, which were at that time new in the art of surgery; but whatever may have been the multiplicity of his professional engagements, his mind was still devoted to effecting improvements in medical education; and with this view, assisted by his friend the celebrated Dr. Fordyce, he instituted a medical society called the *Lycæum Medicum Londinense*, the meetings of which were held in his own lecture-rooms, and which acquired no inconsiderable reputation, both from the numbers and character of its members.

In the year 1786, in consequence of the death of Mr. Middleton, Mr. Hunter was appointed deputy

surgeon-general to the army; shortly after which he published his work on the venereal disease, and another entitled *Observations on Certain Parts of the Animal Economy*; both which works rank high in the estimation of the profession. Sir Everard Home mentions the curious fact that he chose to have his works printed and published in his own house, but "finding," he adds, "this measure to bear hard upon the booksellers in a way which had not been explained, and which was not intended, the second editions were sold by Mr. Johnson in St. Paul's Churchyard, and Mr. Nicoll, Pall Mall." In the spring of this year he had another very severe illness, which confined him to bed and rendered him incapable of any kind of business. "In this state," says his biographer, "I was obliged to take upon myself the charge of his patients, as well as of his other affairs; and these were so extensive that my residence in his house became absolutely necessary. His recovery was very slow, and his health received so severe a shock, that he was never afterwards entirely free from complaint or capable of his usual bodily exertion. After his recovery from this illness he was subjected to affections of the heart upon every occasion which agitated his mind. In this infirm state he was unable to attend patients upon sudden calls in the night, or to perform operations without assistance; and for these years I continued to live with him until within a year of his death, and then took a house within a few doors, which, in no respect, detached me from his pursuits, or prevented me from taking a part in his private practice." The uncertainty of the continuance of life under this affection; the mental agitation, and frequent depression with which it is almost invariably attended, render the victims of such generally anxious and unhappy; the canker-worm is felt to be preying within the living frame, and there is no hope of restoration to permanent health. But notwithstanding all this, his energies remained unabated, and he still toiled with his wonted alacrity in the pursuit of knowledge. In the year 1787 he submitted to the Royal Society a paper giving an account of the experiment he had made to determine the effect of extirpating one ovary on the number of the young; also another communication in which he proves the wolf, jackal, and dog to be of the same species; and another on the anatomy of the whale tribe. In return for these labours, having been twelve years a fellow, he received the gold Copleyan medal. In the July of this year he was chosen a member of the American Philosophical Society; and the same year, on account of his continued ill health, he applied to the governors of St. George's Hospital to allow him an assistant-surgeon, to which request they readily acceded; and Sir Everard Home was appointed to the office. In the year 1789 he succeeded Mr. Adair as inspector-general of hospitals and surgeon-general of the army, and about the same time was admitted a member of the Royal College of Surgeons in Ireland.

In the year 1792 Mr. Hunter found that the period which he allotted to lecturing interfered so much with his other avocations, that he gave his materials for the lectures into the hands of Sir Everard Home, who relieved him of this duty. He now therefore began to prepare for the press his *Treatise on the Blood, Inflammation, and Gun-shot Wounds*, the data for which he had been collecting for many years. In his dedication to the king he states that his appointment as surgeon on the staff in the expedition against Belleisle afforded him the opportunities of attending to gun-shot wounds, of seeing the errors and defects in that branch of military surgery, and

¹ *Life of John Hunter*, by Sir Everard Home, prefixed to his *Treatise on the Blood, Inflammation, and Gun-shot Wounds*.

of conveying to remove them. He further adds, that a person is sometimes so influenced by a growth, and confined as to make the observation which forms the basis of that doctrine which has since been extended to much of the theory of the physiology.

But, in the history of the human mind, and in a very ingenious mode of reasoning, he came to the conclusion, maintained by the doctrine, which he held, that the blood as existing in its fluid state is alive, and from its death arose the changes which are observed in that substance as it is dissolved in the body. In the Old Testament we read, "Ye shall eat the blood of no manner of flesh; for the life of the flesh is in the blood" (Lev. xvi. 42). The same doctrine too seems promulgated in the Alcoran—and appears to have been maintained by the celebrated physicians and philosophers of the East. There is no doubt to be doubted that the idea was suggested by John Hunter, in the century, his name has been long and illustrious as it was elicited by the experiments which he himself performed.

This would be an occasion to occupy a separate place to discuss the general merits of this physiological doctrine, but we are not now at liberty to do it. It is suggested by every philosopher, and is supported by many of the most celebrated names of the age, and it is a doctrine which has been above the inanimate objects by which he is surrounded. It is a doctrine which has been the subject of much investigation; but it must be satisfactory to those who are engaged in the study of medicine, to see the evidence which has been on either side adduced, to find that such men as John Hunter and Abernethy recognized the existence of something beyond the mere mechanism of the human frame; that they in their acute reasonings urged the existence of an internal and self-sustaining principle, which modifies the different conditions of matter, and must be therefore superior to its decay.

In the year 1772 Mr. Hunter was elected an honorary member of the Chirurgico-Physical Society of Edinburgh, and likewise connected himself with the Veterinary College, then just projected in London.

The origin of this institution, says Sir Astley Cooper, in his History of the Agricultural Society of which had offered a premium for the best dissertation on the diseases of the horse. Mr. Sergeant Bell was the first to propose it, and the society was so well pleased with his piece, that in a little time after a veterinary college was projected, over which that gentleman should preside. As soon as the proposal was known to Mr. Hunter he eagerly joined it, and he was not only to quadrupeds, but to man, by extending our knowledge of physiology, and more especially of pathology. In order to forward the plan, several gentlemen, the Duke of Bedford at their head, determined to give to the cause of its being never returned. Mr. Hunter was one of the number. It was proposed that he should examine Mr. Sergeant Bell, to which he readily assented. It will easily be conceived by those who are not at all acquainted with the continental pathology of those days, that the examination proved unsatisfactory. Mr. Hunter could not but be disappointed at the result, but this did not at all lessen his zeal in promoting the object of the institution.* Such was the origin of his connection with the London Veterinary College, of which he now became one of the vice-presidents.

In the Transactions of the Society for Improving Medical Knowledge, of which Mr. Hunter was one of the original and most zealous members, he published about this period papers on the "Treatment of Inflamed Veins," and "Intussusception," and on a mode

of conveying food into the stomach in cases of paralysis of the oesophagus. He likewise finished his *Observations on the Economy of Bees*, and presented them to the Royal Society. These observations he finished at Earl's Court, which was his place of retirement from the toils of his profession, but by no means a retreat from those intellectual labours which diversified the whole tenor of his life. "It was there," says Sir Everard Home, "he carried on his experiments on digestion, on exfoliation, on the transplanting of teeth into the combs of cocks, and all his other investigations on the animal economy, as well in health as in disease. The common bee was not alone the subject of his observation, but the wasp, hornet, and the less known kinds of bees were also objects of his attention. It was there he made the series of preparations of the external and internal changes of the silkworm; also a series of the modification of the egg, with a very valuable set of drawings of the whole series. The growth of vegetables was also a favourite subject of inquiry, and one on which he was always engaged making experiments. In the retreat he had dedicated many kinds of animals and birds, and it was to him a favourite amusement in his walks to attend to their actions and to their habits, and to make them familiar with him. The fowls and birds were those to which he was most partial, and he had several of the bull kind from all parts of the world. Among these was a beautiful small bull he had received from the queen, with which he used to wrestle in play, and entertain himself with his exertions at the time of contest. In one of these contests the bull overpowered him and got him down, and had not one of the servants accidentally come by and frightened the animal away, his limbs would probably have cost him his life."[†]

We have thus already traced the life of John Hunter from youth to middle age; from obscurity to eminence; from adversity to prosperity; and it remains for us now to notice those affections of disease which rendered the tenure of his life one of extreme uncertainty. We have already stated that in the spring of 1760 he was confined to bed by a venous disease—an acute attack of gout, which returned the three following springs, but not in the fourth. In the spring of 1773 he became affected with very severe venous symptoms, owing to disease of the heart. His next illness took place in 1774, and this appears to have been occasioned by inflammation in the arteries of the brain, which gave rise to morbid appearances that were recognized after death. After being blind, and subjected to other reducing treatment, he recovered from this severe attack; but his constitution had received a shock which nothing could surmount.

An organic disease lodged within, which every excitement would aggravate, if not lead to death and suddenly fatal consequences. He had no particular illness, however, from the period until 1783; but in the beginning of the month of that year he became attacked with a dreadfully severe spasmodic disease, which, like his similar attacks, was induced by mental anxiety. Nevertheless he rallied, and partially recovered, nor did anything of the kind particularly remarkable occur until the December of 1786, when at the house of a friend he became affected by a total loss of memory. He did not know in what part of the town he was; nor even the name of the street when told it; nor where his own house was, nor had he any recollection of any place existing beyond the room he was in, yet in the midst of all this he was perfectly conscious of the loss of memory. He was sensible

* *Life of John Hunter*, by Sir Everard Home.

of impressions of all kinds from the senses, and therefore looked out of the window, although rather dark, to see if he could be made sensible of the situation of the house; at length this loss of memory gradually went off, and in less than half an hour his memory was perfectly recovered. About a fortnight afterwards, when visiting a patient, an attack, somewhat of a similar nature, recurred. He thus continued to drag on a painful and precarious existence, with the grave every moment threatening to open beneath his feet. At length the fatal event so long anticipated by his friends occurred; it was sudden, and occasioned, as his former fits had been, by mental excitement. "On the 16th October," says Sir Everard Home, "when in his usual state of health, he went to St. George's Hospital, and meeting with something which irritated his mind, and not being perfectly master of the circumstances, he withheld his sentiments; in which state of restraint he went into the next room, and turning round to Dr. Robinson, one of the physicians to the hospital, he gave a deep groan, and dropped down dead." His body was conveyed from the hospital in a sedan chair, and underwent a careful medical examination, by which it appeared that among other morbid changes that had occurred, the arteries both of the heart and brain had undergone ossification. His funeral was attended by a few of his oldest medical friends, and his remains were interred in the vault under the parish church of St. Martin's in the Fields. He expired, it may be added, in his sixty-fifth year, the same age at which his brother Dr. William Hunter died.

The early education of John Hunter had, it is true, been grievously neglected; but this very fact left him at liberty to explore more freely new and untrodden paths, which men shackled by scholastic dogmas seldom have the courage to attempt. He was of no school; he went with an unprejudiced mind to nature, and examined into all her operations with that freedom and independence which can best advance the true interests of philosophy. He read very little. "I have learned," says one of his biographers, "from a gentleman who was very intimate with him, that when he had made a discovery, it was his custom to relate it to Mr. Cruickshank, who frequently informed him that Haller had made the same observation before." He was a man of truly original observation; and distinguished himself as much by the practical application of his knowledge as by the ingenious theories which he adopted. As a surgeon he was a bold but judicious, a quick yet skilful operator; and suggested many improvements in the mode of performing difficult operations. He discovered the method of operating for popliteal aneurism by taking up the femoral artery on the anterior part of the thigh without interfering with the tumour in the ham, by which the pain, and danger, and future sufferings of the patient are materially mitigated. This indeed ranks among the most important of the improvements which have been introduced into the practice of surgery. It may be added, that John Hunter always held the showy part of surgery in the lowest estimation. "To perform an operation," said he, "is to mutilate a patient whom we are unable to cure; it should therefore be considered as an acknowledgment of the imperfection of our art."

We have adverted to the difficulties which this eminent surgeon experienced for some years in struggling against pecuniary adversities. During the first eleven years of his practice, which, it must be admitted, was for him a long and tedious mental probation, his income never amounted to a thousand pounds a year; however, the four succeeding years

it exceeded that sum: and for several years previous to his death it increased to five, and was at that period six thousand pounds a year. Whatever difficulties therefore at first beset his progress were eventually surmounted; he attained the highest rank in his profession; he was universally esteemed and lauded as a man of general science; he had as much practice as he could attend to; his emoluments were considerable; and if we raise up the curtain of domestic life, we shall find him cheered by the society of a wife whom he loved; besides all which, he was the parent of two children, in whom it was natural that his best hopes and warmest affections should be centered. But the cup of human enjoyment seldom mantles to the brim without containing some drops of alloying bitterness; and there is no doubt but that professional anxieties and ill health rendered his temper irritable and impetuous. He was, says Sir Everard Home, readily provoked, and when irritated not easily soothed. His disposition was candid and free from reserve, even to a fault. He hated deceit, and as he was above every kind of artifice, he detested it in others, and too openly avowed his sentiments. His mind was uncommonly active; it was naturally formed for investigation, and that turn displayed itself on the most trivial occasions, and always with mathematical exactness. What is curious, it fatigued him to be long in mixed company which did not admit of connected conversation, more particularly during the last ten years of his life. He required less relaxation than other men; seldom sleeping more than four hours in the night, but almost always nearly an hour after dinner; this probably arose from the natural turn of his mind being so much adapted to his own occupations, that they were in reality his amusements, and therefore did not fatigue.

We have already seen how much time, even amidst his arduous professional toils and miscellaneous pursuits, he devoted to comparative anatomy, and in collecting preparations to illustrate every department of that interesting science. The museum which he succeeded in founding remains to this day a monument of his industry, perseverance, and ingenuity. Here we find arranged, in a regular order of progressive classification, every species of animate being, or link in the chain of organization, from the lowest vegetable, in which life can be scarcely recognized, up to man; but no account or description, however minute, can do adequate justice to such a collection. By his will he left it, under the discretion of his executors, to be sold for the benefit of his family, in one entire lot, to the government of Great Britain; or in case of refusal, to any other government or state which would offer such a price for it as all parties might consider reasonable. Six years after his death it was purchased by the British parliament for £15,000, and given to the College of Surgeons, on condition that twenty-four lectures should be delivered annually to members of the college, and that under certain regulations it should be open to the public. We thus find that, while his elder brother completed a museum which does honour to the university in which it is preserved, the younger, by his industry and perseverance, completed another, which has been pronounced by the most competent judges to be an honour to his country.

In personal appearance John Hunter was much below the ordinary middle stature; but his body was well formed for muscular exertion, and when in health he was always extremely active. His countenance was open, and although impressed with lines of thought, was by no means habitually severe; on the contrary, its expression soon softened into

tenderness, or became lighted up by mirth, according as the impression swept across his mind. When Lavater saw his print, he said, "That man thinks for himself," an opinion which the whole tenor of his actions will be seen to have verified. He was quick in manner, and "in conversation," says Sir Everard Home, "spoke too freely and harshly of his contemporaries;" but this, we are given to understand, arose rather from his conviction that surgery was still in its infancy, than from any uncharitable motive, or wish to depreciate his contemporaries. Few men were more generous than John Hunter, and the only fault which can impugn his memory is, that in executing his designs for the benefit of science, he neglected too much the interests of his wife and children. On the death of her husband Mrs. John Hunter withdrew from society, and spent her life almost entirely in retirement. After a lingering illness, which she bore with much patience and resignation, she died on 7th January, 1821, in the seventy-ninth year of her age, leaving behind her a son and daughter, the former a major in the army, and the latter the widow of General Campbell, son of Sir James Campbell of Inverneil.

Besides her many amiable domestic qualifications, to which all who knew her bore testimony, she was exceedingly accomplished; and occasionally, during her husband's lifetime, mingled in society with Horace Walpole, Mrs. Carter, Mrs. Vesey, and other characters well known in the literary world. She sang and played with admirable taste, and had a talent for poetry, which she chiefly displayed in the production of songs and poems, which were characterized by much refinement of thought, sensibility of feeling, and delicacy of expression. Among the former, the *Song of Ananias and Sapphira* became extremely popular; among the latter, her verses *On November 1784*, a beautiful address to fancy under the title of *La Douce Chimere*, with several other minor poems, display much feeling and imagination.¹

HUTTON, DR. JAMES, an eminent philosophical character, was born in Edinburgh on the 3d June, 1726. His father was a respectable merchant, who for many years held the office of city-treasurer, and was admired by all who knew him for his sound judgment and strict integrity. He died while James was very young; the care, therefore, of her son devolved upon Mrs. Hutton, whose great maternal kindness was only exceeded by her desire to give him a liberal education. She sent him first to the high-school of Edinburgh, and afterwards to the university, where he entered as a student of humanity in 1740. Professor M'Laurin was then the most celebrated teacher in that seminary, but though Dr. Hutton admired his lectures, he did not seem much disposed towards the science which he taught. To Professor Stevenson's prelections on logic may be attributed the first direction given to young Hutton's genius, not so much for having made him a logician, but for having accidentally directed his mind towards the science of chemistry. The professor having casually mentioned in one of his lectures, in illustration of some general doctrine, the fact that gold is dissolved in *aqua regia*, and that two acids, which can each of them singly dissolve any baser metals, must unite their strength before they can attack the most precious; the phenomenon struck so forcibly on the mind of Hutton, that he began to search with avidity after books which might explain its cause, and afford him an opportunity of pursuing

a study altogether new. He at first found some embarrassments in his pursuit from the superficial works that came to his hands, and it was from Harris' *Lexicon Techni* that he first derived his knowledge of chemistry, and which by a sort of electric attraction drew his mind all at once to a favourite study, that decided his prospects in life.

Though he pursued his academical studies with closeness and regularity, and evinced a taste and capacity for instruction, his friends did not see much profit likely to arise from scientific pursuits, and accordingly persuaded him to adopt some profession, which, though much against his inclination, he agreed to, and was accordingly placed as an apprentice with Mr. George Chalmers, writer to the signet, in 1743. The dry routine of a laborious profession in a less ardent mind might have checked, if not for ever destroyed, those seeds of genius which were as yet scarce called into life; but so strong was Mr. Hutton's propensity for scientific study, that, instead of copying papers, and making himself acquainted with legal proceedings, he was oftener found amusing himself with his fellow-apprentices in chemical experiments; so that Mr. Chalmers was forced to acknowledge that the business of a writer was one in which he had little chance to succeed. With a fatherly kindness he therefore advised young Hutton to embrace some other employment more suitable to his inclinations, and relieved him at once from the obligations he came under as his apprentice. How much is science indebted to that liberal-minded man! Having now to fix upon another profession, he selected that of medicine, as being the most nearly allied to chemistry, and began to study under Dr. George Young, and at the same time attended the lectures at the university from 1744 to 1747. The schools of medicine in Edinburgh at that time had not arrived at the high perfection for which they are now so justly celebrated, and it was thought indispensably necessary that a physician should finish his education on the Continent. Mr. Hutton accordingly proceeded to Paris, where he applied himself closely to anatomy and chemistry. After remaining for two years in France, he returned home by the way of the Low Countries, and took the degree of Doctor of Medicine at Leyden in 1749.

On arriving in London, about the end of that year, he began seriously to reflect upon his prospects in life, and soon saw, that however much he wished to establish himself in his native city as a physician, there were many obstacles which seemed insurmountable. He was a young man whose merit was unknown, and whose connections, though respectable, had no power to assist him, the business being then in the hands of a few eminent practitioners who had been long known and established. All this seems to have made a deep impression on his mind, and he expressed himself with much anxiety on the subject in corresponding with his friends in Edinburgh. Amongst these there was one, a young man nearly of his own age, whose habits and pursuits were congenial to his own, and with whom he had tried many novel experiments in chæiistry; amongst the best was one on the nature and properties of sal-ammoniac. This friend, whose name was James Davie, had, in Mr. Hutton's absence, pushed his inquiries on the subject to a considerable extent; the result of which afforded him a well-grounded hope of being able to establish a profitable manufactory of that salt from coal-soot. Mr. Davie communicated the project to his friend in London, who, with a mind as yet undecided on any fixed pursuit, returned to Edinburgh in 1750, and abandoning entirely his views on the practice of medicine, resolved to apply

¹ She collected her poems and songs, and published them in a small volume in the year 1788.

himself to agriculture. What his motives were for taking this step it is difficult to ascertain. His father had left him a small property in Berwickshire, and being of an independent and unambitious mind, he most probably looked upon the business of a farmer as entitled to a preference above any other. But not being disposed to do anything in a superficial way, he determined to gain a knowledge of rural economy in the best school of the day. For this purpose he went into Norfolk and took up his residence in the house of a farmer, from whom he expected to receive sufficient instruction. He appears to have enjoyed his situation very much—the natural simplicity of his disposition according well with the plain blunt characters around him.

It has been remarked of Dr. Hutton, that to men of an ordinary grade of mind he appeared to be an ordinary man possessing little more spirit perhaps than is usually to be met with. This circumstance made his residence in Norfolk quite agreeable, as even there he could for a time forget his great acquirements, and mingle with the simple characters around him in so cordial a manner, as to make them see nothing in the stranger to set them at a distance from him, or induce them to treat him with reserve. In years after, when surrounded by his literary friends, the philosopher loved to describe the happy hours he spent while under the humble roof of honest John Dybold, from whom he had learned so many good practical lessons in husbandry. From his residence in Norfolk he made many journeys on foot through other parts of England to obtain information in agriculture, and it was in the course of these rambles that, to amuse himself on the road, he first began to study mineralogy and geology. In a letter to Sir John Hall of Douglas, a gentleman possessed of much taste for science, he says, while on his perambulations, "that he was become very fond of studying the surface of the earth, and was looking with anxious curiosity into every pit, or ditch, or bed of a river, that fell in his way, and that if he did not always avoid the fate of *Thales*, his misfortune was certainly not owing to the same cause." This letter was written from Yarmouth in 1753. With the view of still further increasing his knowledge of agriculture, he set out for Flanders, where good husbandry was well understood long before it was introduced into Britain, and travelling through Holland, Brabant, Flanders, and Picardy, he returned about the middle of summer, 1754. Notwithstanding all he had seen to admire in the garden-culture that prevailed in Holland, and the husbandry in Flanders, he says, in a letter to his friend Sir John Hall, from London, "Had I a doubt of it before I set out, I should have returned fully convinced that they are good husbandmen in Norfolk." Many observations made on that journey, particularly on mineralogy, are to be found in his *Theory of the Earth*. As he was now sufficiently initiated in a knowledge of agriculture, he wished to apply himself to the practice in his own country; and for that purpose returned to Scotland at the end of summer. He at first hesitated on the choice of a situation where he might best carry his improved plans of farming into effect, and at last fixed upon his own patrimony in Berwickshire. From Norfolk he brought with him a plough and ploughman, who set the first example of good tillage. It was a novel sight for the surrounding farmers to see the plough drawn by two horses, without an accompanying driver. The new system was, however, found to succeed in all its parts, and was quickly adopted, so that Dr. Hutton has the credit of introducing the new husbandry into a country where it has, since

his time, made more rapid improvements than in any other in Europe. He resided on his farm until the year 1768, occasionally making a tour into the Highlands, with his friend Sir George Clerk, upon geological inquiries, as he was now studying that branch of science with unceasing attention.

While residing on his farm for the last fourteen years, he was also engaged in the sal-ammoniac work, which had been actually established on the foundation of the experiments already made by his friend and himself, but the business remained in Mr. Davie's name only till 1765, when a copartnership was regularly entered into, and the manufactory carried on in the name of both.

As his farm, from excellent management, progressively improved, it became a more easy task, and to a mind like his, less interesting; so that, finding a good opportunity of letting it to advantage, he did so, and became a resident in Edinburgh in the year 1768, from which time he devoted his whole life to scientific pursuits. This change of residence was accompanied with many advantages he seldom enjoyed before;—having the entire command of his own time, he was enabled to mix in a society of friends whose minds were congenial with his own; among whom were Sir George Clerk, his brother Mr. Clerk of Eldin, Dr. Black, Mr. Russel (professor of natural philosophy), Professor Adam Ferguson, Dr. James Lind, and others. Surrounded by so many eminent characters, by all of whom he was beloved and respected, from the vast fund of information he possessed, he employed his time in maturing his views and searching into the secrets of nature with unwearied zeal. In one of these experiments he discovered that mineral alkali is contained in zeolite. On boiling the gelatinous substance obtained from combining that fossil with muriatic acid, he found that after evaporation the salt was formed. Dr. Playfair thinks this to be the first instance of an alkali being discovered in a stony body. The experiments of M. Klaproth and Dr. Kennedy have confirmed the conclusion, and led to others of the same kind. With a view of completing his *Theory of the Earth*, he made many journeys into different parts of England and Wales; and on visiting the salt-mines of Cheshire, he made the curious observations of the concentric circles marked on the roofs of these mines, to which he has referred in his *Theory*, as affording a proof that the salt-rock was not formed from mere aqueous deposition.

In 1777 Dr. Hutton's first publication was given to the world in the shape of a pamphlet on the *Nature, Quality, and Distinctions of Coal and Culm*. This was occasioned by a question which the Board of Customs and privy-council wished to have settled, in order to fix on the proportion of duty the one should bear with the other when carried coastwise. Dr. Hutton's pamphlet was considered so ingenious and satisfactory, that an exemption of the small coal of Scotland from paying duty on such short voyages was the consequence. He took a lively interest in promoting the arts of his native country, and devoted much of his time and attention to the project of an internal navigation between the Firths of Forth and Clyde. He read several papers in the Philosophical Society before its incorporation with the Royal Society (none of which were then published, with the exception of one in the second volume of the *Transactions of the Royal Society*, on "Certain Natural Appearances of the Ground on the Hill of Arthur's Seat"). His zeal for the support of science in Edinburgh induced him to come forward and communicate to the Royal Society a sketch of a *Theory of the Earth*, the perfecting of which had occupied his

constant attention for a period of thirty years, during which time he had never ceased to study the natural history of the globe, with a view of ascertaining all the changes that have taken place on its surface, and discovering the causes by which they have been produced; and from his great skill as a mineralogist, and having examined the great leading facts of geology with his own eyes, and carefully studied every learned work on the natural history of the earth, it must be acknowledged that few men could enter better prepared on so arduous a task. As this *Theory* is so well known, and has been the subject of so much controversy, our limits will not permit us to enter upon it here; we therefore refer our readers to the book itself.

Dr. Kirwan of Dublin, and others, considered Dr. Hutton's *Theory* both eccentric and paradoxical, and charged him with presumption in speculating on subjects to which the mere human understanding is incompetent to reach, while some gave a preference to the system of Berkeley as more simple and philosophical; but notwithstanding all the attacks upon the new doctrines of Hutton, he had the proud satisfaction of being fortified in his opinions by many great and good men, who were bound to him by the closest ties of friendship. Dr. Black, Mr. Clerk of Eldin, and Professor Playfair, as occasion required, were willing and ready to vindicate his hypothesis. But setting aside all these considerations, there existed in the work itself many faults, which contributed not a little to prevent Dr. Hutton's system from making a due impression. In the opinion of his greatest defender, Professor Playfair, "it was proposed too briefly, and with too little detail of facts, for a system which involved so much that was new and opposite to the opinions generally received. The description which it contains of the phenomena of geology suppose in the reader too great a knowledge of the things described. The reasoning is sometimes embarrassed by the care taken to render it strictly logical, and the transitions from the author's peculiar notions of arrangement are often unexpected and abrupt. These defects run more or less through all Dr. Hutton's writings, and produce a degree of obscurity astonishing to all who knew him, and who heard him every day converse with no less clearness and precision than animation and force." In the same volume of the *Transactions* appeared a paper by him, "A Theory of Rain," which he afterwards published in his *Physical Dissertations*. Having long studied meteorology with great attention, this ingenious theory attracted almost immediate notice, and was valued for affording a distinct notion of the manner in which cold acts in causing a precipitation of humidity. It met, however, from M. De Luc with a vigorous and determined opposition; Dr. Hutton defended it with some warmth, and the controversy was carried on with much sharpness on both sides.

In his observations in meteorology he is said to be the first who thought of ascertaining the medium temperature of any climate by the temperature of its springs. With this view he made a great number of observations in different parts of Great Britain, and found, by a singular enough coincidence between two arbitrary measures quite independent of each other, that the temperature of springs along the east coast of this island varies a degree of Fahrenheit's thermometer for a degree of latitude. This rate of change, though it cannot be general over the whole globe, is probably not far from the truth for all the northern parts of the temperate zone. In explaining the diminution of temperature, as we ascend in the atmosphere, Dr. Hutton was much more fortunate

than any other of the philosophers who have considered the same subject. It is well known that the condensation of air converts part of the latent into sensible heat, and that the rarefaction of air converts part of the sensible into latent heat; this is evident from the experiment of the air-gun, and from many others. If, therefore, we suppose a given quantity of air to be suddenly transported from the surface to any height above, it will expand on account of the diminution of pressure, and a part of its heat becoming latent, it will be rendered colder than before. Thus also, when a quantity of heat ascends by any means whatever from one stratum of air to a superior stratum, a part of it becomes latent, so that an equilibrium of heat can never be established among the strata; but those which are less must always remain colder than those which are more compressed. This was Dr. Hutton's explanation, and it contains no hypothetical principle whatsoever. After those publications already mentioned had appeared, he resolved to undertake journeys into different parts of Scotland, in order to ascertain whether that conjunction of granite and schistus, which his theory supposed, actually took place. His views were first turned towards the Grampians, which the Duke of Athol learning, invited him to accompany him during the shooting season into Glen Tilt, a tract of country situated under these mountains. On arriving there he discovered in the bed of the river Tilt, which runs through that glen, many veins of red granite traversing the black micaceous schistus, and producing by a contrast of colour an effect that might be striking even to an unskilful observer. So vivid were the emotions he displayed at this spectacle, that his conductors never doubted his having discovered a vein of gold or silver. Dr. Hutton has described the appearances at that spot in the third volume of the *Edinburgh Transactions* (p. 79), and some excellent drawings of the glen were made by Mr. Clerk, whose pencil was not less valuable in the sciences than in the arts.

He pursued his observations with unabated ardour, and in the two next years, with his friend Mr. Clerk, made several excursions into Galloway, the island of Arran, and the neighbourhood of Jedburgh. In all of these he discovered the same conjunction, though not in so complete a manner as among the Grampians. In 1788 he made some other valuable observations of the same kind. The ridge of the Lammormoor Hills in the south of Scotland consists of the silurian or graywacke formation (then named *primary* by Hutton, but afterwards found to belong to the transition series), which extends from St. Abb's Head south-westward to Portpatrick and into the north of Ireland. The sea-coast at Eyemouth and St. Abb's Head exhibits striking sections of these rocks, which there appear contorted and dislocated in a remarkable manner. The junction of the graywacke with the secondary strata was an object of instructive interest to Hutton. In the same year he accompanied the Duke of Athol to the Isle of Man, with the view of making a survey of that island. He found the main body of the island to consist of what he termed primitive schistus (graywacke), much inclined, and more intersected with quartzose veins than the corresponding rocks in the south and south-east of Scotland. The direction of these strata corresponded with that of the graywacke rocks in Galloway, running nearly from east to west. This is all the general information he obtained from that excursion. It was reserved for later geological researches to determine the true nature and relations of the silurian or graywacke series, by means of the fossils which they have been found to contain. It

was not till after Hutton's day that geologists became palæontological.

Notwithstanding his assiduous attention to geology, Dr. Hutton found leisure to speculate on subjects of a different nature. A voluminous work from his pen made its appearance soon after the *Physical Dissertations:—An Investigation of the Principles of Knowledge, and the Progress of Reason, from Sense to Science and Philosophy*, in three volumes quarto. In this treatise he formed a general system of physics and metaphysics. His opinions on the former subjects were very singular. He deprives matter of those qualities which are usually deemed most essential—solidity, impenetrability, and the vis inertie. He conceived it to be merely an assemblage of powers acting variously upon each other, and that external things are no more like the perceptions they give, than wine is similar to intoxication, or opium to the delirium it produces. It would be vain in us to attempt to analyze this singular work, which cannot fail to recall to the mind the opinions of the ingenious Dr. Berkeley; the two systems agree in many material points, but they differ essentially in others.

In deference to the opinions of so great a man as Dr. Hutton, we shall inform our readers of the view taken of the moral tendency of his work by his friend Professor Playfair, who no doubt scrutinized very deeply its metaphysical speculations, as he in part, if not altogether, became a convert of the Huttonian system. "Indeed," says he, "Mr. Hutton has taken great pains to deduce from his system, in a singular manner, the leading doctrines of morality and natural religion, having dedicated the third volume of his book almost wholly to that object. It is worthy to remark, that while he is thus employed, his style assumes a better tone and a much greater degree of perspicuity than it usually possesses. Many instances might be pointed out where the warmth of its benevolent and moral feelings bursts through the clouds that so often veil from us the clearest ideas of his understanding. One in particular deserves notice, in which he treats of the importance of the female character to society in a state of high civilization. A felicity of expression and a flow of natural eloquence, inspired by so interesting a subject, make us regret that his pen did not more frequently do justice to his thoughts." Dr. Hutton was seized with a severe and dangerous illness in the summer of 1793, and, although before this time he had enjoyed a long continuance of good health, such was the painful nature of his complaint that he was reduced to great weakness, and confined to his room for many months, where, on his regaining some degree of strength, he amused himself in superintending the publication of the work just mentioned. During his recovery he was roused from his quiet into further exertion by a severe attack made on his *Theory of the Earth*, by Dr. Kirwan, in the *Memoirs of the Irish Academy*, rendered formidable by the celebrity of the author. Before this period Dr. Hutton had often been urged to publish the entire work on the *Theory of the Earth*, which he had constantly put off—so much so, that there seemed some danger of its not appearing in his lifetime. The very day, however, after Kirwan's paper was put in his hands, he began the revision of his manuscript, and resolved immediately to send it to press. The work was accordingly published in two volumes octavo, in 1795. He next turned his attention to a work on husbandry, on which he had written a great deal, the fruit both of his vast reading and practical experience. He proposed to reduce the whole into a systematic form, under the title of *Elements of Agri-*

culture. The time, however, was fast approaching which was to terminate the exertions of a mind of such singular activity and ardour in the pursuit of knowledge. In the course of the winter, 1796, he became gradually weaker, and extremely emaciated from the pain he suffered from a recurrence of his former complaint, though he still retained the full activity and acuteness of his mind. Saussure's *Voyages aux Alps*, which had just reached him that winter, was the last study of one eminent geologist, as they were the last work of another. On Saturday the 26th March, 1797, although in great pain, he employed himself in writing and noting down his remarks on some attempts which were then making towards a new mineralogical nomenclature. In the evening he was seized with shivering fits, and as these continued to increase, he sent for his friend Dr. Russel. Before he could arrive all assistance was in vain. Dr. Hutton had just strength left to stretch out his hand to the physician, and immediately expired.

Dr. Hutton was possessed of an uncommon activity and ardour of mind, upheld in science by whatever was new, beautiful, or sublime; and that those feelings operated with more intense power in early life may account for the want of stability he displayed, and the difficulty he felt in settling down to any one fixed pursuit. Geology and mineralogy were to him two of the most sublime branches of physical science. The novelty and grandeur offered by the study to the imagination, the simple and uniform order given to the whole natural history of the earth, and above all, the views opened of the wisdom that governs the universe, are things to which hardly any mind could be insensible, but to him they were matters, not of transient delight, but of solid and permanent happiness.

He studied with an indefatigable perseverance, and allowed no professional, and rarely any domestic, arrangement to interrupt his uniform course. He dined early, almost always at home, ate sparingly, and drank no wine. The evening he spent in the society of friends, who were always delighted and instructed by his animated conversation, which, whether serious or gay, was replete with ingenious and original observation. When he sought relaxation from the studies of the day, and joined the evening party, a bright glow of cheerfulness spread itself over every countenance; and the philosopher who had just descended from the sublimest speculations in metaphysics, or risen from the deepest research in geology, seated himself at the tea-table, as much disengaged from thought, and as cheerful and joyous, as the youngest of the company.

Professor Stewart, in his life of Mr. Smith, has alluded to a little society that then flourished in Edinburgh, called the Oyster Club. Of this, Dr. Black, Dr. Hutton, and Mr. Smith were the founders. When time and opportunity admitted, these distinguished men could unbend one to the other, and on such occasions Dr. Hutton delighted in blending the witty and ludicrous in his conversation. Round them soon formed a circle of choice spirits, who knew how to value their familiar and social converse; and it would be in vain to look for a company more sincerely united, where everything favourable to good society was more perfectly cultivated, and everything opposite more strictly excluded.

Dr. Hutton was never married, but lived with his sisters, three amiable women, who managed his domestic affairs. Though he cared little for money, he had accumulated considerable wealth, owing to his moderation and unassuming manner of life, as well as from the great ability with which his long-

tried friend, Mr. Davie, conducted their joint concern. Miss Isabella Hutton remained to lament her brother's loss, and by her his collection of fossils was given to Dr. Black, who presented them to the Royal

Society of Edinburgh, under the condition that they should be completely arranged, and kept for ever apart, for the purpose of illustrating the Huttonian theory of the earth.

I.

INGLIS, HENRY DAVID. This is one of a class of authors, unfortunately too numerous, who have failed in winning that literary reputation which their labours justly merited. How often it happens that, amidst a mass of neglected books ready to be sold by the pound as waste paper, some stray volume is picked up, which, on being opened, is found to contain an amount of learning, genius, and talent such as would entitle its writer to a respectable place in the authorship of the present day! But who was he? No one can tell; for either his name has been slightly recorded, or allowed to pass away without notice. Among these victims of the world's unjust neglect we fear that David Henry Inglis has already been enrolled.

He was born in Edinburgh in 1795. He was the only son of a barrister, who belonged to an ancient Scottish family: his maternal grandmother was daughter of Colonel Gardiner, who fell so nobly at Prestonpans. This lady was also the authoress of a heroic poem, which, even though written by a hero's daughter, has ceased to be remembered. Through this ancestress Henry David Inglis was allied to the Earl of Buchan and the Erskines. Being intended for the mercantile profession, he passed from the college to the counting-house; but after devoting himself for a short time to business, he found that his affections lay elsewhere; the distinctions of literature, rather than the profits of mercantile speculation, were the objects of his aspirations. He was also anxious to visit foreign countries, and contemplate the scenes of great past events and stirring living incidents, instead of being chained to the desk, and confined to the chapter of profit and loss. He therefore early became a traveller and a writer of travels. His first work of this nature was entitled *Tales of the Ardennes*, which he published under the assumed name of Derwent Conway; and this work was so favourably received by the public on its first appearance, that he was encouraged to continue in the same strain. His next production was *Solitary Walks through many Lands*—a work of still higher talent than the preceding, and possessing passages and descriptions of great beauty, originality, and power. This was followed by *Travels in Norway and Sweden*, and his *Tour through Switzerland, France, and the Pyrenees*, both of which works appeared in *Constable's Miscellany*. While these volumes were publishing, Inglis was employed as editor of a newspaper at Chesterfield; but the same impatience and yearning for travel that made him abandon the stool of the counting-house soon drove him from the editorial chair to resume his beloved life of wandering. He again started for the Continent, and visited the Tyrol and Spain; and on returning home he published two works containing an account of his travels and observations in these countries. Of these volumes, his *Spain* in 1830 was the most successful, and with justice, in consequence of the great amount of interesting information with which it was stored about that land of changes and disasters. After his return from Spain Mr. Inglis again became editor of a

newspaper, and, of all places in the world, the little island of Jersey was the locality in which he was fixed. A permanent stay in such a place was the last thing to be anticipated of such a man; and he had not therefore been long in Jersey when he girded up his loins for fresh rambles and adventure. But whither was he now to wing his course, after he had pretty well exhausted the wide field of Europe? Luckily, a country quite at hand, even Ireland, had not as yet been the subject of his explorations, and thither accordingly his flight was directed. And that his tour was a useful one was well attested by his *Ireland* in 1834. While the extensive information and impartial spirit of this work obtained for it a favourable reception from all parties, the correctness of his views on the condition of the country made it be frequently quoted in the House of Commons during the important parliamentary debates about Ireland in 1835. It is seldom that the soundness and accuracy of an Irish tourist are stamped with such a high attestation.

Hitherto, as we have shown, the literary labours of Inglis had been well appreciated by the public; but still this was not enough. As all the world is travelling everywhere, the individuality of each aspiring pilgrim, let him go where he will, is lost in a crowd; and let him write what marvels he may "of the Alps and Appennines, the Pyrenean and the river Po," and "of the cannibals that each other eat, the Anthropophagi," there are others who behold them as well as himself, and are taking notes of them, to put them in a book. And thus his narrative, however ably written or full of interest, lasts only for to-day; for to-morrow a fresh tourist issues from the press, while the latest intelligence will be always accounted the best. It was thus that Inglis seems to have felt when he found himself ousted successively from every country in which he had roamed so diligently, and about which he had written so well. Literary distinction was not to be won by travelling. Already he had written of what many have seen; but now let him tell what no man ever saw—let him create a world for himself, and fill it with the creatures and deeds of his own imagining. It was toward this department of fiction also that, amidst all his wanderings and authorship, his intellectual longings had been the most directed. His resolution was formed; his choice of a subject was fixed; and after the success of his work entitled *Spain* in 1830, he produced his novel of *The New Gil Blas*, in which he endeavoured to embody Spanish life as it exists in the present day. It was the best of all his writings, for it combined truthful delineation with the highest efforts of fancy and creative power; and while he brought to it all the resources of his genius, and all the affections of his heart, he seems to have regarded it as the great effort by which, like Sir Walter Scott, he would open for himself a new world of distinction and success after the old had been exhausted. But, alas for the unlucky title! Many thought that the first *Gil Blas* was enough, and would not read the second; many opened it, and then threw it aside,

mistaking it for a mere paltry imitation; while the few who dared to read on were troubled with thoughts of Le Sage at every turning of the leaf. And thus the unfortunate production was doomed at the very moment of its birth, and consigned to the fate of a Spartan ill-shapen infant, but without the formality of a Spartan inquest. It was a sore calamity to Inglis, who loved it with a mother's love, and his lamentation over it could only find comfort in a lingering of hope. "Alas!" he would exclaim, "I fear I have written my *Gil Blas* for posterity!" We suspect that posterity will have too many novels of their own to busy themselves withal instead of attending to those which their fathers neglected.

After his return from Ireland, Mr. Inglis began to prepare for publication his *Travels in the Footsteps of Don Quixote*—a work the nature of which is indicated by the title. Undeterred also by the failure of his chief attempt in fiction, he had already planned, and even commenced, other works of a similar character, when his overtaken physical endurance gave way under such constant intellectual pressure; and a disease of the brain ensued, of which he died in London, before he had completed his fortieth year. His decease occurred on the 20th of March, 1835.

INGLIS, or ENGLISH, SIR JAMES, an ingenious writer of the early part of the sixteenth century, is chiefly known as the supposed author of the *Complaynt of Scotland*, a very curious political and pamphlet work, published originally at St. Andrews in 1548 or 1549, and the earliest Scottish prose work in existence.

Of this learned person Mackenzie has given an account in his *Lives of Scottish Writers*; but it is so obviously made up of a series of mere conjectures stated as facts that we must reject it entirely. According to more respectable authority, Inglis was a dignified priest (which accounts for the *Sir* attached to his name), and appears from authentic documents to have been in 1515 secretary to Queen Margaret, widow of James IV. Care must be taken to distinguish him from his contemporary John Inglis, who served James IV. as a manager of plays and entertainments, and who is stated to have been present with Sir David Lindsay in the church of Linlithgow when that sovereign was warned by a supposed apparition against his expedition into England. Sir James Inglis was nevertheless a writer of plays, being the subject of the following allusion in Sir David Lindsay's *Testament of the Papingo*:—

"And in the court bin present in thir days,
That ballatis brevis lustely, and layis,
Quhilkis to our prince daily thay do present,
Quho can say more than Schir James English says,
In ballatis, farcis, and in pleasant plaies;
Redd in cunningyng, in practyck rycht prudent;
But Culross bath made his pen impotent."

It will be observed that Inglis is here indirectly spoken of as one of the poets who haunted the court of James V. Even in the preceding reign, however, he appears to have been on an intimate footing at court, as a man of learning. James IV., whose devotion to alchemy is well known, writes a letter (extant in the *Epistola Regum Scotorum*) to Mr. James Inglis, to the following effect: "We have thankfully received your letter, by which you inform us that you are in possession of the abstruse books of the *Sound Philosophy*; which, as certain most deserving persons have begged them of you, you with difficulty preserve for our use, having heard that we are addicted to the study of that art." Of the ballads and plays composed by Inglis not a vestige now re-

mains, unless a poem attributed to him in the Maitland MS., and as such printed by Hailes and Sibbald, entitled *A General Satire*, be held as a specimen of one of those kinds of composition, and be really a production of his pen.

In a charter of 19th February, 1527, Inglis is styled chancellor of the royal chapel of Stirling; and he appears to have been soon after raised to the dignity of abbot of Culross, a promotion which, if we may believe his friend Lindsay, spoiled him as a poet. It was eventually attended with still more fatal effects. Having provoked the wrath of a neighbouring baron, William Blackater of Tulliallan, the abbot of Culross was by that individual cruelly slain, March 1, 1530. The causes of this bloody deed do not appear; but the sensation created by it throughout the community was very great. Sir William Lothian, a priest of the same abbey, who was an accomplice of the principal assassin, was publicly degraded on a scaffold at Edinburgh, in presence of the king and queen, and next day he and the laird of Tulliallan were beheaded.

It would hardly be worth while to advert so minutely to a person who, whatever was his genius, is not certainly known as the author of any existing composition, if the name were not conspicuous in works of Scottish literary history, and must therefore continue to be inquired for in such compilations as the present. Inglis, if the same individual as this abbot of Culross, could have no pretensions to the honour put upon him by some writers, of having written the *Complaynt of Scotland*; for that curious specimen of our early literature was undeniably written in 1548, eighteen years after the death of the abbot. In the obscurity, however, which prevails regarding the subject of the present notice, we cannot deny that he *may* have been a different person, and *may* have survived even to the date assigned for his death by Mackenzie—1554; in which case he *could* have been the author of the *Complaynt*. That a Sir James Inglis existed after 1530, and had some connection with Culross, appears pretty certain from the passage in the *Testament of the Papingo*, which is understood to have been written in 1538. But, on the other hand, there is no authority for assigning the authorship of the *Complaynt* to any Sir James Inglis, except that of Dr. Mackenzie, which rests on no known foundation, and, from the general character of that biographical writer, is not entitled to much respect. Some further inquiries into this subject will be found under the head JAMES WEDDERBURN.

INNES, THOMAS, an historian and critical antiquary, known to the students of early Scottish history by the title of "Father Innes," was a priest of the Scottish college at Paris, during the earlier part of the eighteenth century. It is not creditable to the literature of our country during the period just mentioned that the meritorious labours of this highly acute investigator have been so little noticed, and that no one has thought it worth while to leave memorials sufficient to enable posterity to know anything of his life and character. His labours to discover the true sources of Scottish history proved an ungrateful task; they were unacceptable to the prejudices of the time, and have hardly been appreciated until the memory of the individual who undertook them had quietly sunk into oblivion. In these circumstances any scrap of information which we can procure on the subject is peculiarly valuable. We perceive from a few words in the preface to his *Critical Essay*, that he received the rudiments of education in Scotland; and that he must have left his native country early

in life for a permanent residence abroad, probably, it was only made from a good circumstance, being with the exiled monarch James II. His words are—“Though an honourable gentleman of my own country, and another learned English gentleman, were so kind as to revise the language, and to alter such exotic words or expressions as it was natural should drop from me, I doubt not but the English reader will still meet in this essay with too many marks of my *native language and foreign education*.” But the most interesting, and indeed the principal, notice which we have been able to obtain of this individual, is from the diary of the industrious Wodrow for the year 1724, where we find the laborious antiquary worming his way through libraries in search of materials. It may be remarked that the work on the *Antiquities of the Church of Scotland*, which is mentioned by Wodrow as the subject on which he was engaged, was intended as a second part to the *Critical Essay*, but has, unfortunately for our information on a very interesting subject, not been given to the world. The passage we refer to is as follows:—

“There is one Father Innes, a priest, brother to Father Innes of the Scottish college at Paris, who has been at Edinburgh all this winter, and mostly in the Advocates’ Library, in the hours when open, looking books and MSS. He is not engaged in politics as far as can be guessed; and is a monkish, bookish person, who meddles with nothing but literature. I saw him at Edinburgh. He is upon a design to write an account of the first settlement of Christianity in Scotland, as Mr. Ruddiman informs me, and pretends to show that Scotland was Christianized at first from Rome; and thinks to answer our ordinary arguments against this from the difference between the keeping of Easter from the custom of Rome; and pretends to prove that there were many variations as to the day of Easter even at Rome, and that the usages in Scotland, pretended to be from the Greek church, are very agreeable to the Romish customs, that he thinks were used by the popes about the time that (he) gives account of our differences as to Easter.

“This Father Innes in a conversation with my informant . . .¹ made an observation which I fear is too true. In conversation with the company, who were all Protestants, he said he did not know what to make of those who had departed from the Catholic church; that as far as he could observe generally, they were leaving the foundations of Christianity, and scarce deserved the name of Christians. He heard that there were departures and great looseness in Holland. That as he came through England he found most of the bishops there gone off from their articles, and gone into Dr. Clerk’s scheme. That the dissenters were many of them falling much in with the same method, and coming near them. That he was glad to find his countrymen in Scotland not tainted in the great doctrine of the Trinity, and sound.”²

From the period when we find him rumaging in the Advocates’ Library, we know nothing of Innes, until the publication of his essay in 1729, when he appears to have been in London, and makes an apology for verbal inaccuracies, on the ground that he writes “to keep pace with the press.” He seems previously to this event to have performed an extensive “bibliographical tour,” as the manuscripts he quotes are dispersed through various parts of England, Scotland, Ireland, and the Continent.

A running sketch of the state of the knowledge of

early Scottish history previously to the appearance of this work, may not be unacceptable to those who have not paid particular attention to that subject, as explanatory of the obstacles which the author had to overcome. It is well known that Scotland had a full share of the fabulous early history which it is a proud and pleasing task for savages to frame, and which generally protrudes itself into the knowledge possessed by civilized ages, from the unwillingness of mankind to diminish their own claims to consideration by lessening the glory of their ancestors. The form and consistence of that genealogy which traced the first of Scottish kings to a period some centuries before the Christian era, seems to have been concocted by the Highland senachies, who sang the descent of our monarchs at their coronation. Andrew Wyntoun and John Fordun soberly incorporated the long line thus framed into their chronicle of the Scottish nation from the commencement of the world. Major followed their example with some variations, and Geoffry of Monmouth and Geoffry Keating respectively incorporated the whole with English and Irish history, the latter, much about the same period when Innes wrote, busying himself with tracing the matter to a period anterior to the deluge. The rich and grotesque garb of fable which the whole assumed under Hector Boece is known to many, if not in the original crabbed Latin, at least in the simple translation of Bellenden. It is discreditable to the memory of Buchanan, that, instead of directing his acute mind to the discovery of truth, he adopted, in many respects, the genealogy just sanctioned, and prepared lives for the monarchs created by fiction, suited as practical comments on his own political views. The fables had now received the sanction of a classical authority—Scotland was called *κατ’ ἐξοχήν*, “the ancient kingdom;” and grave Englishmen wondered at the hoary antiquity of our line of monarchs. At length, when the antiquity of the race of England had been curtailed, some thought it unfit that that of Scotland should remain untouched—and several English antiquaries, such as Humphry Lhuyd, Bishop Usher, Bishop Lloyd, and Bishop Nicholson, bestowed some calm hints on its improbability, which were speedily drowned by the fierce replies of the Scottish antiquaries, headed by Sir George M’Kenzie.

Such was the state of historical knowledge in Scotland when Innes wrote; and a Scotsman dared to look the line of ancestry claimed by his monarch calmly in the face, and, after due consideration, to strike from it forty crowned heads. The essay is divided into four parts, in which the author successively treats,—of the progress of the Romans in Scotland—of the history of the Meats, the Strathclyde Britons or Welsh, who existed in the southern part of Scotland—of that of the Caledonians or Picts, who inhabited the whole of the northern portion previously to the arrival of the Scots from Ireland—and of the Scots, the ancestors of the present Highlanders. Examining the foundation on which Boece supports his forty supernumerary kings, he shows by very good negative evidence, that two chroniclers, on which that author lays the burden of much of his extraordinary matter, named Veremund and Campbell, never existed, and shows that the genealogists had, by an ingenious device, made Fergus I., king of the Scots, Fergus the *second*, and had placed another Fergus sufficiently far behind him in chronology to admit a complement of kings to be placed betwixt the two. Besides the detection of the fabulous part of our history, this work supplies us with an excellent critical dissertation on the various early inhabitants of the country; and the author has, with much pains and care, added an appendix of original docu-

¹ The name & in a secret hand.

² Wodrow’s *Diary*, Mss. Adv. Lib. v. 46.

ments, which have been highly useful to inquirers into Scottish history. The language in which the whole is clothed is simple, pleasing, and far more correct than that of most Scotsmen who wrote during the same period; while there is a calm dignity, and a philosophical correctness in the arguments, previously unknown to the subject, and which it had been well if those who have followed the same track had imitated. Pinkerton, who would allow no man to be prejudiced on the subject of Scotland with impunity except himself, never can mention the work of Innes without some token of respect. "This work," he says, "forms a grand epoch in our antiquities, and was the first that led the way to rational criticism on them: his industry, coolness, judgment, and general accuracy recommend him as the best antiquary that Scotland has yet produced."¹ While concurring, however, in any praise which we observe to have been elicited by this too much neglected work, we must remark that it is blemished by a portion of it being evidently prepared with the political view of supporting the doctrine of the divine right of kings, which Innes as a Jacobite probably respected, and as an adherent of the exiled house felt himself called on to support.² He is probably right in presuming that Buchanan knew well the falsehood of many of the facts he stated, but it was as unnecessary that he should answer the arguments which Buchanan, in the separate treatise *De Jure Regni apud Scotos*, may have been presumed to have derived from such facts, as it was for Buchanan to erect so great a mass of fable; while the dissertation he has given us on the fruitful subject of the conduct of Queen Mary, is somewhat of an excrescence in a dissertation on the early inhabitants of Scotland.

The political bias of this portion of the work is avowed in the preface, where the author observes that the statements of Buchanan, "far from doing any real honour to our country, or contributing, as all historical accounts ought to do, to the benefit of posterity, and to the mutual happiness of king and people, do rather bring a reproach upon the country, and furnish a handle to turbulent spirits to disturb the quiet and peace, and by consequence the happiness of the inhabitants;"³ yet even this subject is handled with so much calmness that it may rather be termed a defect than a fault.

Besides the great work which he wrote, Innes is supposed to have been the compiler of a book of considerable interest and importance. It is pretty well known that a manuscript of the life of King James II., written by himself, existed for some time in the Scots College of Paris, where it was carefully concealed from observation. This valuable work is believed, on too certain grounds, to have been reduced to ashes during the French Revolution; but an abstract of it, which was discovered in Italy, was published by Mr. Stanyers Clarke in 1806, and is supposed by well-informed persons to have been the work of Father Innes.⁴ We have been enabled to

trace this supposition to no better source than a presumption from the circumstances in which Innes was placed, and to the absence of any other name which can reasonably be assigned. There is indeed a document extant which might afford ground for a contrary supposition. In 1740 Carte, the historian, received an order from James Edgar, secretary to the Pretender, addressed to the Messrs. Innes, permitting him to inspect the life writ by Mr. Dicconson, in consequence of royal orders, all taken out of and supported by the late king's manuscripts; but it has been urged on the other hand, that there were at least two copies of the compilation, one of which may have been transcribed by Mr. Dicconson, while in that published there are one or two Scotticisms, which point at such a person as Innes. Little can be made of a comparison betwixt the style of this work and that of the essay, without an extremely minute examination, as Innes indulged in few peculiarities; but there is to be found in it a general resemblance, certainly more close than what could be caused by mere identity of period.

We are enabled to give but one other notice bearing on the life of this individual. In the portion of the life of James II. transcribed into the Chevalier Ramsay's *History of Turenne*, there is a certificate by the superiors of the Scots College at Paris, dated 24th December, 1734, signed by "Louis Inesse, late principal, Alexander Whiteford, principal, and Thomas Inesse, sub-principal." The Louis Innes who had acted as principal must be the brother to the historian mentioned by Wodrow.

IRVINE, CHRISTOPHER, an antiquary, philologist, and physician, lived in the seventeenth century, and was a younger son of the family of Irvine of Bonshaw in Lanarkshire. Like his relation who rendered himself infamous in the cause of royalty by seizing Donald Cargill, Christopher Irvine was a devoted adherent of the Stuarts and of Episcopacy. He was turned out of the college of Edinburgh in 1638 or 1639, in consequence of his resisting the national covenant; and by some connection, the nature of which is not known, with the Irish troubles which happened not long after, he lost a plentiful patrimony. Of these circumstances he himself informs us, in the address appended to one of his works, as well as of the facts, that "after his travels, the cruel saints were pleased to mortify him seventeen nights with bread and water;" and even after having recalled an act of banishment which they had formerly passed against him, subjected him to the fate of absolute starvation, with only the dubious alternative of "teaching grammar." Having adopted the latter course, we have ascertained from another source⁵ that he was schoolmaster first at Leith, and afterwards at Preston. In the course of his exertions in this capacity he was led to initiate his pupils in Scottish history; and it was out of the information collected for that purpose, along with some notes he received from Mr. Alexander Home and Mr. Thomas Crawford, formerly professors of humanity in Edinburgh university, that he compiled his *Nomenclature of Scottish History*, the work by which he is best known. Some time during the Commonwealth he appears to have resumed the profession to which he was bred, and practised first as a surgeon, and finally as a physician in Edinburgh, at the same time that he held a medical appointment in the army of General Monk, by which Scotland was then garrisoned.

We have not been able to discover any earlier

¹ Pinkerton's *Inquiry*, Introduction, 55-57.

² We cannot avoid coupling with this feature the circumstance of our having heard it whispered in the antiquarian world, that a correspondence between Innes and the court of St. Germain, lately discovered, shows this to have been the avowed purpose of the author. This we have heard, however, in so vague a manner, that we dare not draw any conclusions against the fair intentions of Innes, farther than as they may be gathered from his own writings.

³ Preface, 16.

⁴ In the *Edinburgh Review* we discover the following note:—"It is the opinion of the present preserver of the narrative, that it was compiled from original documents by Thomas Innes, one of the superiors of the college, and author of a work entitled *A Critical Essay on the Ancient Inhabitants of Scotland*.—*Art. on Fox's Life of James II.* Ed. Rev. xii. 280.

⁵ Sibbald's *Bibliotheca Scotica*, MS. Adv. Lib.

publication of Christopher Irvine than a small and very rare volume, entitled *Bellum Grammaticale*, which appeared at Edinburgh in 1650, but of the nature of which, not having seen it, we cannot speak. His second performance was a small volume, now also very rare, having the following elaborate title: "*Methodus Magnetica*: or the rare and wonderful art of curing by sympathy, laid open in aphorisms, proved in conclusions, and digested into an easy method drawn from both; wherein the connection of the causes and effects of these strange operations are more fully discovered than heretofore. All cleared and confirmed by pithy reasons, true experiments and pleasant relations, preserved and published as a masterpiece in this skill by C. de Iryngio, chirurgo-medicine in the army. Printed in the year 1656." The dedication, which is dated from Edinburgh, June 3, 1656, and is signed "C. Irvine," is addressed to General Monk as "chief captain of those forces among whom for diverse years I have served and prospered;" and speaking of the kindness of the commander toward his inferiors, he continues—"This is observed by all; this hath been my experience so oft as I had need of favour and protection." We may from these passages argue, that at the period when he composed this book, Irvine himself was a man of respectable standing as to years, and had not found it inconsistent with his loyalist principles to take office under Cromwell. The work itself is a true literary curiosity. The monstrous and fanciful doctrines which crowd the pages of Paracelsus and Cardan, and which had begun at that period to sink before the demand for logical proof and practical experience, which more accurate minds had made, are here revived and even exaggerated; while the imagination of the writer seems to have laboured in all quarters of nature, to discover grotesque absurdities. The book, it will be remarked, is a treatise on animal magnetism. We would give his receipt for the method of manufacturing "an animal magnet" did we dare, but propriety compels us to retain our comments for the less original portion of the work. The principles of the author *de omnibus rebus et quibusdam aliis*, are laid down in "an hundred aphorisms," which are of such a nature as the following:—"Neither souls nor pure spirits, nor intelligencies can work upon bodies, but by means of the spirit; for two extremes cannot be joined together without a mean, therefore," it is justly and conclusively argued, "demons appear not but after sacrifices used." "He that can join a spirit impregnated with the virtue of one bodie with another, that is now disposed to change, may produce many miracles and monsters." "He that can by light draw light out of things, or multiply light with light, he knoweth how to adde the universal spirit of life to the particular spirit of life, and by this addition do wonders," &c. Nor is his method of supporting his aphorisms by proof less original and conclusive. The readers of *Hudibras* will recollect the story taken from Helemont, of the man who, having lost his nose, procured a new one to be cut from the limb of a porter, on whose death the unfortunate nose grew cold and fell off. The reasoning of Mr. Christopher Irvine on this matter is peculiarly metaphysical. "Is not," he says, "all our doctrine here confirmed clearer than the light? was not the insidious nose as animated at the first, so still informed with the soul of the porter? Neither had it any from the man whose nose now it was made, but only nourishment; the power of the assimilation which it hath from its proper form, it took it not from him but from the porter, of whom it was yet truly a part; and who dying, the nose became a dead

nose, and did immediately tend to corruption. But who doth not here see, most openly and evidently, a concatenation? otherwise, how could the nose of one that was at Bologna, enform the nose of one that was at Brussels, but by means of a concatenation?" The curiosity of the matter, presenting a specimen of the speculations in which several Scottish philosophers at that period indulged, may excuse these extracts.

The work to which Irvine's name is most frequently attached, is the *Historia Scotica Nomenclatura Latino-Vernacula*; an explanatory dictionary of the Latin proper names made use of in Scottish history, published at Edinburgh in 1682, and republished in 1819. The editor of the reprint observes that he "intended, along with the present edition, to have given the public a short sketch of the life of the author; but this intention he has been obliged to relinquish from want of materials. To numerous inquiries in many directions no satisfactory answer was procured, and the editor mentions with regret, that he knows nothing more of this eminent literary character and profound philologist than can be collected from his address to the reader." The dedication is to the Duke of York; and if we had not been furnished with vast specimens of the capacity of royal stomachs at that period for flattery, we might have suspected Mr. Christopher of a little quizzing, when he enlarges on the moderation, the generosity, the kindness to friends, the forgiveness to enemies, displayed by the prince, and especially on his having "so firmly on solid grounds established the Protestant religion." Among the other eulogiums is one which may be interpreted as somewhat apologetical on the part of the author, in as far as respects his own conduct. "The neglected sufferer for loyalty is now taken into care and favour, and they that have recovered better principles are not reproached nor passed by; their transgressions are forgot, and time allowed to take off their evil habit." The *Nomenclature* is a brief general biographical and topographical dictionary of Scotland. With a firm adherence to the fabulous early history the author shows vast general reading; but, like most authors of the age, he seems to have considered Scotland the centre of greatness, and all other transactions in the world as naturally merging into a connection with it. Thus in juxtaposition with Argyle, we find "Argivi, Argos, and Arii." And the Dee is discussed beside the Danube.

From the address attached to this volume we learn that its publication was occasioned by his recent dismissal from the king's service. "And now," he says, "being, as it seemeth by a cruel misrepresentation, turned out of my public employment and livelihood, which the Defender of the sincere will return, I have at the desire of the printer, in this interval, revised," &c. Taking the dedication in connection with this circumstance, there can be little doubt as to the particular object of that composition; and from another document it would appear that he was not unsuccessful in his design. An act of parliament, dated three years later than the publication of the *Nomenclature*, and ratifying an act of privy-council, which had reserved to Irvine the privilege of acting as a physician, independent of the College of Physicians of Edinburgh, just established, proceeds upon a statement by the learned man himself, that "he has been bred liberally in these arts and places that fit men for the practice of physick and chirurgery, and has received all the degrees of the schools that give ornament and authority in these professions, and has practised the same the space of thertie years in the eminentest places and among very considerable persons in this island, and has, by virtue of commis-

sions from his royal master, exerted the duties of surgeon of his guards of horse twenty-eight years together, and has had the charge of chief physician and surgeon of his army.¹ He then states that he wishes to practise his profession in peace in the city of Edinburgh, of which he is a burgess, and hopes the council "would be pleased not to suffer him, by any new gift or patent to be stated under the partial humors or affronts of (a) new incorporation or college of physicians, composed of men that are altogether his juniors (save Doctor Hay) in the studies of philosophy and practise of physic."

IRVING, DAVID, LL.D. This talented and painstaking writer, who has done so much in preserving our old Scottish literature, and the memory of its choicest ornaments, was born in the little town of Langholm, in the county of Dumfries, on the 5th of December, 1778. His father, Janetus Irving, descended from a line of farmers in Eskdale, was in comfortable circumstances as a tradesman, and resided in Langholm. David, the youngest of four sons who arrived at maturity, received like the rest as liberal an education as his native town could afford, and for this purpose he attended the grammar-school of Langholm, conducted by Mr. John Telfer. These early school-days of David Irving were not signalized by any extraordinary proficiency in scholarship; indeed, his career was so slow, or its ultimate object as yet so undecided, that he had reached the age of fourteen or fifteen before he turned his attention to the dead languages—a case somewhat rare in Scotland even among the rustic pupils of a country school. Still, no time appears to have been lost, for he inherited from his mother, who died in 1797, those intellectual abilities, that fondness for reading, and retentive memory for which he was remarkable, and a silent progress was going on in his mind of which society was afterwards to reap the benefits. Of a still more conspicuous character for the time being were the warlike achievements, the battles and combats, by which his boyhood was distinguished. So late as the beginning of the present century the more violent national characteristics of our country had not died out, and every school had its feud with some rival school or party, between which, hostile meetings, and battles with stones, sticks, or fists were of daily occurrence. Nor was the matter greatly amended when there was no opposing party to contend with: in this case, the pugnacious urchins, like the schoolboys of a larger growth in a senate or royal council, could find or invent a very pretty quarrel, and fight out the fight after the alleged cause had been forgot. Nay, rather than be idle, a class or school would divide itself into Greeks and Trojans, or English and Scots, and belabour each other in fun until the work had warmed into earnest. In this way the juvenile pugnacity of our grave sires and grandsires was vented, and the peace of the town and village broken as well as heads and windows; while the only justification that could be offered was—

"Nothing in hate, in honour all was done."

In such conflicts David Irving was not only an actor, but a conspicuous ringleader. This, however, was not enough for his ambition, and he ended his campaigning by forming a regiment of forty or fifty boys armed with sticks, whom he regularly drilled and governed by military law. Soon after, he showed his readiness for war in earnest, in consequence of the French revolution and its threats of an invasion

of Britain. On this occasion the patriotic drum was sounded loudly over Scotland, and in the church of Langholm the inhabitants were collected, and asked who would sign an engagement to arm in defence of their king and country? At the question Irving, although then scarcely sixteen years of age, was among the first, if not the very first, to ascend the church gallery and subscribe his name. It was not however in war, but in literature, that this loyal and martial spirit was to find its proper vent.

We have already alluded to the delay which occurred before he advanced to the study of Latin and Greek. This he now commenced at the age of fourteen or fifteen, probably with the ultimate intention of qualifying himself for the church. The school which he attended for this purpose was at New Langholm, and had for its teacher Mr. Andrew Little, who had lost his sight by lightning on the coast of Africa, when surgeon of a Liverpool vessel. For the lame or the deformed to become school-masters was at that time no novelty; but for a blind man to adopt an office which requires quick notice and sharp inspection, was an instance of extraordinary courage. Little, however, notwithstanding such a serious defect, appears to have been an excellent teacher of the learned languages, as was attested by the progress of his pupils, and especially of Irving, who here laid the foundation of that classical knowledge for which he was distinguished among his contemporaries. Having completed his school education David Irving entered the university of Edinburgh, in October, 1796, and during that and the two following sessions prosecuted the study of Latin and Greek, logic, ethics, and natural philosophy under the distinguished professors Finlayson, Dugald Stewart, and Playfair. To maintain himself at college, and perhaps also to forward his views towards the ministry at a time when no church could be obtained without a patron, he became tutor to a son of the receiver-general, at that time a student in the university of Edinburgh. But soon after his arrival in Edinburgh, he secured that kind of patronage which was to be more available for his future course than that of a holder of church presentations. He formed the acquaintanceship of Dr. Robert Anderson, the talented editor of the *Works of the British Poets*, who at that time resided in Edinburgh, honoured as the literary Aristarchus of our capital, and the kind patron of young men of genius, whom he assembled at his hospitable table and aided with his counsel and encouragement. Among these young aspirants of fame, whose first flights he inspired, and who afterwards took a high place in the world of letters, it is enough to mention Thomas Campbell, who at the instance of Dr. Anderson published the *Pleasures of Hope*, which otherwise might never have appeared.

Under the fostering care of such a friend and counsellor, the bias of Irving towards a life of literature was directed; and the bent of it was also indicated by his first publication, the "*Life of Robert Fergusson*, with a Critique on his Works," which he inscribed in 1799 to Dr. Anderson. Irving thus commenced his career of authorship in his twenty-first year, and in a department which was to occupy him until the close of his long life—that of a biographer of Scottish poets, and annotator of their poetry. After this he wrote the lives of William Falconer, author of the *Shipwreck*, and of Dr. William Russell, author of the *History of Modern Europe*, and published the three lives collectively in a separate volume at the close of 1800. In the next month (January 30, 1801) he graduated as Master of Arts, and during the same year he pub-

¹ *Acts of the Scottish Parliament*, viii. 530-531.

lished his *Elements of English Composition*. This work, the most useful and successful of all Dr. Irving's productions, he modestly called a compilation, but the skill with which he selected and arranged the materials, and the instructions it conveyed in the art of composition, gave it all the worth of originality. The esteem in which this volume was held, and the demand made for it as a text-book in English schools and academies, was indicated by the fact, that seven editions of it were published in less than as many years. An eighth edition, revised by his own hand, appeared in 1828.

When he had finished his curriculum of literature and science at the university, it might have been expected that Dr. Irving would have enrolled himself as a student in the divinity hall. But his original intention of devoting himself to the work of the ministry, if ever seriously entertained, had by this time died out, and the fact of his being an author and a successful one may have had a powerful influence in effecting the change. Accordingly in 1802, instead of commencing the study of theology, he entered the class of civil law, but not abating in the meantime his zeal in authorship, which he now seems to have adopted as his chief occupation. In 1804 his diligence in his favourite course of study appeared, by his publication of "*Lives of the Scottish Poets, with Preliminary Dissertations on the Literary History of Scotland, and the Early Scottish Drama*." Although it was favourably received by the judicious few who could appreciate the merits of the work and the importance of the subject, their number was as yet too small to influence the general opinion, and his *Lives of the Scottish Poets* failed to secure the popularity which it justly merited. Instead of being discouraged by this cold reception, it only animated him to fresh effort, and he now contemplated a *Life of George Buchanan*, the most difficult of all his literary attempts. This will appear not only from the scholarship which such a task required, but the contradictory characters which have been drawn of George Buchanan himself, and the confusion of the times in which he lived. But the stern old Scottish republican in theory, and equally stern preceptor of a king in practice; the cynical wit, the eloquent historian, distinguished poet, philosopher, and scholar, had now found an earnest but impartial biographer, and Irving commenced his labour by an exploration into the records of the literature of the sixteenth century contained in the libraries of the British Museum, Sion College, and Red Cross Street, as well as those of his own country. The result of this labour and research was the *Memoirs of the Life and Writings of George Buchanan*, which appeared in 1805; a work that was considered not only to vindicate the fair fame of our renowned countryman, but to establish the character of his biographer as an able writer and accomplished scholar. Irving was now a man of note, his acquaintanceship was sought by the most distinguished of our northern scholars, and in 1808 the degree of Doctor of Laws was conferred upon him by Marischal College, Aberdeen. In the same year there was a classical chair to be filled in the newly established college of Belfast, for which Dr. Irving became a candidate, and was furnished for the purpose with testimonials from three of our most learned professors, recommending him in the highest terms as possessing every quality for the office. But "on finding that this new institution was to be placed on a less liberal footing than had originally been expected," Dr. Irving withdrew his application. Mention has already been made of the intimacy he had formed while a student with Dr. Anderson; this had continued unimpaired, and

on June 1, 1810, was ripened into a marriage with Anne Margaret Anderson, the eldest daughter of that worthy litterateur whose advice and example had so influentially directed his career. But this happy union was a brief one, as Mrs. Irving died only two years subsequent to her marriage, after giving birth to a son. When he had recovered from the blow, her husband drew up a biography of the deceased, under the title of *A Memorial of Anne Margaret Anderson, the Wife of David Irving, LL.D.*, in the form of a letter to Principal Brown of Aberdeen, 16th August, 1812. This short memoir was printed in the following year, but only for private circulation, and was accompanied with verses which had been addressed to her while Miss Anderson by Dr. Leyden, Dr. A. Murray, J. S., and David Carey.

Although Dr. Irving, as has been already stated, became a student of law, it appears to have been rather for the purpose of enlarging his general knowledge than following it as a profession. He was not the less disposed to turn it to practical account, and as he received young gentlemen into his house as boarders while they were attending the university, he gave private instructions in civil law to such of them as proposed to pass their examinations for the purpose of becoming advocates. With the same view he printed a tract for private circulation in 1815, entitled *Observations on the Study of the Civil Law*, which was reprinted in 1820, and afterwards in 1823. He also intended to publish the *History of Roman Jurisprudence*, but finding no encouragement, the purpose was abandoned. Soon after he turned to what was perhaps a more congenial occupation: this was a new edition of his *Life of Buchanan*, which he so carefully revised and so greatly amplified as to make it almost a new work, and published it in 1817.

Although the study of law had as yet done so little for him, it was now to bring its reward. In March, 1818, the office of principal librarian to the Faculty of Advocates became vacant, and few offices in Scotland could be more tempting to a person of studious habits. The rich collection of books and manuscripts, especially such as are connected with the early history and literature of Scotland, which their library contains, and the respectable position, competence, and leisure enjoyed by the librarian, were enough to rouse the learned and talented of our country to become competitors for such an office. The library also had drifted into such a state of confusion, that it required a perfect master of books to bring its contents into order; and aware of this, the Faculty of Advocates had increased the inducements, so that there was no lack of distinguished men as candidates. Among the foremost of these was Dr. Irving, and although the election was delayed until June, 1820, he was chosen by a large majority. Still, however, there was considerable discontent and demur: it was alleged that, however learned, Dr. Irving could not bring himself to the practical details of his office; that although so well acquainted with books, he was deficient in the arts of classifying and handling them; and that without these personal qualifications, which are so independent of scholarship, he was not likely to prove a useful and practical librarian. In short, an experienced functionary was wanted for the arrangement of the Library of Advocates. Fortunately, however, it happened that Dr. Renecke had offered to aid the new librarian, by showing him the management of the Göttingen library, and had proposed that for this purpose Dr. Irving should pass the ensuing vacation at Göttingen. The latter assented, and on repairing to this distin-

guished seat of German scholarship, he not only learned the best methods of classifying a library, but became acquainted with several of the most distinguished professors of the university of Göttingen.

In 1837 they sent him their diploma of Doctor of Laws, in addition to that which had been conferred on him by Marischal College, Aberdeen. On the return of Dr. Irving from Germany, he entered a second time into marriage, his partner on this occasion being his second cousin Janet Laing, daughter of Mr. Charles Laing, Canobie, whom he married on the 28th of October, 1820.

Having now a comfortable home and an amiable helpmate, a situation that yielded an adequate provision for his lifetime, and duties that were both easy and congenial, Dr. Irving had attained that fair ideal in point of position which so many literary men sigh for and seek in vain. But there was no remission in his literary labours except such as arose from his professional duties, and both as author and editor, his contributions in his own favourite department were numerous and acceptable. For the Bannatyne and Maitland Clubs he edited, among other works, a republication of Dempster's *Historia Ecclesiastica sive de Scriptoribus Scotis*, the similar work by David Buchanan, prefaces to the metrical romance of *Clarin-dus*, the tragedy of *Philotus*, and *Henryson's Fables*; also biographical notices to an edition of the poems of Alexander Montgomery, author of *The Cherrie and the Slae*. But it was to the seventh edition of the *Encyclopædia Britannica* that his contributions were the most abundant, extending from 1830 to 1842. They consisted of nearly all its biographical articles connected with Scotland, besides the articles on "Jurisprudence," "Canon Law," "Civil Law," and "Feudal Law;" and from the biographies thus supplied he prepared two volumes, which he published in 1839, entitled *Lives of Scottish Writers*. Two years earlier he published his *Introduction to the Study of Civil Law*. The last publication which he lived to complete and issue, was a new edition of *Selden's Table-talk*, with notes, which appeared in 1854.

Although Dr. Irving abandoned his original intention of devoting himself to the work of the ministry, his secession appears to have been owing to personal scruples rather than any doubt in the truths of Christianity. This was shown by the fact, that in his earlier years he belonged to the congregation of the Old Church, St. Giles, and that he afterwards passed first to the New Grayfriars, and afterwards to St. Stephen's parish during the incumbency of the Rev. Dr. Muir, under whom he officiated for several years as one of his elders. On the Disruption of 1843 he left the Established for the Free Church, and became an elder in Free St. John's Church, which has for its ministers Dr. Guthrie and Dr. Hanna. It was a happy circumstance, that although this rending asunder of the national ecclesiastical establishment produced an alienation of feeling among the members of the two rival churches, the alienation was only temporary, and after a short time the parties were again at one in the friendly intercourse of social life. Thus it was with Dr. Irving, whose society with his literary associates, and the esteem in which they held him, this violent religious transition scarcely interrupted. A disruption that was more immediately personal, and which separated him from his beloved office, occurred in 1848. The curators of the Advocates' Library having found it necessary to make such changes in the establishment as would require both active and laborious service, Dr. Irving, in conformity with arrangements into which he entered with them, resigned his office as keeper of

the library, after he had held it for twenty-nine years. It was a painful wrench from a locality in which he had grown old, and the duties of which he had discharged so ably and affectionately; and his life was thenceforth spent in his home, No. 6 Meadow Place, a beautiful rural retirement in the outskirts of Edinburgh, and within five minutes' walk of the place of his late daily occupation. But he did not subside into idleness by the change; on the contrary, both his physical and intellectual powers were as active as ever, and his wonted labours in the study were alternated with healthful walks in the surrounding Meadows. His memory also in dates, facts, and subjects, for the readiness and accuracy of which he had always been remarkable, was as vivid and exact as before, while he was always willing to impart its stores to every literary inquirer. But it was his own dwelling that was endeared to him with deeper intensity after his separation from the Advocates' Library; and the cause of this is touchingly described in his obituary in the *Witness* newspaper, written by his minister Dr. Hanna. "That attachment," writes the eloquent biographer of Dr. Chalmers, "which had here suffered such a violence, now transferred itself with all its force to his own private library, which he now nursed with double care. It grew beneath that care. He has left about 7000 volumes, all in the most perfect order, many of them rare and valuable—altogether one of the best private collections that our city contains. It was among these books he lived, and it was actually among them that he died. Every upper room in his house was clothed with book-shelves, his own among the rest. He lay upon his death-bed surrounded with them. Within a few hours of his decease his eye chanced to rest upon a new edition of Whiston's *Josephus* that he had lately added to his stores. He asked his daughter, who acted as his librarian, to hand him one of the volumes. He took it tenderly into his hands, turned it over and over again, regarding it with a placid and benignant look. He tried to open and to read it, but the feeble hands and eyes refused the office. It fell out of his hands upon the bed. His daughter took it up to replace it on the shelf. His quick eye followed her, and noticed that, in her haste, she had pushed it in too far. With something like impatience he directed her to draw it out and place it level with the rest. It was done as he directed, and he was pleased. It was his last earthly act."

Thus Dr. Irving passed away, and like the old northern heroes it might be said of him, that he died in harness, and strong in his ruling passion to the last. His death occurred on the 10th of May, 1860, in the eighty-second year of his age. By his second marriage he had two sons and two daughters. His eldest son, James, is a surgeon in the East India Company's service, and his second, David, who was an ensign in the 17th regiment of Native Infantry, died in Sind at the age of twenty-one. A work of Irving, which was not published until after his own death, was his *History of Scottish Poetry*, which he had been preparing for the press so early as 1828, but which he appears to have afterwards laid aside. It was thought, however, too valuable by his literary executors to remain in MS., and accordingly it was published in 1861, edited by John Aitken Carlyle, M.D., and with a memoir of the author prefixed by David Laing, LL.D., of the Signet's Library, from which the facts of this biographical notice are derived.

In personal appearance Dr. Irving was tall, stately, and strongly built, and these advantages of person were set off by a careful attention to dress, so that

he always appeared in a full costume of black, which he wore to the end of his days. This peculiarity, with his upright figure and dignified but somewhat formal step, were in complete accordance with the style of his writings, which was always vigorous, often eloquent, but pervaded throughout with a preciseness which occasionally was mistaken for pedantry and affectation. To strangers, his manner was cold and his language stern and abrupt; but those who knew him intimately were aware how completely he could unbend in conversation, especially when the favourite subjects of his study were the topic. But it is with his literary character that we have chiefly to do, and this is discriminately sketched by Dr. Laing in the following words: "As an author, Dr. Irving in all his works exhibits no common degree of learning and research, combined with great clearness and precision of language, along with critical sagacity and minute accuracy in his statements. His research did not lead him to any laborious examination of unpublished sources of information; his faculty lay rather in availing himself of all that had previously been discovered, for which he was so well qualified by his familiar acquaintance with the standard literature both of ancient and modern times. His critical knowledge of ancient authors and of literary history has seldom been equalled in this country. But these qualities, and the care bestowed in the choice of words and the construction of his sentences, have imparted a certain degree of formality to his style. As a learned, accurate, and successful labourer in the field of literary biography, it is not, however, too much to assert, that Dr. Irving's name will always be remembered in Scotland."

IRVING, REV. EDWARD, A.M. This remarkable pulpit orator, and founder of a sect, was born in Annan, Dumfriesshire, in the year 1792. His family was originally from France, but had long been settled in the west of Scotland. His father, Gavin Irving, followed the business of a tanner, in which he was so successful that he became a substantial burgess in Annan, and possessed considerable landed property in the neighbourhood of the town. The mother of Edward Irving was Mary Lowther, daughter of one of the heritors of Dornock. She had three sons, of whom Edward was the second, and five daughters; but the male part of her family died before her; the eldest in the East Indies, the youngest in London, and the second in Glasgow. Edward Irving's earliest teacher was an aged matron named Margaret Paine, an aunt of the too celebrated Thomas Paine, whom, it was said, she had also taught to read; and thus, at different extremes of her life, if the statement may be received, she was the instructress of two men entirely unlike in character, but both remarkable for their religious aberrations. From her charge Edward Irving passed to that of Mr. Adam Hope, an excellent teacher of English and the classics; but his progress as a school-boy gave little promise of the talents which he afterwards manifested. From Annan he went as a student to the university of Edinburgh, and there his proficiency in mathematics was so distinguished, that before he had reached the age of seventeen he was recommended by Professor Leslie as the fittest person to teach that department of science in an academy at Haddington. After having occupied this situation for a year, he was translated to a similar office in the larger establishment at Kirkcaldy, where he also kept boards and employed his leisure hours in private tuition. In this way he was occupied nearly seven years at Kirkcaldy, attending the divinity hall

of Edinburgh as what is termed an "irregular student;" that is to say, giving attendance a certain number of weeks annually for six years, instead of four complete winters; this accommodation being made in favour of those students for the church who occupy settled situations at a distance from the college. During all this period his application to study must have been intense, and his progress considerable, though silent and unobtrusive. Of this he afterwards gave full proof, by his acquaintance with several of the living languages, as well as the wide range which his reading had comprised. At an early period, also, the subject of religion had occupied much of his solicitude; and when only seventeen years old he was appointed one of the directors of a missionary society. This fact he afterwards stated more than once, when his violent invectives against the secularity of missions made his attachment to missionary enterprise itself be called in question.

After completing the appointed course of study, Mr. Irving was licensed as a preacher in his native town of Annan. But the prospect of a church was dim and distant, for he had secured no patron; indeed, even long before, he had regarded patronage as the great abomination of the Kirk of Scotland, while in those days popular suffrage went but a little way in the election of a minister. The inaction of an unpatronized probationer was however too much for one of his chivalrous love of enterprise, and he resolved to become a missionary, and follow the footsteps of Henry Martyn. Persia was to be the field of his labour; and he began to qualify himself by studying the languages of the East. It was perhaps as well that the experiment of what effect a career in the "land of the sun" would have produced upon such an inflammable brain and sturdy independent spirit was not to be tried. At all events, it is certain that his course would have been out of the ordinary track, whether for evil or for good. While thus employed, he was invited by Dr. Andrew Thomson to preach for him in St. George's Church, Edinburgh, with the information that he would have Dr. Chalmers, then in search of an assistant, for his auditor. Mr. Irving complied; but after weeks had elapsed, in which he heard nothing further of Dr. Chalmers, he threw himself at haphazard into a steam-vessel at Greenock, resolving to go wherever it carried him, previous to his departure for the East, on which he had now fully determined. He landed at Belfast, and rambled for two or three weeks over the north of Ireland, where he associated with the peasantry, slept in their cabins, and studied with intense interest the striking peculiarities of the Irish character. During this eccentric tour, a letter reached him at Coleraine that quickly brought his ramble to a close: it was a letter from Dr. Chalmers inviting him to Glasgow, for the purpose of becoming his assistant. To the great metropolis of northern commerce he accordingly hurried; and true to his anti-patronage principles, which were now brought to the test, he stipulated that he should be proved and accepted by the people as well as their minister, before he entered the assistantship. The trial was made and was successful. Dr. Chalmers himself had made the choice, and this was enough to satisfy the most scrupulous.

It would have been difficult to have selected a pair so unlike each other, and yet so congenial, as Dr. Chalmers and his assistant. The latter, now twenty-eight years old, had at last found a sphere in which he could display, not only his striking advantages of person, but his cherished peculiarities of disposition. There was therefore, even already, a measured stateliness in his bearing, and authoritative accent in his conversation, that were in full keeping with his tall

figure, rich deep-toned voice, and remarkable Saviour Rosa countenance; and although the onlooker felt as if there was something too artificial and melodramatic in all this, yet he was obliged to confess withal that it sat gracefully upon him, although it would have suited no other man. But what a contrast to Dr. Chalmers, the very personification of unstudied, unaffected simplicity! This contrast, so startling, but yet so amusing, was especially perceptible in a crowded company. The Doctor generally sat with all the timidity of a maiden, and was silent unless addressed, or even dragged into conversation; but as for his assistant—

* Stately, strong'd he coast the hall,
And sturdy step'd he west.

He was too impatient to be at rest, and too full of stirring thoughts to be silent; while the eloquence of his continuous stream of conversation, or rather discourse, made him always sure of a willing audience with Chalmers himself at their head. This very circumstance of contrast, however, is often the strongest ground of affection; and it was delightful to witness the cordiality with which the pair moved together through their common duties in St. John's parish. As a preacher, indeed, Mr. Irving enjoyed no great share of popularity; and for this two reasons may be assigned. In the pulpit of Dr. Chalmers the established standard of excellence was so high that no preacher but himself could reach it. Mr. Irving's peculiarities also, both of manner and style, which were afterwards such a rich treat to the people of London, were too highly seasoned for the simple tastes of the Glasgow citizens. It was chiefly among the students, who were able to appreciate the sterling worth of his sermons, that he was popular; and by many of these competent critics he was reckoned scarcely inferior to Chalmers himself. But it was in pastoral visitation that Mr. Irving was best appreciated, both by Dr. Chalmers and the community at large. And, indeed, for such a duty he was admirably fitted, for the dark places of St. John's parish were crowded with that sort of people who are seldom insensible to such personal advantages as he possessed; and while his kindness soothed the afflicted and encouraged the timid, his regal bearing or reproving frown could dismay the profligate and silence the profane. His warm-hearted open-handed benevolence kept pace with his zeal, so that among the poor of that populous but indigent district he was enthusiastically beloved. On one occasion, indeed, he manifested in a striking manner that utter disregard of money which he entertained to the close of his life. He had received, by the bequest of a departed relative, a legacy amounting to some hundreds of pounds. He threw the mammon into an open desk; and without keeping count of it, was wont, in his daily rounds, to furnish himself with a sheaf of these notes, which he doled among the poor of his people until the whole sum was spent, which very soon was the case.

After living three years in Glasgow as assistant to Dr. Chalmers—the happiest portion, we doubt not, of his life, and perhaps also the most useful—a change occurred, by which Mr. Irving was to burst into full notoriety. Already he had been offered a call to a church in Kingston, Jamaica, which he would have accepted had he not been dissuaded by his relatives. He also, it was said, had got the offer of a living in one of the collegiate charges of Scotland, but refused it on account of his conscientious feelings regarding patronage. Now, however, instead of obscure exile, he was to be called into the vast and stirring world of London, and become a minister there independent of the presentation of a patron. A Presbyterian

chapel in Cross Street, Hatton Garden, attached to the Caledonian Asylum, was at this time not only without a minister, but without a congregation; and a popular preacher was needed to fill both pulpit and pews. One of the directors of the asylum had heard of Mr. Irving, and judged him the fittest person for the emergency: he represented the case to his brethren in office, and in consequence Mr. Irving was invited to London to preach before them. This was the kind of election that suited him, and he preached four Sundays in Hatton Garden with such acceptance to the handful of auditors that he received a harmonious call to enter upon the charge. The only difficulty in his way was an old statute, by which the Scotch minister of Hatton Garden was obliged to preach in Gaelic as well as English; but this difficulty was soon got rid of through the influence of the Duke of York, the patron of the institution; and in August, 1822, Mr. Irving commenced his clerical duties as minister.

Few sights could have been more interesting than the growth of his popularity from such a small grain of mustard-seed. On the first day he seemed daunted as he stepped from the vestry to ascend the pulpit, at the array of empty seats before him, and the very scanty number of his congregation; he had never seen the like in Scotland, and for a moment he turned pale: this, then, was his sphere of action, upon which he had prepared to enter with such tremulous hopes and fears! Besides this, his church, by its locality alone, was most unlikely to force itself upon public notice, being situated in an unknown and untrodden street, upon the very edge of the Alsatia of Saffron Hill and Fleet Ditch; and, as if this was not enough, the building itself was at the extremity of an obscure court off the street, where no one, however curious, would have been likely to search for a place of worship. And yet his four Sabbaths of probation had not passed when there was a perceptible change. Strangers who happened to stroll into Cross Street in the course of their Sunday wanderings passed an open gate, and were arrested by the far-off tones of a deep, rich, solemn voice, that came like distant music to the ear; and on crossing the court with cautious steps, and peeping into the church, they saw a colossal man, of about six feet three, who, in this heart-subduing tone, and with commanding impressive gestures correspondent to the voice, was addressing them in a style of appeal such as they had never heard before. Could they retreat and walk idly away?—it was impossible; and therefore they sat down, and listened entranced, while the next Sabbath and the next was sure to find them returning, until they became a part of the flock. And it was not enough that they were themselves delighted; they must have others also either to share in their delight or justify their preference; so that every new comer brought his kinsfolks and acquaintances to hear this wondrous style of pulpit oratory. Thus the congregation grew with a rapidity that in a few weeks filled the building. But here the popular admiration did not pause. The strange advent in Hatton Garden attracted the notice of journalists; reporters from every metropolitan paper hurried to the spot; and in consequence of their published manifestoes, the fashion, the literature, and the sight-seeing spirit of London were roused to their inmost depths, and borne onward to the hitherto unknown region of Hatton Garden. On the Sabbath morning Cross Street was filled—nay, wedged—with crested and coroneted carriages; and a torrent of lords, senators, and merchant-princes, of duchesses and ladies of fashion, might be seen mingled pell-mell with shopkeepers and mechanics, all sweeping

across the open court, so that the church was filled in a twinkling; while disappointed hundreds pressed towards the porch, and clustered like bees round the open windows, to catch the swelling tones of the speaker, even if his words should be inaudible. It was a sudden growth—was it to pass away as suddenly? When mere curiosity is thus agog, the only question is, with how many trials will it rest satisfied.

We must now turn to the object of this dangerous experiment to Mr. Irving himself. Even at his earliest entrance into Glasgow he had shown that he was no ordinary man. But he had done more, for he had shown his determination not to be confounded with ordinary mortals. Even his conversation, therefore, as well as his style of preaching, was evidently with the aim to astonish; and he was not satisfied with a striking idea unless it was also arrayed in striking language. And this aim, so faulty in a common orator, but absolutely sinful in a preacher, instead of being repressed, was nourished into full growth in London, amidst the hot atmosphere of his new popularity; so that his pulpit style assumed a luxuriance and rankness such as no oratory of the day could parallel. It was the language of the sixteenth century engrafted upon the nineteenth; the usages, the objects, and the wants of the present day embodied in the phraseology of a long-departed style of life. The same aiming at singularity was perceptible in his attitudes, which disdained the simple rules of elocution; in his dress, which imitated the primness of the ancient Puritans; and even his dark shaggy locks, which he kept unpruned until they rivalled the lion's mane, and from which he was wont to shake warnings of most ominous significance. He had gone to London with the determination of being noticed, admired, and wondered at; and all this was but the fulfilment of his purpose. Gladly, however, we reverse the picture. In the first place, this *outré* manner, which would have sat so ludicrously upon any ordinary man, was in him so set off by his appearance, that, while the many delighted in it as something rich and new, the fastidious and the critical suspected that after all it was nothing more than the true natural expression of such a singular personage. In this way even the sesquipedalian words and rolling sentences of his oratory were in full keeping with the deep thunder of his voice and majestic swing of his arm; while the most startling of his assertions were enforced by the singular squint of one of his eyes, that rivetted the attention with a sort of mesmerism power. But better far than all this, there was a fertility and richness of mind in Mr. Irving that would have made him remarkable under any circumstances; so that, while he imitated the ancient masters of England in his quaint phraseology, and stern abrupt simplicity, he resembled them in the more valuable qualities of profound thought, vivid imagination, and fearless uncompromising honesty as a preacher of the Word. It was evident, in short, that while he wished to be an Elijah the Tishbite or John the Baptist, he was also animated by their righteous intrepidity, that would utter the most unpalatable truths, let them be received as they might. But was a crowded gay metropolis, instead of the wilderness, a fit place for such a John or Elijah? We shall soon see.

Hitherto Mr. Irving had not been known as an author; his only production from the press which he acknowledged being a farewell discourse to the congregation of St. John's at his departure to London. He was now, however, to give the public an opportunity of testing his powers, and ascertaining whether the popularity that crowned him had been justly be-

stowed. He had scarcely been a year in London when he published a collection of sermons in a closely printed octavo volume of 600 pages. These discourses, which had already been preached in Haddon Garden, he afterwards prepared for the press; and as no ordinary title-page was sufficient for him, the work was thus inscribed, *For the Oracles of God, Four Orations: for Judgement to Come, an Argument in Nine Parts.* They were not sermons, he wished them to be considered something better; and the quaint title with which they startled the first glance of the reader had cost him no little deliberation. And yet they were sermons after all. It must be acknowledged, however, that as such they were no ordinary productions; for with all their literary faults and oddities, they contained an amount of rich original thought and stirring eloquence such as few pulpit productions of the present day can exhibit. This was indeed apparent at the first opening of the volume, where the following magnificent exordium caught the eye and rivetted the attention. It would be difficult, however, to conceive its full power when it was first delivered in the pulpit, and when it pealed upon the ears of the congregation like the stately solemn sound of a church-organ uttering the notes of the *Tu Deum*:—

"There was a time when each revelation of the Word of God had an introduction into this earth which neither permitted men to doubt whence it came nor wherefore it was sent. If, at the giving of each several truth, a star was not lighted up in heaven, as at the birth of the Prince of truth, there was done upon the earth a wonder to make her children listen to the message of their Maker. The Almighty made bare his arm, and through mighty acts shown by his holy servants gave demonstration of his truth, and found for it a sure place among the other matters of human knowledge and belief.

"But now the miracles of God have ceased, and nature, secure and unmolested, is no longer called on for testimonies to her Creator's voice. No burning bush draws the footsteps to his presence chamber; no invisible voice holds the ear awake; no hand cometh forth from the obscure to write his purposes in letters of flame. The vision is shut up, and the testimony is sealed, and the word of the Lord is ended; and this solitary volume, with its chapters and verses, is the sum total of all for which the chariot of heaven made so many visits to the earth, and the Son of God himself tabernacled and dwelt among us."

The announcement of a work from the press by the Rev. Edward Irving acted upon the critics as a view-halloo does upon a band of huntsmen beating about for game, but at a loss as to its whereabouts. As yet they had got nothing but the tidings of the diurnals, and the scraps of the penny-a-liners, which they had regarded as the mere yelping of the curs of the pack; but now the start was made in earnest, and off went the hunters in full cry. Never, indeed, had a volume of sermons, even from Chalmers himself, excited such a stir, and every review was immediately at work, from the Jupiter Tonans of the quarterly, to the small shrill whistle of the weekly periodical. And never, perhaps, on any one occasion was criticism so perplexed and contradictory, so that Mr. Irving was represented as the truest of talented men and the most deceptive of quacks—a profound thinker and a shallow smatterer—a Demosthenes of the real sublime, and a Bombastes Furioso of mere sound and nonsense. It often happened, too, that the very same paragraphs which were quoted by one set of critics as masterpieces of eloquence, were adduced by another class to prove that his oratory was nothing

but sheer noise and emptiness. And whereabouts lay the truth? With both parties. Scarcely was there an excellence attributed to him which he had not manifested, or a defect of which he had not been guilty; and the work itself, after the personal interest excited by its author had passed away, was dispassionately tried, and in spite of its manifold excellencies consigned to oblivion. As it was, however, such was its immediate reception, that six months after its appearance a third edition was in demand, which he prepared accordingly, with the following defiance to his reviewers in the preface:—

“I do now return thanks to God that he hath saved these speculations (whatever they be) from the premature grave into which the aristocracy of criticism would have hastened them; and that two large editions are now before the world, which can judge for itself whether the work be for its edification or not. I have been abused in every possible way, beyond the lot of ordinary men, which, when I consider the quarters whence it hath come, I regard as an extraordinary honour. I know too well in whom I have believed to be shaken by the opposition of wits, critics, and gentlemen of taste, and I am too familiar with the endurance of Christians, from Christ downwards, to be tamed by paper warfare, or intimidated by the terrors of a goose-quill. Even as a man I could have shaken a thousand such unseen shapeless creatures away from me, and taken the privilege of an author of the old English school, to think what I pleased, and write what I thought; and most patiently could I have borne exile from the ranks of taste and literature, if only the honest men would have taken me in. But as a Christian, God knoweth, I pray for their unregenerate souls, and for this nation which harboureth such fountains of poison, and is content to drink at them. Their criticisms show that they are still in the gall of wickedness and the bonds of iniquity, and I recommend them once more to look unto themselves, and have mercy upon their own souls.”

But the head and front of Mr. Irving's literary offences, and the chief subject of merriment or condemnation with his judges, had been his antiquated style of English—his obvious imitation of the great masters of the sixteenth and seventeenth centuries. Upon this point, therefore, he was most earnest to defend himself; and for this purpose he states that Hooker, Taylor, and Baxter in theology—Bacon, Newton, and Locke in philosophy—and Shakspeare, Spencer, and Milton in poetry, had been the chief objects of his study. “They were the fountains,” he adds, “of my English idiom; they taught me forms for expressing my feelings; they showed me the construction of sentences, and the majestic flow of continuous discourse. I perceived a sweetness in every thought, and a harmony in joining thought to thought; and through the whole there ran a strain of melodious feeling which ravished the soul, as vocal melody ravisheth the ear. Their books were to me like a concert of every sweet instrument of the soul, and heart, and strength, and mind. They seemed to think, and feel, and imagine, and reason all at once; and the result is to take the whole man captive in the chains of sweetest persuasion.” Having thus, as he opines, completely exonerated himself by such sacred examples, Mr. Irving again turns with tenfold ardour upon those thoughtless critics who, in pronouncing his condemnation, had condemned not only him, but the honoured company in which they found him. The following is but a portion of his terrible objurcation:—

“*They are not always in taste!*” But who is this taste, and where are his works, that we may try what

right he hath to lift his voice against such gifted men? This taste, which plays such a part in these times, is a bugbear, an ideal terror, whose dominion is defended by newspaper scribblers, reviewers, pamphleteers, and every nameless creature. His troops are like king David's: ‘Every one that is in distress, every one that is in debt, every one that is discontented.’ And what are his manifestoes?—paragraphs in the daily papers, articles in magazines, and critiques in reviews. And how long do they last?—a day, a week, a month, or some fraction of a year—aye and until the next words of the oracle are uttered. And what becomes of the oracles of the dreaded power?—they die faster than they are born; they die, and no man regardeth them.”

Such was but one specimen among many of the magnificent disdain with which Mr. Irving could trample down whatever withstood him in his career. Strong in the uprightness of his own purpose, and with his eye exclusively fixed upon the goal, he regarded everything that crossed his path as an unhalloed obstacle, and treated it accordingly. It need not be added, that his critics whom he chastised so roughly, were by no means disposed either to accord with his views, or submit in silence to the scorn with which he elbowed them aside; and, accordingly, they treasured up the injury for future count and reckoning. In the meantime two events important in the life of a clergyman had taken place with Mr. Irving. The first was his marriage. It will be recollected that, when a mere stripling, he had been settled at Kirkcaldy, where he not only taught in the academy, but gave lessons as a private tutor in the town. One of his pupils was Miss Isabella Martin, daughter of the Rev. John Martin, one of the ministers of Kirkcaldy; and between this young couple, so employed, a mutual attachment sprang up, which led to an engagement of marriage as soon as the unpatronized teacher should be provided with a living. Mr. Irving never lost sight, amidst the uncertainties that followed, and the blaze of beauty and fashion by which he was afterwards idolized in London, of the sacred compact of his youthful days; and accordingly, as soon as he was permanently settled in the metropolis, he hid down to Kirkcaldy, and returned with his long-expecting bride. Stories, of course, were rife at the time of more than one lady of rank and fortune who would willingly have taken her place, to be the partner of such a goodly man, and eloquent widely-famed divine. The other event was the building of a new church for the crowds that had settled under his ministry. The chapel in Hatton Garden, which, at his arrival, did not muster more than fifty hearers, had, at the end of three months, about fifteen hundred applicants for church-sittings, although the building could scarcely have accommodated half the number. And this, too, irrespective of the unnumbered crowds that thronged round the walls, unable to find standing-room, or even a footing upon the threshold. The necessity of a larger building was urgent, and preparations were promptly adopted, which were so successful that the Scotch National Church in Regent Square was commenced, which was finally completed in 1829—a stately building, capable of accommodating at least 2000 persons.

In the meantime, how fared the popularity of Edward Irving? A “nine-days' wonder” has generally a still shorter date in London, and he who can sustain it beyond that point must have something within him worth more than merely to be wondered at. Mr. Irving's, however, continued, with little visible abatement, for nearly two years; and although much of this was owing to the fact that only a limited

number could hear him at one time, while myriads waited for their turn, much was also owing to his solid sterling qualities, about which there could neither be controversy nor mistake. His peculiarities were innumerable, from the stilted style of his oratory down to the squint of his eye; while each was the subject of discussions innumerable, both in conversation and print. And yet, with all this, one fact was incontestable, which was, that he was the most eloquent and original preacher in London, and this even his maligners were compelled to confess. But, unfortunately, a fault was growing upon him for which no human eloquence can atone. He was now becoming prolix—prolix to a degree which no mortal patience, in modern life at least, can well endure. It was not unusual with him to give an opening prayer of an hour long, and follow it by a sermon that took at least two hours in the delivery. This, too, was not only in the earlier part of the day, but in the evening also. It was a trial which mere hunters in quest of pulpit popularity could not sustain, and therefore the crowd melted away, and left him in undisturbed possession of his own regular auditory. And even they, too, much as they admired and loved him, were growing restive at services by which their attention was worn out and their domestic arrangements subverted. But this Mr. Irving could not understand; with him it was enough that what he felt it his duty to preach, it was the duty of his people to hear. The tide had reached its height, and the ebb was commencing. Such was the state of matters when he was invited to preach the anniversary sermon of the London Missionary Society, in May, 1824. He complied, and on the 14th he preached in Tottenham Court Chapel, on Mat. x. 5-42. He was still, with every drawback, by far the most popular preacher in London; so that, notwithstanding a heavy continued rain, the spacious building was filled at an early hour. But on this occasion he outdid even his wonted prolixity. Twice he was obliged to rest in the delivery of his almost interminable sermon, during which the congregation sang a few verses of a hymn; and when it was published it occupied 130 large and closely printed pages, while the dedication and preface bulked the volume into thirty pages more.

But faults more serious than that of lengthiness pervaded this unfortunate discourse, and made Mr. Irving's best friends wish that it had been unpublished, and even unpreached. It was his practice, like other men of ardent minds, to see too exclusively, and condemn too unsparingly, whatever error he detected; and the exaggerated language which he used on such occasions was more fitted to irritate than persuade. Such was his fault in the present instance. He thought there was too much secularity and self-seeking in the management of missions, and was impatient to announce the fact and point out a better mode of action; but wound up exclusively in this one idea, his discourse looked too much like a violent condemnation of all modern missionary enterprise whatever. After having sorely handled the missionary directors, and the missionaries themselves, as if they had been mere hucksters of religious truth, and sordid speculators, who thought of nothing pertaining to the sanctuary but its shekels, he proceeded to propound the remedy. And this was tenfold more extravagant than his exposure of the offence. All money provision for missions was to be foregone, and all prudential considerations in their management given to the winds. Missionaries were to be considered as the veritable successors of the seventy, and, like them, therefore, were to be sent forth without money and without scrip. It was enough for

them that they were to be wafted to their destination, and thrown upon its shores, after which they were to go forward nothing doubting. The world had been thus converted already, and thus it would be converted again. He forgot that the seventy were sent on this occasion, not into heathen and savage countries, but to the towns and villages of their own Judea; while their commission was simply to announce their Master's coming, and prepare the people for his arrival. This, however, was not enough for Mr. Irving. His missionary must go forth in faith, without a farthing for his journey, or even a purse to hold it. It was only by thus making himself nothing that the sacred cause could become all in all; and in proportion to his trials and necessities would be the greatness and number of the miracles by which he would be assuredly relieved. Who does not see in all this the germ of that strange system of religious error of which Mr. Irving was afterwards the hierophant? Becoming every day more impatient of the world of reality, he was hungering and thirsting for miracles; and these any man whatever in such a mood is sure either to make or find. But another fact almost equally significant in this published sermon, or, as he called it, "oration," was its dedication to S. T. Coleridge, a man certainly of rich original mind and splendid endowments, and yet not the fittest guide for so enthusiastic a theologian as Mr. Irving. But the latter thought otherwise; and, discarding all his former preceptors, he now sat at the feet of this eloquent mystic, in the new character of a silent, humble listener.

The signals of a downward course had thus been given, and the thoughtful friends of Mr. Irving looked on with sad anxiety. His popularity also was wearing out, and he might be tempted into some strange measure to revive it. A change was evidently at hand, but what was to be its commencement? As yet he was unprepared for a departure from his old standards, or the promulgation of a new doctrine. But the field of prophecy lay temptingly in his way—that field which has been common to expositors for eighteen centuries, and in which every one has been held free to entertain his own opinion. Here, then, lay the allurements, and for this also he had for some time been unconsciously under a course of training. In 1824 he had met, in company, Mr. Hatley Frere—a gentleman whose mind was much employed in the exposition of the book of Daniel and the Apocalypse, and by whom he was asked to take a walk into the fields on the breaking up of the party. As they strolled along, Mr. Frere took the opportunity of expounding his views on the fulfilment of prophecy, and found in Irving a willing auditor. After a year they again met, when the subject was resumed, and Irving listened with the same docility which he was wont to bestow upon Coleridge. He had now found a new guide to direct as well as a new theme to interest him. Thus stood matters when he was invited to preach the anniversary sermon of the Continental Society in 1825. And will it be believed that, on this occasion, he plunged right downwards into a new interpretation of prophecy? A few conversations with Frere, who, as he thought, had furnished him with the right key, and his own miscellaneous readings upon the subject, were enough to qualify him as a guide upon a path where so many thousands had erred! The "oration," as may well be supposed, was perplexing in the extreme; and while some of his audience thought that he was advocating Catholic emancipation, others thought that he was battling against it. Some of the leading members of the committee had not even patience to

wait the issue of the question, but left the church before the sermon was finished. To set himself right with the public, as well as announce his new interpretation, Mr. Irving published the substance of this sermon, which swelled, as he wrote, into a work of voluminous bulk, under the title of *Babylon and Infidelity Foredoomed of God*. He was the first expositor who ventured to connect particular predictions with the events of the French Revolution. According to him, the Papacy commenced in A.D. 533, which, with the 1260 prophetic days or years of its continuance, brings Popery down to the year 1793, the year when the French Revolution commenced, at which date Mr. Irving considers the reign of Popery to have been superseded by that of Infidelity, and the judgments upon Babylon to have commenced. From that period to the date of his preaching, comprising a period of thirty years, six vials, as he imagined, had been poured out upon the seat of the Beast. The seventh and last vial, which was reserved for the destruction of infidelity, he calculated would occupy forty-five years more, thus bringing the consummation of judgment to the year 1868, when the millennial kingdom was to commence on earth, with Christ himself, and in person, as its sovereign.

Such is but a brief sketch of that system expository of the fulfilment of prophecy into which Irving now threw himself with headlong ardour, and of which he talked as if it were the sum and substance of revelation. His pulpit rang with it, and with it alone; his whole conversation was imbued with it; and while his fervent imagination revelled with almost superhuman excitement among pictures of Armageddon and the millennium, the Inferno and Paradiso of his preaching, his finger incessantly pointed to the year 1868 as the date emblazoned upon the heavens themselves, at which all old things were to pass away, and all things become new. And with what desire he longed to live to this year, that he might behold its glories with his own bodily eyes! Besides his work, also, of *Babylon and Infidelity Foredoomed of God*, his active pen was soon resumed upon the same subject. In the course of his studies on the completion of prophecy, he had met with a production that in some measure accorded with his own views. This was a large work written by a Spanish ecclesiastic, who shrouded his liberal and Protestant sentiments under the character and name of a Jewish convert, to escape a controversy with the Inquisition; and, deeming it well worth the notice of the British public, Mr. Irving immediately studied the Spanish language, translated the volume into English, and published it in 1827 under the title of *"The Coming of the Messiah in Glory and Majesty, by Juan Josafat Ben Ezra, a Converted Jew."* It was not long before his zeal and eloquence procured many converts to his opinions, who held their stated meetings at Albury, near Guildford, in Surrey, in the mansion of Mr. Drummond, the banker, a warm friend and coadjutor of Mr. Irving. The result of these meetings was given to the world by Mr. Drummond, in three volumes, entitled *Dialogues on Prophecy*. A quarterly periodical, also, called the *Morning Watch*, was soon commenced by the "Albury School of Prophets" and their supporters, in which their peculiar views about prophecy and the millennium were advocated and illustrated with great talent and plausibility.

Well would it have been for Mr. Irving if he had now stopped short. As yet his views, if eccentric, had been comparatively harmless; and even if his calculations had been erroneous, he had only failed in a subject where such men as Bacon, Napier, Sir

Isaac Newton, and Whiston had been in fault. But here he could not stop. He had commenced as an independent expounder of prophecy, and he must needs be the same in doctrine also. It was about the year 1827 that he was observed to preach strange sentiments respecting the human nature of our blessed Redeemer, as if the Holy One, while on earth, had been peccable like any son of Adam, although completely sinless in thought, word, and deed. It may be that his ideas of the second advent of Christ in 1868, and the nature of the millennial reign which was then to commence, had thus secularized and degraded his conceptions respecting the second person of the Godhead. His first public announcement of these most culpable opinions was before the London Society for the Distribution of "Gospel Tracts," in whose behalf he preached a collection-sermon. Many of his hearers were astonished, and not a few shuddered. He still continued to preach upon the same subject, at every step entering into additional error, until a heresy was fully organized, which he fearlessly published to the world in 1828, in a work of three volumes, closely printed in octavo, entitled *Sermons, Lectures, and Occasional Discourses*. These discourses, and his new creed, one might think, should have been immediately followed by trial and deposition. But heresy is a difficult subject even for the grasp of a church-court, as it does not always wear a sufficiently tangible and specific form. Besides, it was not always easy, from Mr. Irving's language, to ascertain the full amount and nature of his meaning. On every subject he spoke as if there was no degree of comparison but the superlative. He soon, however, received a silent but significant warning. Having gone down to Scotland in 1829, he was desirous of the honour of a seat in the General Assembly, and was nominated a ruling elder for that purpose by his native burgh of Annan. But the Assembly refused the appointment. His heretical sentiments were already too well known, and would of themselves have been sufficient for his rejection. But the refusal of the venerable court was founded upon a more merciful principle; as a non-resident in the kingdom of Scotland, and as an ordained minister beyond its bounds, he could not at that time take his seat as a ruling elder among them. During this tour Mr. Irving was not otherwise unoccupied; and in Dumfries and its neighbourhood he preached in the open air, and in a style that astonished his sober-minded countrymen. His sermons on these occasions comprised all his errors in doctrine, and all his singularities of exposition, from the downfall of Popery and the peccability of our Saviour's human nature, to the millennial reign and the restoration of all things, whether animal, vegetable, or mineral—from man, the lord of creation, to the crawling worm or the senseless stone.

But even farther yet Mr. Irving was to go. A strange religious frenzy had commenced at Row and Port-Glasgow, on the Firth of Clyde, engendered by extravagant notions about the assurance of faith and universal redemption, under which several weak minds became so heated, that they began to prophesy and attempt to work miracles. But the most remarkable part of the delusion consisted in wild pythonesque contortions into which the favoured of the sect were thrown, under which they harangued, raved, and chanted in strange unintelligible utterances that were asserted to be divine inspiration, speaking miraculously in languages which neither speaker nor hearer understood. It was a craziness as contemptible as that of the Buchanites in the preceding century, and, like the system of Elspeth Buchan, it was unsuited for a permanent hold upon

the Scottish intellect; so that, while its action was chiefly confined to hysterical old women and dreaming girls, it fell into universal contempt, and passed away as rapidly as it had risen. But just when this moon-governed tide was at the height, one of its female apostles went to London, and connected herself with Mr. Irving's congregation, many of whom were fully ripened for such extravagances. They were wont to assemble for prayer-meetings and religious exercises at the early hour of six in the morning, and there the infection spread with electric rapidity, while prophesying, denouncing, and speaking in unknown tongues took the place of prayer and exhortation. As in the cases of Row and Port-Glasgow, also, these visitations at first were chiefly confined to the female sex, and a few unlucky men, the victims of feminine susceptibility. But the London form of the disease soon took a higher flight than that of Scotland. Private rooms and session-houses were found insufficient for such important manifestations, and they were daringly transferred to the church, and incorporated with the solemn public services? And how could the spirit of Mr. Irving brook such arrogant interruptions? But, alas! the lion within him was tamed, cowed, and chained; and he who daringly sought to be more, was now less than man. He believed that the second pentecostal day had come, of which the first was but a type; that these were the divine supernatural manifestations by which the second coming and reign of Christ upon earth were to be heralded; and that himself the while was the honoured John the Baptist, by whom the coming had been heralded and the way prepared.

These were proceedings which the church could no longer tolerate, and the case was taken up by the London presbytery in the early part of 1830. As yet the charge brought against him was only that of heresy—one, as we have already mentioned, so difficult to substantiate, and therefore the discussion was prolonged for eighteen months without any final result. But during the interval the excesses at the Caledonian Church, Regent Square, had become so wild, and withal so notorious, that the question of his offence was no longer one of nice metaphysical subtlety. These were matters of fact, not of mere opinion, and soon received from the depositions of examined witnesses their full amount of proof. It is to be observed that, for some time, Mr. Irving had been in the practice of exalting the authority of the church as paramount and supreme, while by the church he meant the ministers and office-bearers exclusively, in their courts assembled for the purposes of ecclesiastical legislation. Their dictates were infallible, and therefore to be received without disputation or scruple. It was the system of his favourite Hooker pushed into the extremes of Puseyism, and even of downright Popery. According, therefore, to his own teaching, he should have accepted the presbytery's award with implicit submission. But it happened with him, in his own case, as it has done with many others, that this particular instance was an exception to the general rule. His light and knowledge, his vocation and labours, were superior to those of his brethren; they were working and blundering in darkness, upon subjects which they were not worthy to comprehend; and how, then, could they be qualified to judge in such a case as this? This, his conclusion, was apparent in his conduct during the course of trial. He lost patience during the cross-examination of the witnesses, and charged the presbytery with being a "court of Antichrist." His defence, which occupied four hours in the delivery, was more the language of denunciation and rebuke than confession or exculpation; it was

even a fierce defiance and full rejection of presbyteries, synods, and general assemblies to boot, when they came in contravention with himself and his kirk-session. The result of this trial was, that he was found guilty of the charges libelled against him, and sentenced to deposition from his local cure as minister of the Scotch National Church in Regent Square. Regarding, or pretending to regard, this sentence as a mere nullity, he attempted to hold his early morning meetings in that building as before; but when he presented himself with his followers for that purpose, he found the gates locked, and all access refused. True to his new character, he uttered an awful prophetic denunciation at this rejection, and turned away in quest of another place of meeting.

This was but the first step of Mr. Irving's ecclesiastical punishment; for, though deprived of his church, his standing as a minister of the Church of Scotland was still untouched. The question whether he should thus continue was, therefore, to be next tried before the bar of that presbytery by which he had been ordained—the presbytery of his native Annan. This ecclesiastical assize was held on the 13th of March, 1833, and Mr. Irving appeared at the summons. His conduct on this occasion was, if possible, still more wild, as well as more peremptory, than it had been before the presbytery of London. The most serious part of his offence was now to be taken into account; and therefore the charge against him was, of "printing, publishing, and disseminating heresies and heretical doctrines, particularly the doctrine of the fallen state and sinfulness of our Lord's human nature." His answer was rather an authoritative harangue to the by-standers, justifying his doctrine, and commanding them to receive it, than the reply of an office-bearer to his court of judicature; and at the conclusion he wound up his rebellion in the following words: "I stand here, not by constraint, but willingly. Do what you like. I ask not judgment of you; my judgment is with my God; and as to the General Assembly, the spirit of judgment is departed from it. Oh! ye know not how near ye are to the brink of destruction. Ye need not expedite your fall. All are dead around. The church is struggling with many enemies, but her worst is within herself—I mean that wicked Assembly!" After full trial he was found guilty, and the sentence of deposition was just about to be prefaced with prayer, when a loud voice was heard from a pew behind Mr. Irving, exclaiming, "Arise, depart!—arise, depart!—flee ye out, flee ye out of her! Ye cannot pray. How can ye pray? How can ye pray to Christ, whom ye deny? Ye cannot pray. Depart—depart—flee—flee!" The church, at this late hour, was almost enveloped in darkness; and the crowd of 2000 people within the walls started to their feet, as if the cry of "Fire!" had been suddenly sounded. But a minister, on lifting up the solitary candle to which they were reduced, and searching cautiously about, discovered that the words were uttered by Mr. Dow, late minister of Irongray, who had been deposed for holding sentiments similar to those of Mr. Irving. The latter, who seemed to consider the call as a command from Heaven, rose up to depart; and turning his colossal form toward the passage, which was almost blocked up, he thundered in a tone of impatience, "Stand forth! Stand forth! What! Will ye not obey the voice of the Holy Ghost? As many as will obey the voice of the Holy Ghost, let them depart." He strode onward to the door, and, pausing for a moment, he exclaimed—"Prayer indeed! Oh!" Such was his parting salutation to the church of which he had been so distinguished a minister. In a few minutes more the sentence of

the presbytery was pronounced, and his connection with the church dissolved.

The subsequent history of an individual so good and talented, but whose course withal was so erratic, may be briefly told. Immediately after his deposition, he commenced a tour of open-air preaching in Annan, Dumfries, and other places, and then returned to London. On his ejection from the Caledonian Church in Regent Square, he had settled, with a great portion of his congregation, who followed him, in a building in Newman Street, formerly the picture-gallery of Benjamin West, which was fitted up for a place of worship; and here, completely removed beyond the control of church-courts, Mr. Irving gave himself up to his prophets and prophetesses, whose exhibitions became wilder and revelations more abundant than ever. A new creed, a new church, and new office-bearers and rites were soon established; itinerant preachers were sent forth to proclaim the advent of a better world at hand, while miracles, effected upon the weak-minded and hypochondriacal, were announced as incontestable proofs of the divine authority of the new system. At length 50,000 worshippers, and numerous chapels erected throughout England, proclaimed that a distinct sect had been fully established, let its permanency be what it might. And now Mr. Irving had attained that *monstrari digito* which, with all his heroic and disinterested labours, he never appears to have lost sight of since his arrival in London. But as the honoured and worshipped mystagogue, with a church of his own creation, was he happy, or even at peace with himself? His immeasurably long sermons, his frequent preachings and writings, his incredible toils both of mind and body, were possibly aggravated and embittered by the apostasy of some of the most gifted of his flock, and the moral inconsistencies of others; while the difficulties of managing a cause, and ruling a people subject to so many inspirations, and exhorted in so many unknown tongues, would have baffled Sir Harry Vane, or even Cromwell himself. His raven locks were already frosted, and his iron frame attenuated, by premature old age; and in the autumn of 1834 he was compelled to return to his native country for the recovery of his health; but it was too late. His disease was consumption, against which he struggled to the last, with the hope of returning to his flock; but on arriving at Glasgow, his power of journeying was ended by the rapid increase of his malady; and he was received under the hospitable roof of Mr. Taylor, a stranger, where, in much pain and suffering, he lay down to die. In his last hours he was visited by his aged mother, and his sister, Mrs. Dickson, to the first of whom he said, "Mother, I hope you are happy." Much of the time during which he was sensible was employed by him in fervent prayer. A short time before he expired, the Rev. Mr. Martin, his father-in-law, who stood at his bed-side, overheard him faintly uttering what appeared a portion of the twenty-third psalm in the original; and on repeating to him the first verse in Hebrew, Mr. Irving immediately followed with the two succeeding verses in the same tongue. Soon after he expired. This event occurred on the 6th of December, 1834, when he was only forty-two years old. His death occasioned a deep and universal sensation in Glasgow, where his ministry as a preacher had commenced, and where he was still beloved by many. He left a widow and three young children, one of them an infant only six months old at his decease.

IVORY, JAMES, LL.D.—This excellent mathematician was born at Dundee in 1765. After he

had attended the public schools of his native town, until the usual course of an English education was finished, his father, who was a watchmaker in Dundee, being anxious that his son should be a minister, sent him to the university of St. Andrews, to prosecute those studies which the church has appointed. He entered the college at the age of fourteen, and continued there six years; but of the various departments of study comprised within this course, mathematics attracted his chief attention; and in this he made such proficiency as to attract the notice of his fellow-students, as well as of the Rev. John West, one of the professors, who encouraged and aided him in his scientific pursuits. After these college terms had been finished, Ivory spent two years at St. Andrews in the study of theology, and a third in Edinburgh, where he had Sir John Leslie for his class-fellow. But on completing his theological course, and leaving the university, in 1786, instead of becoming a licentiate of the church, as his father had proposed, he became assistant teacher in a newly established academy in Dundee, where he continued three years, and afterwards engaged with some other persons in a factory for spinning flax, which was erected at Douglstown, Forfarshire. How this last occupation, of which he was chief superintendent, coincided either with his previous studies as a theologian, or his predilections as a mathematician, does not distinctly appear; but the result was a failure; for, after fifteen years of trial, the company was dissolved in 1804, and the factory closed. During all this period Ivory had probably employed his leisure in the study both of English and foreign works upon his favourite science—pursuits not of a favourable nature certainly for the mechanical operations of flax-spinning. He had done enough, however, at all events, to show that his leanings were not towards the office of the ministry.

The next change that Mr. Ivory underwent was of a more congenial character, for it was to a professorship of mathematics in the Royal Military College, instituted a few years previous at Marlow, in Buckinghamshire. Here he laboured with great assiduity in his new charge, and afterwards at Sandhurst, Berkshire, when the college was removed to that quarter. The manner in which he discharged the duties of his important professorship not only met with the high approval of the governor of the institution, but also the cordial esteem of the students, whom he was never weary of instructing in a science so essential to the military profession. He endeavoured, in his lessons, to simplify those demonstrations that had hitherto been of too complex a character; and for the more effectual accomplishment of this purpose he also published, but without his name, an edition of Euclid's *Elements*, in which the difficult problems were brought more within the reach of ordinary understandings. So earnestly and indefatigably, indeed, were these duties discharged, that in 1819 his health unfitted him for further public exertion, and he resigned his chair in Sandhurst College before the time had elapsed that entitled him to a retiring pension. But the value of his services was so justly estimated, that the full pension was allowed him, with which he retired into private life, in or near London, where he prosecuted his favourite studies till the period of his death, which occurred on the 21st September, 1842, in the seventy-seventh year of his age.

Such were the few events of a public nature that characterized the life of Professor Ivory; but his actions are chiefly to be found in his scientific writings, which were highly estimated by the mathe-

mathematicians of his day. Of these we give the following brief enumeration:—

In 1790, 1799, and 1802 he sent three communications to the Royal Society of Edinburgh. The first of these was entitled *A New Series for the Rectification of the Ellipse*; the second, *A New Method of Resolving Cubic Equations*; and the third, *A New and Universal Solution of Kepler's Problem*.

To these succeeded, between the years 1809 and 1839, fifteen papers, transmitted to the Royal Society of London, and published in their *Transactions*. The first of these, *On the Attractions of Homogeneous Ellipsoids*, possesses remarkable merit, in which he solved, in a new and simple manner, the attractions of these ellipsoids upon points situated on their exterior. Three of these were on the *Attractions of Spheroids*, in which he substituted a process of analysis so much superior to that of the celebrated Laplace, that the latter frankly acknowledged the superiority. Another communication, published in the *Transactions* for 1814, is entitled *A New Method of Deducing a First Approximation to the Orbit of a Comet from Three Geocentric Observations*. Two of the articles contain his investigations on the subject of astronomical refractions; and four on the equilibrium of fluid bodies. These titles will suffice to show the subjects that chiefly

occupied his attention. Only one of these papers was purely mathematical, and was entitled *On the Theory of Elliptic Transcendents*.

The honours that were conferred upon a silent recluse student, such as Mr. Ivory was, showed how greatly his scientific acquirements and his writings were valued. In 1814 the Copley medal was awarded to him for his mathematical communications to the Royal Society; in 1826 he received one of the royal medals for his paper on *Astronomical Refractions*, published in 1823; and in 1839 another royal medal was bestowed on him for his *Theory of Astronomical Refractions*, which was published in the previous year. In 1815 he was elected a fellow of the Royal Society of London; he was also an honorary fellow of the Royal Society of Edinburgh, of the Royal Irish Academy, and of the Cambridge Philosophical Society; a corresponding member of the Institute of France, of the Royal Academy of Sciences of Berlin, and of the Royal Society of Göttingen. In consequence of a recommendation of Lord Brougham to William IV., Mr. Ivory, in the year 1831, was honoured with the Hanoverian Guelphic order of knighthood, and a pension of £300 per annum; and in 1839 he received the diploma of Doctor in Laws from the university of St. Andrews.

J.

JACK, or **JACHÆUS**, GILBERT, an eminent metaphysician and medical writer, and professor of philosophy at Leyden, was born at Aberdeen, as has been asserted (although there seems but slight ground for fixing the date so precisely), in the year 1578. Early in life, and apparently before he had commenced a regular series of literary study, he lost his father, and was committed by his mother to the private tuition of a person named Thomas Cargill. He afterwards studied under Robert Howie: and as that individual was made principal of Marischal College on its erection into a university, in 1593, it is probable that Jack obtained a portion of his university education at Aberdeen, although he is mentioned by Freher as having studied philosophy at St. Andrews, where he was under the tuition of Robert Hay, an eminent theologist.¹ By the advice of his tutor, who probably detected in his mind the dawning of high talent, Jack continued his studies in the universities on the Continent. He remained for some time at the colleges of Herborn and Helmstadt, when, incited by the high fame of the university of Leyden, he removed thither and sought employment as a private teacher in expectation of eventually obtaining a professorship. His ambition was at length gratified by his appointment, in 1604, to what had been in general terms called the philosophical chair of that celebrated institution. Scotland, which seems to have acquired a permanent celebrity from the numerous persevering and ambitious men it had dispersed through the world, was at no time so fruitful in its supply of eminent men as during the lifetime of the subject of our memoir. Adolphus Vorstius, a person known to fame chiefly

from his tributes to the memory of some eminent friends, and colleague of Jack in the university of Leyden, in a funeral oration to his memory, from which the materials for a memoir of Jack are chiefly derived, mentions that at the period we allude to there was scarcely a college in Europe of any celebrity, which did not number a Scotsman among its professors: and whether from the meagre tuition in our own universities, or other causes, most of the Scotsmen celebrated for learning at that period—and they were not a few—began their career of fame abroad. In the works or correspondence of the continental scholars of the seventeenth century, we frequently meet with names of Scotsmen now forgotten in their native country, and that of Jack frequently occurs, accompanied with many indications of respect. He is said to have been the first who taught *metaphysics* at Leyden, a statement from which we may at least presume that he opened new branches of inquiry, and was celebrated for the originality of the system he inculcated. During his professorship at Leyden he studied medicine, and took his degree in that science in 1611.

In 1612 appeared his first work, *Institutiones Physicæ, Juventutis Lugdunensis Studiis potissimum dicatæ*, republished with notes in 1616. This treatise is dedicated to Matthew Overbegius (Overbeke), and is in the usual manner prefaced by laudatory addresses, which are from the pens of men of celebrity—Daniel Heinsius, Greek professor of Leyden (who appropriately uses his professional language), Gaspard Barlæus, the professor of logic at Leyden, and Theodore Schrevelius (probably father to the lexicographer Cornelius). This work, notwithstanding its title, will be readily understood to be generally metaphysical, and the portion tending to that species of discussion is that from which a modern student will derive most satisfaction. It consists of nine books. The first is introductory, containing

¹ *Freheri Theatrum Virorum Eruditione Clarorum*, ii. 1353. *Græcis utriusque lingue fundamentis, ad academiam Andream adlocutus, philosophiæ operam navavit, præceptore nam Roberto Hæzio Theologo exsilio.*

definitions, &c., the second is "De Natura," the third "De Motu," the fourth "De Tempore," the fifth "De Cælo," the sixth "De Corpore Misto," the seventh "De Meteoris," the eighth "De Anima," and the ninth "De Anima Rationali." Apart from the doctrines now called vulgar errors, for an adherence to which the limited bounds of our own knowledge must teach us to excuse our forefathers, this work may be perused with interest and even profit. To have departed from the text of Aristotle might have been considered equal in heresy to a denial of any of the evident laws of nature; but if Jack was, like others, a mere commentator on the great law-giver of philosophers, he frequently clothes original views in correct, clear, and logical language; his discussions on time and motion might not be ungrateful to a student of Hutcheson or Reid; and though almost unknown to his country, and forgotten in his native city, he is no contemptible member of the class of common-sense philosophers of whom Scotland has boasted. In 1624 Jack published another work, entitled *Institutiones Medice*, republished in 1631. About this period his celebrity had reached the British Isles; and, like his illustrious friend and comrade Vossius, the author of the *History of Pelagianism*, he was invited to fill the chair of civil history at Oxford, a proffer he declined. This eminent man died on the 17th day of April, 1628, leaving behind him a widow and ten children. He seems to have been on terms of intimate and friendly familiarity with the greatest men of the age. He is said to have been a hard student, to have possessed vast powers of memory, and to have been more attentive to the elegancies of life, and to his personal appearance, than scholars then generally were.

JACK, or JACHEUS, THOMAS, a classical scholar of eminence, and author of the *Onomasticon Poeticum*. The period of the birth of this author is unknown: Dr. M'Crie has with his usual industry made investigations into his history, but, excepting the circumstances to be discovered from the dedication to his work, none but a few barren facts have been found, which must have ill repaid the labours of the search. He was master of the grammar-school at Glasgow; but at what period he entered that seminary is unknown. He relinquished the situation in 1574, and became minister of the neighbouring parish of Eastwood, from which, in the manner of the time, he dates his book "ex sylva vulgo dicta orientali;" his work is entitled "*Onomasticon Poeticum, sive propriorum quibus in suis monumentis usi sunt veteres Poetæ, brevis Descriptio Poetica*;" it is neatly printed in quarto, by Waldegrave, 1592, and is now very rare. It may be described as a versified topographical dictionary of the localities of classical poetry, expressing, in a brief sentence seldom exceeding a couple of lines, some characteristic, which may remind the student of the subject of his readings. He mentions that he has found the system advantageous by experiment; and most of our readers will be reminded of the repeated attempts to teach the rules of grammar, and other matters necessary to be committed to memory, in a similar manner. The subject did not admit of much elegance, and the chief merit of the author will be acknowledged in the perseverance which has amassed so many references to subjects of classical research. A quotation of the first few lines may not be unacceptable:—

"Caucaseus vates Abaris ventura profatur,
Argivum bis sextus Albas rex, martis in armis
Acer, Hypermnestra Lynceoque parentibus ortus;
Hinc et Abantiadum series dat jura Pelagis.
Ex nube Ixion Centaurum gignit Abantem.

*Æneas comitem quo nomine clarus habebat
Aegypti ad fines. Abatos læcet Insula dyces;
Quam arcum armavit iuno natura tenaci,
Armiferæ Thracis quondam urbs Abdera celebris."*

This passage contains the accounts of Abaris, Abantiadae, Abas, Abatos, and Abdera.

In the dedication, which is addressed to James, eldest son of Claud Hamilton, commendator of Paisley, a pupil of the author, Jack complacently mentions that he had been induced to publish by the recommendation of Andrew Melville and Buchanan, and that the latter eminent person had revised the work, and submitted to a counter-revision of works of his own. Prefixed to the *Onomasticon* are encomiastic verses by Robert Pollock, Hercules Pollock, Patrick Sharpe, Andrew Melville, and Sir Thomas Craig. Dr. M'Crie has discovered that Thomas Jack, as minister of Rutherglen, was one of those who in 1582 opposed the election of Robert Montgomery as Archbishop of Glasgow. He appears to have been a member of the General Assembly in 1590; he is mentioned in 1593 as a minister within the bounds of the presbytery of Paisley, and must have died in 1596, as appears from the Testament Testamentar of "Euphame Wylie, relict of umquhill Mr. Thomas Jak, minr. at Eastwod."

JAMES I., King of Scots, and illustrious both in political and literary history, was born at Dunfermline in the year 1394. He was the third son of Robert III., King of Scots (whose father, Robert II., was the first sovereign of the Stuart family), by his consort Annabella or Annaple Drummond, daughter of Sir John Drummond of Stobhall, ancestor of the noble family of Perth. It appears that John Stuart, for such was the real name of Robert III., had married Annaple Drummond at a period antecedent to the year 1358; as in 1357 he and his wife received a charter of the earldom of Athol from David II. The unusual period of thirty-seven years at least must thus have elapsed between the marriage of the parents and the birth of their distinguished son. Their eldest child, David, born in 1373, and created Duke of Rothesay, was starved to death by his uncle the Duke of Albany in 1402; a second son, John, died in infancy. The inheritance of the crown was thus opened upon Prince James at the age of eight years, but under circumstances which rendered the prospect less agreeable than dangerous. The imbecility of Robert III. had permitted the reins of government to be assumed by his brother the Duke of Albany, who meditated a transference of the sovereignty to his own family, and scrupled at no measures which might promise to aid him in his object. There was the greatest reason to apprehend that Prince James, as well as his elder brother the Duke of Rothesay, would be removed by some foul means through the machinations of Albany; after which the existence of the king's female children would present but a trifling obstacle to his assuming the rights of heir presumptive.

The education of Prince James was early confided to Wardlaw, Bishop of St. Andrews, the learned and excellent prelate who, in founding the university in his metropolitan city, became the originator of that valuable class of institutions in Scotland. Sinclair, Earl of Orkney, and Sir David Fleming of Cumbernauld, were among the barons who superintended the instruction of the prince in martial and athletic exercises. For the express purpose of saving him from the fangs of his uncle, it was resolved by the king in 1405 to send him to the court of Charles VI. of France, where he might at once be safer in

person, and receive a superior education to what could be obtained in his own country. With this view the young prince was privately conducted to East Lothian, and embarked on board a vessel at the isle of the Bass, along with the Earl of Orkney and a small party of friends. It would appear that he thus escaped his uncle by a very narrow chance, as Sir David Fleming, in returning from the place of confinement, was set upon at Long Hermanston by the retainers of that wicked personage, and cruelly slain.

James pursued his voyage towards France, till, cruising along the coast of Norfolk, his vessel was seized by a squadron of armed merchantmen commanded by John Jolyff, and belonging to the port of Clay. Though this event took place in the time of a truce between the two countries (April 12, 1405), Henry IV. of England reconciled his conscience to the detention of the prince, for which, indeed, it is highly probable he had made some arrangements previously with the Duke of Albany, his faithful ally, and the imitator of his conduct. When the Earl of Orkney presented a remonstrance against such an unjustifiable act, asserting that the education of the prince was the sole object of his voyage to France, he turned it off with a jest, to the effect that he was as well acquainted with the French language, and could teach it as well as the King of France,¹ so that the prince would lose nothing by remaining where he was. He soon showed, however, the value which he attached to the possession of the prince's person by shutting him up in the castle of Pevensey in Sussex. The aged King of Scotland sank under this new calamity; and, dying April 4, 1406, left the nominal sovereignty to his captive son, but the real power of the state to his flagitious brother, the Duke of Albany, who assumed the title of governor.

Having no design against the mind of his captive, Henry furnished him in a liberal manner with the means of continuing his education. Sir John Pelham, the constable of Pevensey Castle, and one of the most distinguished knights of the age, was appointed his governor; and masters were provided for instructing him in various accomplishments and branches of knowledge. To quote the words of Mr. Tytler,² "In all athletic and manly exercises, in the use of his weapons, in his skill in horsemanship, his speed in running, his strength and dexterity as a wrestler, his firm and fair aim as a joister and tourneyer, the young king is allowed by all contemporary writers to have arrived at a pitch of excellence which left most of his own age far behind him; and as he advanced to maturity, his figure, although not so tall as to be majestic or imposing, was, from its make, peculiarly adapted for excellence in such accomplishments. His chest was broad and full, his arms somewhat long and muscular, his flanks thin and spare, and his limbs beautifully formed; so as to combine elegance and lightness with strength. In throwing the hammer, and propelling, or, to use the Scottish phrase, 'putting' the stone, and in skill in archery, we have the testimony of an ancient chronicle, that none in his own dominions could surpass him. . . . To skill in warlike exercises, every youthful candidate for honour and for knighthood was expected to unite a variety of more pacific and elegant accomplishments, which were intended to render him a delightful companion in the hall, as the others were calculated to make him a formidable enemy in the field.

The science of music, both instrumental and vocal; the composition and recitation of ballads, roundelays, and other minor pieces of poetry; an acquaintance with the romances and the writings of the popular poets of the times—were all essential branches in the system of education which was then adopted in the castle of any feudal chief; and from Pelham, who had himself been brought up as the squire of the Duke of Lancaster, we may be confident that the Scottish king received every advantage which could be conferred by skilful instructors, and by the most ample opportunities of cultivation and improvement. Such lessons and exhibitions, however, might have been thrown away upon many, but James had been born with those natural capacities which fitted him to excel in them. He possessed a fine and correct musical ear; a voice which was rich, flexible, and sufficiently powerful for chamber music; and an enthusiastic delight in the art, which, unless controlled by strong good sense, and a feeling of the higher destinies to which he was called, might have led to a dangerous devotion to it. . . . Cut off for a long and tedious period from his crown and his people, James could afford to spend many hours each day in the cultivation of accomplishments to which, under other circumstances, it would have been criminal to have given up so much of his time. And this will easily account for that high musical excellence to which he undoubtedly attained, and will explain the great variety of instruments upon which he performed. . . . He was acquainted with the Latin language, as far at least as was permitted by the rude and barbarous condition in which it existed previous to the revival of letters. In theology, oratory, and grammar—in the civil and canon laws, he was instructed by the best masters; and an acquaintance with Norman-French was necessarily acquired at a court where it was still currently spoken and highly cultivated. Devoted, however, as he was to these pursuits, James appears to have given his mind with a still stronger bias to the study of English poetry, choosing Chaucer and Gower for his masters in the art, and entering with the utmost ardour into the great object of the first of these illustrious men—the improvement of the English language, the production of easy and natural rhymes, and the refinement of poetical numbers from the rude compositions which had preceded him."

Thus passed years of restraint, unmarked by any other incident than removal from one place of captivity to another, till the death of Henry IV., in 1414. On the very day after this event the "gallant" Henry V. ordered his royal prisoner to be removed to close confinement in the Tower. In general, however, the restraint imposed upon the young king was not inconsistent with his enjoyment of the pleasures of life, among which one of the most agreeable must have been the intercourse which he was allowed to hold with his Scottish friends. It is the opinion of Mr. Tytler, that the policy of the English kings in this matter was much regulated by the terror in which they held a mysterious person residing at the Scottish court, under the designation of King Richard, and who was the object of perpetual conspiracies among the enemies of the house of Lancaster. It is at least highly probable that Albany maintained that personage as a kind of bugbear, to induce the English monarch to keep a close guard over his nephew.

The Duke of Albany died in 1419, and was succeeded as governor by his eldest son Murdoch, who was as weak as his father had been energetic and ambitious. About the same time a large party of Scottish knights and their retainers proceeded, under

¹ It will be remembered that French was the common language of the court of England, and of all legal and public business, till the age following that of Henry IV.

² *Lives of Scottish Worthies*, ii. 263.

the command of the Earl of Buchan, second son of Albany, to assist the French king in repelling the efforts which Henry V. of England was making to gain the sovereignty of France. In the hope perhaps of gaining his deliverance, James was persuaded by King Henry to accompany him to France, and to join with him in taking the opposite side to that which was assumed by this party of his subjects. But of this part of his life no clear account is preserved; only the consideration which he attained with the English king is amply proved by his acting (1422) as chief mourner at his funeral. This, however, was an event which he had little reason to regret, as it opened a prospect of his obtaining his liberty, a circumstance which would scarcely have taken place during the life of Henry; or, at least, while that prince lived, James could not look forward to any definite period for the termination of his captivity.

The Duke of Bedford, who was appointed protector of England on the death of Henry, adopting a wiser policy with regard to Scotland than that monarch had pursued, offered to deliver up the Scottish king on payment of a ransom of £40,000, to be paid within six years by half-yearly payments, and that hostages should be given for the faithful liquidation of the debt. The English, disavowing the term ransom as derogatory, in this instance, to the national character and dignity, alleged that the pecuniary consideration was demanded as payment of the king's maintenance while in England; but as Henry V. allowed only £700 a year for this purpose, and the term of James' captivity was about nineteen years, giving thus an amount of something more than £13,000 altogether, it is pretty evident that they did not intend to be losers by the transaction—though, as the money was never paid, they certainly were not gainers. After a good deal of delay, and much discussion on both sides, the arrangement for the liberation of the king was finally adjusted by the Scottish commissioners who proceeded to London for that purpose, on the 9th of March, 1423; and amongst other securities for the stipulated sum, tendered that of the burghs of Edinburgh, Perth, Dundee, and Aberdeen. Previously to his leaving England, James married Joanna, daughter of the Duchess of Clarence, niece of Richard II. To this lady the Scottish monarch had been long attached. Her beauty had inspired his muse, and was the frequent theme of his song. Amongst the poems attributed to the royal poet, there is one entitled *A Sang on Absence*, beginning "Sen that the eyne that workis my weillfair," in which he bewails, in strains breathing the warmest and most ardent attachment, the absence of his mistress; and in the still more elaborate production of the *King's Quair*, he thus speaks of her:—

"Of hir array, the form gif I will write
Toward her goldin haire and rich atyre,
In fret wise couchit with perlis white;
And grete balas lemyng as the fire,
With many ane emeraunt and saphire;
And on hir hide a chaplet fressh of hewe
Of plumys partit rede, and white, and blue."

In this beautiful poem the enamoured king describes himself as having first fallen in love with his future queen as she was walking in the gardens under the tower at Windsor, in which he was confined.

It is probable that he lost no time in making his fair enslaver aware of the conquest she had made, and it is also likely that her walks under the tower were not rendered less frequent by the discovery. The splendour of Joanna's dress, as described in this poem, is very remarkable. She seems to have been covered with jewels, and to have been altogether

arrayed in the utmost magnificence; not improbably in the consciousness of the eyes that were upon her. The result, at all events, shows that the captive prince must have found means sooner or later of communicating with the fair idol of his affections.

The marriage ceremony was performed at the church of St. Mary's Overy in Southwark; the king receiving with his bride as her marriage portion a discharge for £10,000 of his ransom money!

James was in the thirtieth year of his age when he was restored to his liberty and his kingdom. Proceeding first to Edinburgh, where he celebrated the festival of Easter, he afterwards went on to Scone, accompanied by his queen, where they were both solemnly crowned; Murdoch, Duke of Albany, as Earl of Fife, performing the ceremony of installing the sovereign on the throne.

Immediately after the coronation James convoked a parliament in Perth, and by the proceedings of that assembly gave intimation to the kingdom of the commencement of a vigorous reign. Amongst many other wise and judicious ordinations, this national council enacted, that the king's peace should be firmly held, and no private wars allowed, and that no man should travel with a greater number of retainers than he could maintain; that a sufficient administration of law be appointed throughout the realm; and that no extortion from churchmen or farmers in particular be admitted. James had early been impressed with the necessity of arresting with a vigorous and unsparing hand the progress of that system of fraud and rapine to which the country had been a prey during the regencies that preceded his accession to the throne; a policy which, perhaps, though both necessary and just, there is some reason to believe he carried too far, or at least prosecuted with a mind not tempered by judicious and humane considerations. When first informed, on his arrival in the kingdom, of the lawlessness which prevailed in it, he is said to have exclaimed, "By the help of God, though I should myself lead the life of a dog, I shall make the key keep the castle, and the bush secure the cow." Than such a resolution as this nothing could have been wiser or more praiseworthy, and he certainly did all he could, and probably more than he ought, to accomplish the desirable end which the sentiment proposed; but he seems to have been somewhat indiscriminating in his vengeance. This indiscrimination may be only apparent, and may derive its character from the imperfectness of the history of that period; but as we judge of the good by what is upon record, we are bound to judge of the bad by the same rule; and it would be rather a singular mischance if error and misrepresentation were always and exclusively on the side of the latter. It is at any rate certain, that a remarkable humanity, or any remarkable inclination to the side of mercy, were by no means amongst the number of James' good qualities, numerous though these assuredly were. With the best intentions towards the improvement of his kingdom, and the bettering of the condition of his subjects, James had yet the misfortune to excite, at the commencement of his reign, a very general feeling of dissatisfaction with his government.

This, amongst the aristocracy, proceeded from the severity with which he threatened to visit their offences; and amongst the common people, from his having imposed a tax to pay the ransom money stipulated for his release from captivity. This tax was proposed to be levied at the rate of twelve pennies in the pound on all sorts of produce, on farms and annual rents, cattle and grain, and to continue for two years. The tax was with great diffi-

culty collected the first year, but in the second the popular impatience and dissatisfaction became so general and so marked, that the king thought it advisable to abandon it; and the consequence was, as already remarked, that the debt was never discharged. The reluctance of the nation to pay the price of their prince's freedom may appear ungenerous, and as implying an indifference towards him personally; but this is not a necessary, nor is it the only, conclusion which may be inferred from the circumstance. It is probable that they may have considered the demand of England unreasonable and unjust, and it certainly was both, seeing that James was no prisoner of war, but had been made captive at a time when the two kingdoms were at peace with each other. To make him prisoner, therefore, and make him pay for it too, seems indeed to have been rather a hard case, and such it was probably esteemed by his subjects. The policy which James proposed to adopt was not limited to the suppression of existing evils, or to the prevention of their recurrence in time to come, but extended to the punishing of offences long since committed, and of which, in many instances, though we are told the results, we are left uninformed of the crime. At the outset of his reign he had ordered the arrest of Walter, eldest son of Murdoch, Duke of Albany, the late regent, together with that of Malcolm Fleming of Cumbernauld, and Thomas Boyd of Kilmarnock; and soon afterwards, taking advantage of the circumstance of a meeting of parliament at Perth, which he had convoked probably for the purpose of bringing them within his reach, he ordered the arrest of Murdoch himself, his second son Alexander Stewart, the Earls of Douglas, Angus, and March, and twenty other gentlemen of note.

The vengeance, however, which gave rise to this proceeding, was followed out only in the case of Albany; at least his punishment only is recorded in the accounts given by our historians of this transaction, while all the others are allowed to drop out of sight without any further notice of them in connection with that event. Indeed the whole of this period of Scottish history is exceedingly obscure; much of it is confused, inconsistent, and inexplicable, and is therefore indebted almost wholly to conjecture for any interest it possesses, and perhaps no portion of it is more obscure than that which includes the occurrence which has just been alluded to. The king's vengeance is said to have been exclusively aimed at Albany. Then, wherefore the arrest of the others? Because, it is said, they were the friends of the late regent, and might have defeated the ends of justice had they been left at liberty, or at least might have been troublesome in the event of his condemnation. But how is this to be reconciled with the fact, that several of those arrested with Albany were of the jury that found him guilty on his trial, which took place a few weeks afterwards? All that we certainly know of this matter is, that Murdoch was committed a close prisoner to Carlaweroc Castle, while his duchess, Isabella, shared a similar fate in Tantallon, and that the king immediately after seized upon and took possession of his castles of Falkland in Fife and Downe in Menteith; that soon afterwards, Albany, with his two sons, Walter and Alexander, together with the aged Earl of Lennox, were brought to trial, condemned to death, and beheaded. The principal offence, so far as is known—for on this point also there is much obscurity—charged against those unfortunate persons was their having dilapidated the royal revenues while the king was captive in England. The fate of the two sons of the regent, who were remarkably stout and handsome young

men, excited a good deal of commiseration. The moment their sentence was pronounced, they were led out to execution. Their father and Lennox were beheaded on the following day. The scene of this tragedy was a rising ground immediately adjoining Stirling Castle.

It is not improbable that circumstances unknown to us may have warranted this instance of sanguinary severity on the part of the king; but it is unfortunate for his memory that these circumstances, if they did exist, should be unknown; for as it now stands, he cannot be acquitted of cruelty in this case, as well as some others, otherwise than by alleging that he was incapable of inflicting an unmerited punishment—a defence more generous than satisfactory. The parliaments, however, which James convoked, continued remarkable for the wisdom of their decrees, for the number of salutary laws which they enacted, and for the anxiety generally which they discovered for the prosperity of the kingdom. Amongst the most curious of their laws is one which forbids any man who has accused another from being of the jury on his trial! It is not easy to conceive what were the notions of jurisprudence which permitted the existence of the practice which this statute is meant to put an end to. The allowing the accuser to be one of the jury on the trial of the person he has accused, seems an absurdity and impropriety too palpable and gross to be apologized for, even by the rudeness and barbarity of the times. Another curious statute of this period enacts, that no traveller shall lodge with his friends, but at the common inn. The object of this was to encourage these institutions, only about this time first established in Scotland. They seem, however, very soon to have become popular, as it was shortly afterwards enjoined by act of parliament, that no one should remain in taverns after nine o'clock at night. This of course was meant only to apply to those who resided near the spot, and not to travellers at a distance from their homes.

The subjugation of the Highlands and Isles next occupied the attention of the stern and active monarch. These districts were in the most lawless state, and neither acknowledged the authority of the parliament nor the king. With the view of introducing a better order of things into these savage provinces, and of bringing to condign punishment some of the most turbulent chieftains, James assembled a parliament at Inverness, and specially summoned the heads of the clans to attend it. The summons was obeyed, and about fifty chieftains of various degrees of note and power arrived at Inverness at the appointed time, and were all made prisoners; amongst the rest Alexander, Lord of the Isles. Several of them were instantly beheaded after a summary trial, the others were distributed throughout the different prisons of the kingdom, or kept in ward at the castles of the nobility. The greater part of them were afterwards put to death, and the remainder finally restored to liberty. With a degree of cruelty which the case does not seem to warrant, the Countess of Ross, the mother of the Lord of the Isles, was made a prisoner along with her son, and was long detained in captivity in the island of Inchcolm in the Firth of Forth. Alexander, after a year's confinement, was allowed to return to his own country, on condition that he would in future refrain from all acts of violence; his mother in the meantime being held a hostage for his good conduct. Equally regardless, however, of his promises and the predicament of his parent, he, soon after regaining his liberty, with a large body of followers attacked and burned the town of Inverness. James, to revenge this outrage, instantly collected an army and marched against the perpetrator,

whom he overtook in the neighbourhood of Lochaber. A battle ensued, in which the Lord of the Isles, who is said to have had an army of 10,000 men under him, was totally defeated. Humbled by this misfortune, Alexander soon after made an attempt to procure a reconciliation with the king, but failing in this, he finally resolved to throw himself upon the mercy of the sovereign. With this view he came privately to Edinburgh, and attired only in his shirt and drawers, he placed himself before the high altar of Holyrood Church, and on his knees, in presence of the queen and a number of nobles, presented his naked sword to the king. For this act of humiliation and humble submission his life was spared; but he was ordered into close confinement in the castle of Tantallon.

Some curious and interesting considerations naturally present themselves when contemplating the transactions just spoken of. Amongst these a feeling of wonder is excited to find the summons of the king to the fierce lawless chieftains of the Highlands so readily obeyed. To see them walk so tamely into the trap which was laid for them, when they must have known, from the previous character of the king, that if they once placed themselves within his reach, they might be assured of punishment! Supposing, again, that they were deceived as to his intentions, and had no idea that he meant them any personal violence, but were inveigled within his power by faithless assurances; it then becomes matter of astonishment, that in the very midst of their clans, in the heart of their own country, and in the immediate neighbourhood of their inaccessible retreats, the king should have been able, without meeting with any resistance, to take into custody and carry away as prisoners no fewer than fifty powerful chieftains, and even to put some of them to death upon the spot. This wonder is not lessened by finding that the Lord of the Isles himself could bring into the field 10,000 men, while the greater part of the others could muster from 500 to 5000 each; and it might be thought that, however great was their enmity to each other, they would have made common cause in such a case as this, and have all united in rescuing their chiefs from the hands of him who must have appeared their common enemy. But no such effort was made, and the whole Highlands, as it were, looked quietly on and permitted their chief men to be carried away into captivity. In the midst of these somewhat inexplicable considerations, however, there is one very evident and remarkable circumstance; this is the great power of the king, which could thus enable him to enforce so sweeping an act of justice in so remote and barbarous a part of his kingdom; and perhaps a more striking instance of the existence of that extraordinary power, and of terror inspired by the royal name, is not to be found in the pages of Scottish history.

The parliament of James, directed evidently by the spirit of the monarch, continued from time to time to enact the most salutary laws. In 1427 it was decreed that a fine of ten pounds should be imposed upon burgesses who, being summoned, should refuse to attend parliament, without showing satisfactory cause for their absence; and in the same year several acts were passed for the punishment of murder and felony. The first of these acts, however, was repealed in the following year, by introducing a new feature into the legislature of the kingdom. The attendance of small barons or freeholders in parliament was dispensed with, on condition that each shire sent two commissioners, whose expenses were to be paid by the freeholders. Another singular decree was also passed this year, enjoining the suc-

cessors and heirs of prelates and barons to take an oath of fidelity to the queen. This was an unusual proceeding, but not an unwise one, as it was evidently a provision for the event of the king's death, should it happen during the minority of his heir and successor. It did so happen; and though history is silent on the subject, there is reason to believe that the queen enjoyed the advantage which the act intended to secure to her.

In the year 1428 James wisely strengthened the Scottish alliance with France, by betrothing his eldest daughter, Margaret, but yet in her infancy, to the dauphin, afterwards Louis XI., also at this time a mere child. This contract, however, was not carried into effect until the year 1436, when the dauphin had attained his thirteenth year, and his bride her twelfth. The marriage eventually proved an exceedingly unhappy one. The husband of the Scottish princess was a man of the worst dispositions, and unfortunately there were others about him no less remarkable for their bad qualities. One of these, Jamet De Villy, impressed him, by tales which were afterwards proven to be false, with a suspicion of the dauphiness's fidelity. Though innocent, the unhappy princess was so deeply affected by the infamous accusations which were brought against her, that she took to bed and soon after died of a broken heart, exclaiming before she expired, "Ah! Jamet, Jamet, you have gained your purpose;" such mild but affecting expressions being all that her hard fate and the malice of her enemies could elicit from the dying princess. Jamet was afterwards proven, in a legal investigation which took place into the cause of the death of Margaret, to be a "scoundrel" and "common liar." The death of this princess took place nine years after the marriage, and seven after the death of her father; who, had he been alive, would not, it is probable, have permitted the treatment of his daughter to have passed without some token of his resentment.

The short remaining portion of James' life, either from the defectiveness of the records of that period, or because they really did not occur, presents us with few events of any great importance. Amongst those worthy of any notice are, a commercial league of one hundred years entered into between Scotland and Flanders; the passing of a sumptuary law, forbidding any one but lords and knights, their eldest sons and heirs, from wearing silks and furs; a decree declaring all Scotsmen traitors who travel into England without the king's leave. Another enjoined all barons and lords having lands on the western or northern seas, particularly those opposite to the islands, to furnish a certain number of galleys, according to their tenures; an injunction which was but little attended to. In 1431 James renewed the treaty of peace with England, then just expiring, for five years. In this year also, a desperate encounter took place at Inverlochy between Donald Balloch and the Earls of Mar and Caithness, in which the former was victorious. The Earl of Caithness, with sixteen squires of his family, fell in this sanguinary engagement. Another conflict, still more deadly, took place about the same time in Strathnavern, between Angus Duff, chief of the Mackays of that district, and Angus Moray. There were 1200 men on either side, and it is said that at the termination of the fight there were scarcely nine left alive.

James, in the meantime, proceeded with his system of hostility to the nobles, availing himself of every opportunity which presented itself of humbling them and of lessening their power. He threw into prison his own nephews, the Earl of Douglas and Sir John Kennedy, and procured the forfeiture of the estates

of the Earl of March. The reasons for the first act of severity are now unknown. That for the second was, that the Earl of March's father had been engaged in rebellion against the kingdom during the regency of Albany. The policy of James in arraying himself against his nobles, and maintaining an attitude of hostility towards them during his reign, seems of very questionable propriety, to say nothing of the apparent character of unmerited severity which it assumes in many instances. He no doubt found on his arrival in the kingdom many crimes to punish amongst that class, and much feudal tyranny to suppress; but it is not very evident that his success would have been less, or the object which he aimed at less surely accomplished, had he done this with a more lenient hand. By making the nobles his friends in place of his enemies, he would assuredly have established and maintained the peace of the kingdom still more effectually than he did. They were men, rude as they were, who would have yielded a submission to a personal affection for their prince, which they would, and did, refuse to his authority as a ruler. James erred in aiming at governing by fear, when he should have governed by love. A splendid proof of his error in this particular is presented in the conduct of his great grandson James IV., who pursued a directly opposite course with regard to his nobles, and with results infinitely more favourable to the best interests of the kingdom. Only one event now of any moment occurs until the premature death of James; this is the siege of Roxburgh. To revenge an attempt which had been made by the English to intercept his daughter on her way to France, he raised an army of, it has been computed, 200,000 men, and marching into England, besieged the castle of Roxburgh; but after spending fifteen days before that stronghold, and expending nearly all the missive arms in the kingdom, he was compelled to abandon the siege, and to return with his army without having effected anything at all commensurate with the extent of his preparations, or the prodigious force which accompanied him. The melancholy catastrophe in which his existence terminated was now fast approaching—the result of his own harsh conduct and unforgiving disposition.

The nobles, wearied out with his oppressions, seem latterly to have been restrained only by a want of unanimity amongst themselves from revenging the injuries they had sustained at his hands, or by a want of individual resolution to strike the fatal blow. At length one appeared who possessed the courage necessary for the performance of this desperate deed. This person was Sir Robert Graham, uncle to the Earl of Strathern. He also had been imprisoned by James, and was therefore his enemy on personal as well as general grounds.

At this crisis of the dissatisfaction of the nobles Graham offered, in a meeting of the latter, to state their grievances to the king, and to demand the redress of these grievances, provided those who then heard him would second him in so doing. The lords accepted his offer, and pledged themselves to support him. Accordingly, in the very next parliament, Graham rose up, and having advanced to where the king was seated, laid his hand upon his shoulder and said, "I arrest you in the name of all the three estates of your realm here assembled in parliament, for as your people have sworn to obey you, so are you constrained by an equal oath to govern by law, and not to wrong your subjects, but in justice to maintain and defend them." Then turning round to the assembled lords, "Is it not thus as I say?" he exclaimed—but the appeal remained unanswered. Either awed by the royal presence, or thinking that

Graham had gone too far, the lords meekly declined to afford him the support which they had promised him. That Graham had done a rash thing, and had said more than his colleagues meant he should have said, is scarcely an apology for their deserting him as they did in the hour of trial. They ought at least to have afforded him some countenance, and to have acknowledged so much of his reproof as they were willing should have been administered; and there is little doubt that a very large portion of its spirit was theirs also, although they seem to have lacked the courage to avow it. Graham was instantly ordered into confinement, and was soon after deprived of all his possessions and estates, and banished the kingdom. Brooding over his misfortunes, and breathing vengeance against him who was the cause of them, the daring exile retired to the remotest parts of the Highlands, and there arranged and perfected his plans of revenge. He first wrote letters to the king renouncing his allegiance and defying his wrath, upbraiding him with being the ruin of himself, his wife, and his children, and concluded with declaring that he would put him to death with his own hand if opportunity should offer. The answer to these threats and defiance was a proclamation which the king immediately issued, promising 3000 demies of gold, of the value of half an English noble each, to any one who should bring in Graham dead or alive.

The king's proclamation, however, was attended with no effect. The object of it not only remained in safety in his retreat, but proceeded to mature the schemes of vengeance which he meditated against his sovereign. He opened a correspondence with several of the nobility, in which he unfolded the treason which he designed, and offered to assassinate the king with his own hand.

The general dislike which was entertained for James, and which was by no means confined to the aristocracy, for his exactions had rendered his government obnoxious also to the common people, soon procured for Graham a powerful co-operation; and the result was, that a regular and deep-laid conspiracy, and which included even some of the king's most familiar domestics, was speedily formed. In the meantime the king, unconscious of the fate which was about to overtake him, had removed with his court to Perth to celebrate the festival of Christmas. While on his way thither, according to popular tradition, he was accosted by a soothsayer, who forewarned him of the disaster which was to happen him. "My lord king," she said, for it was a prophetess who spoke, "if ye pass this water" (the Forth), "ye shall never return again alive." The king is said to have been much struck by the oracular intimation, and not the less so that he had read in some prophecy a short while before, that in that year a king of Scotland should be slain. The monarch, however, did not himself deign on this occasion to interrogate the soothsayer as to what she meant, but deputed the task to one of the knights, whom he desired to turn aside and hold some conversation with her. This gentleman soon after rejoined the king, and representing the prophetess as a foolish inebriated woman, recommended to his majesty to pay no attention to what she had said. Accordingly no further notice seems to have been taken of the circumstance. The royal party crossed the water and arrived in safety at Perth; the king, with his family and domestics, taking up his residence at the Dominicans' or Blackfriars' monastery. The conspirators, in the meantime, fully informed of his motions, had so far completed their arrangements as to have fixed the night on which he should be assassinated. This was, according to some authori-

ties, the night of the second Wednesday of Lent, or the 27th day of February; by others, the first Wednesday of Lent, or between the 20th or 21st of that month, in the year 1437; and the latter is deemed the more accurate date. James spent the earlier part of the evening in playing chess with one of his knights, whom, for his remarkable devotion to the fair sex, he humorously nicknamed the King of Love. The king was in high spirits during the progress of the game, and indulged in a number of jokes at the expense of his brother king; but the dark hints which he had had of his fate seemed, as it were, in spite of himself, to have made an impression upon him, and were always present to him even in his merriest moods, and it was evidently under this feeling that he said—more in earnest than in joke, though he endeavoured to give it the latter character—to his antagonist in the game, “Sir King of Love, it is not long since I read a prophecy which foretold that in this year a king should be slain in this land, and ye know well, sir, that there are no kings in this realm but you and I. I therefore advise you to look carefully to your own safety, for I give you warning that I shall see that mine is sufficiently provided for.” Shortly after this a number of lords and knights thronged into the king’s chamber, and the mirth, pastime, and joke went on with increased vigour. In the midst of the revelry, however, the king received another warning of his approaching fate. “My lord,” said one of his favourite squires, tempted probably by the light tone of the conversation which was going forward, “I have dreamed that Sir Robert Graham should have slain you.” The Earl of Orkney, who was present, rebuked the squire for the impropriety of his speech, but the king, differently affected, said that he himself had dreamed a terrible dream on the very night of which his attendant spoke.

In the meantime the night wore on, and all still remained quiet in and around the monastery; but at this very moment Graham, with 300 fierce Highlanders, was lurking in the neighbourhood, waiting the midnight hour to break in upon the ill-fated monarch. The mirth and pastime in the king’s chamber continued until supper was served, probably about nine o’clock at night. As the hour of this repast approached, however, all retired excepting the Earl of Athol and Robert Stuart, the king’s nephew, and one of his greatest favourites—considerations which could not bind him to the unfortunate monarch, for he too was one of the conspirators, and did more than any one of them to facilitate the murderous intentions of his colleagues, by destroying the fastenings of the king’s chamber-door. After supper the amusements of the previous part of the evening were resumed, and chess, music, singing, and the reading of romances, wiled away the next two or three hours. On this fatal evening another circumstance occurred which might have aroused the suspicions of the king, if he had not been most unaccountably insensible to the frequent hints and indirect intimations which he had received of some imminent peril hanging over him. The same woman who had accosted him before crossing the firth again appeared, and knocking at his chamber door at a late hour of the night, sought to be admitted to the presence of the king. “Tell him,” she said to the usher who came forth from the apartment when she knocked, “that I am the same woman who not long ago desired to speak with him when he was about to cross the sea, and that I have something to say to him.” The usher immediately conveyed the message to the king, but he being wholly engrossed by the game in which he was at the instant engaged, merely ordered her to return on the morrow. “Well,” replied the dis-

appointed soothsayer, as she at the first interview affected to be, “ye shall all of you repent that I was not permitted just now to speak to the king.” The usher laughing at what he conceived to be the expressions of a fool, ordered the woman to be gone, and she obeyed. The night was now wearing late, and the king, having put an end to the evening’s amusements, called for the parting cup. This drunk, the party broke up, and James retired to his bed-chamber, where he found the queen and her ladies amusing themselves with cheerful conversation. The king, now in his night-gown and slippers, placed himself before the fire, and joined in the badinage which was going forward. At this moment the king was suddenly startled by a great noise at the outside of his chamber-door, or rather in the passage which led to it. The sounds were those of a crowd of armed men pressing hurriedly forward. There was a loud clattering and jingling of arms and armour, accompanied by the gleaming of torches. The king seems to have instantly apprehended danger, a feeling which either he had communicated to the ladies in the apartment, or they had of themselves conceived, for they immediately rushed to the door with the view of securing it, but they found all the fastenings destroyed, and a bar which should have been there removed.

This being intimated to the king, he called out to the ladies to hold fast the door as well as they could, until he could find something wherewith to defend himself; and he flew to the window of the apartment and endeavoured to wrench away one of the iron stanchions for this purpose, but the bar resisted all his efforts. In this moment of horror and despair, the unhappy monarch next seized the tongs, which lay by the fireside, and by their means, and with some desperate efforts of personal strength, he tore up a portion of the floor, and instantly descending through the aperture into a mean receptacle which was underneath the chamber, drew the boards down after him to their original position. In the meantime the ladies had contrived to keep out the conspirators, and in this effort, it is said, Catharine Douglas had one of her arms broken, by having thrust it into the wall in place of the bar which had been removed. The assassins, however, at length forced their way into the apartment; and here a piteous scene now ensued. The queen stood in the middle of the floor, bereft of speech and motion by her terror, while her ladies filled the apartment with the most lamentable cries and shrieks.

One of the ruffians on entering inflicted a severe wound on the queen, and would have killed her outright but for the interference of one of the sons of Sir Robert Graham, who, perceiving the dastard about to repeat the blow, exclaimed, “What would ye do to the queen? for shame of yourself, she is but a woman; let us go and seek the king.” The conspirators, who were all armed with swords, daggers, axes, and other weapons, now proceeded to search for the king. They examined all the beds, presses, and other probable places of concealment, overturned forms and chairs, but to no purpose; the king could not be found, nor could they conceive how he had escaped them. The conspirators, balked in their pursuit, dispersed themselves throughout the different apartments to extend their search. This creating a silence in the apartment immediately above the king, the unfortunate monarch conceived the conspirators had entirely withdrawn, and in his impatience to get out of his disagreeable situation, called out to the ladies to bring him sheets for that purpose. In the attempt which immediately followed to raise him up by these means, Elizabeth Douglas, another of the

queen's waiting-maids, fell into the hole in which the king was concealed. At this moment Thomas Chambers, one of the assassins, and who was also one of the king's domestics, entered the apartment, and perceiving the opening in the floor he immediately proceeded towards it, and looking down into the cellar, with the assistance of his torch discovered the king. On describing the object of his search Chambers exultingly called out to his companions, "Sirs, the bride is found for whom we sought, and for whom we have caroled here all night." The joyful tidings instantly brought a crowd of the conspirators to the spot, and amongst the rest Sir John Hall, who, with a large knife in his hand, hastily descended to the king's hiding-place. The latter, however, who was a man of great personal strength, instantly seized the assassin and threw him down at his feet; and his brother, who followed, shared the same treatment—the king holding them both by their throats, and with such a powerful grasp, that they bore marks of the violence for a month afterwards. The unfortunate monarch now endeavoured to wrest their knives from the assassins, and in the attempt had his hands severely cut and mangled.

Sir Robert Graham, who had hitherto been merely looking on, now seeing that the Halls could not accomplish the murder of the king, also descended, and with a drawn sword in his hand. Unable to cope with them all, and exhausted with the fearful struggle which he had maintained with the two assassins, weaponless and disabled in his hands, the king implored Graham for mercy. "Cruel tyrant," replied the regicide, "thou hast never mercy on thy kindred nor on others who fell within thy power, and therefore thou shalt have no mercy from me." "Then I beseech thee, for the salvation of my soul, that thou wilt permit me to have a confessor," said the miserable prince. "Thou shalt have no confessor but this sword," replied Graham, thrusting his victim through the body with his weapon. The king fell, but the stroke was not instantly fatal. He continued in the most piteous tones to supplicate mercy from his murderer, offering him half his kingdom if he would but spare his life. The heart-rending appeals of the hapless monarch shook even Graham's resolution, and he was about to desist from doing him further injury, when, his intentions being perceived by the conspirators from above, they called out to him that if he did not complete the deed, he should himself suffer death at their hands. Urged on by this threat, the three assassins again attacked the king, and finally despatched him, having inflicted sixteen deadly wounds on his chest, besides others on different parts of his body. As if every circumstance which could facilitate his death had conspired to secure that event, it happened that the king, some days before he was murdered, had directed that an aperture in the place where he had concealed himself, and by which he might have escaped, should be built up, as the balls with which he played at tennis in the courtyard were apt to be lost in it. After completing the murder of the king, the assassins sought for the queen, whom, dreading her vengeance, they proposed to put also to death; but she had escaped. A rumour of the tragical scene that was enacting at the monastery having spread through the town, great numbers of the citizens, and of the king's servants, with arms and torches hastened to the spot, but too late, to the assistance of the murdered monarch. The conspirators, however, all escaped for the time, excepting one, who was killed by Sir David Dunbar, who had himself three fingers cut off in the contest. This brave knight had alone attacked the fleeing conspirators, but was overpowered and left disabled.

In less than a month, such was the activity of the queen's vengeance, all the principal actors in this appalling tragedy were in custody, and were afterwards put to the most horrible deaths. Stuart and Chambers, who were the first taken, were drawn, hanged, and quartered, having been previously lacerated all over with sharp instruments. Graham was carried through the streets of Edinburgh in a cart, in a state of perfect nudity, with his right hand nailed to an upright post, and surrounded with men, who, with sharp hooks and knives and red-hot irons, kept constantly tearing at and scorching his miserable body, until he was completely covered with wounds. Having undergone this, he was again thrown into prison, and on the following day brought out to execution. The wretched man had, when released from his tortures, wrapped himself in a coarse woollen Scottish plaid, which adhering to his wounds, caused him much pain in the removal. When this operation was performed, and it was done with no gentle hand, the miserable sufferer fainted and fell to the ground with the agony. On recovering, which he did not do for nearly a quarter of an hour, he said to those around him, that the rude manner in which the mantle had been removed had given him greater pain than any he had yet suffered. To increase the horrors of his situation, his son was disembowelled alive before his face.

James I. perished in the forty-fourth year of his age, after an actual reign of thirteen years. His progeny were, a son (his successor), and five daughters. These were, Margaret, married to the dauphin; Isabella, to Francis, Duke of Bretagne; Eleanor, to Sigismund, Archduke of Austria; Mary, to the Count de Boucquan; and Jean, to the Earl of Angus, afterwards Earl of Morton.

JAMES IV., King of Scots, was the eldest son of James III., by Margaret, daughter of Christiern, King of Denmark; and was born in the month of March, 1472. Of the manner of his education no record has been preserved; but it was probably good, as his father, whatever might be his faults, appears to have been a monarch of considerable taste and refinement. In the year 1488 a large party of nobles rebelled against James III. on account of various arbitrary proceedings with which they were displeased; and the king, on going to the north to raise an army for their suppression, left his son, the subject of the present memoir, in the keeping of Shaw of Sauchie, governor of Stirling Castle. While the king was absent, the confederate nobles prevailed on Shaw to surrender his charge; and the prince was then set up as their nominal, but, it would appear, involuntary leader. The parties met, July 11, at Sauchie, near Stirling; and the king fell a victim to the resentment of his subjects. The subject of the present memoir then mounted the throne, in the sixteenth year of his age.

Neither the precise objects of this rebellion, nor the real nature of the prince's concern in its progress and event, are distinctly known. It is certain, however, that James IV. always considered himself as liable to the vengeance of Heaven for his share, voluntary or involuntary, in his father's death; and accordingly wore a penitential chain round his body, to which he added new weight every year; and even contemplated a still more conspicuous expiation of his supposed offence, by undertaking a new crusade. Whatever might be the guilt of the prince, the nation had certainly no cause to regret the death of James III., except the manner in which it was accomplished; while they had everything to hope from the generous young monarch who was his successor.

James possessed in an eminent degree every quality necessary to render a sovereign beloved by his subjects; and perhaps no prince ever enjoyed so large a portion of personal regard, of intense affection, as did James IV. of Scotland. His manner was gentle and affable to all who came in contact with him, whatever might be their rank or degree. He was just and impartial in his decrees, yet never inflicted punishment without strong and visible reluctance. He listened willingly and readily to admonition, and never discovered either impatience or resentment while his errors were placed before him. He took everything in good part, and endeavoured to amend the errors in his conduct pointed out by his advisers. He was generous even to a fault; magnificent and princely in all his habits, pursuits, and amusements. His mind was acute, and dignified and noble. He excelled in all warlike exercises and manly accomplishments; in music, horsemanship, and the use of sword and spear. Nor was his personal appearance at variance with this elevated character. His form, which was of the middle size, was exceedingly handsome, yet stout and muscular, and his countenance had an expression of mildness and dignity that instantly predisposed all who looked upon it to a strong attachment to its possessor.

His bravery, like his generosity, was also in the extreme: it was romantic. Altogether he was unquestionably the most chivalrous prince of his day in Europe. A contemporary poet bears testimony to this part of his character:—

"And ye Christian princes, whosoever ye be,
If ye be destitute of a noble capytayne,
Take James of Scotland for his audacie
And proved manhood, if ye will laude atchieve;
Let him have the forward, have ye no disdayne,
Nor indignation; for never king was borne
That of ought of warr can shewe the unicornie."

"For if that he take once his speare in hand,
Against these Turkes strongly with it to ride,
None shall be able his stroke for to withstand
Nor before his face so hardy to abide;
Yet this his manhood increaseth not his pride,
But ever sheweth he mekenes and humilie,
In word or dede, to hye and lowe degree."

A neglected education left him almost totally ignorant of letters, but not without a high relish for their beauties. He delighted in poetry, and possessed a mind attuned to all its finer sympathies.

The design of the rebel lords in taking arms against their sovereign, James III., being merely to free themselves from his weak and tyrannical government, without prejudice to his heirs, his son James IV. was immediately after the death of his father proclaimed king, and was formally invested with that dignity at Scone. However violent and unlawful were the proceedings which thus prematurely elevated James to the throne, the nation soon felt a benefit from the change which could scarcely have been looked for from an administration originating in rebellion and regicide. The several parliaments which met after the accession of the young king passed a number of wise and salutary laws, encouraging trade, putting down turbulence and faction, and enjoining the strict execution of justice throughout the kingdom.

The prince and his nobles placed the most implicit confidence in each other, and the people in both. This good understanding with the former the king encouraged and promoted, by inviting them to frequent tournaments and other amusements and warlike exercises, in accordance with his own chivalrous spirit, and adapted to their rude tastes and habits. These tournaments were exceedingly splendid, and were invested with all the romance of the brightest days of chivalry. Ladies, lords, and knights, in the

most gorgeous attire, crowded round the lists, or from draped balconies witnessed the combats that took place within them. James himself always presided on these occasions, and often exhibited his own prowess in the lists; and there were few who could successfully compete with him with spear, sword, or battle-axe. Stranger knights from distant countries, attracted by the chivalric fame of the Scottish court, frequently attended and took part in these tournaments, but, it is said, did not in many instances prove themselves better men at their weapons than the Scottish knights. One of the rules of these encounters was, that the victor should be put in possession of his opponent's weapon; but when this was a spear, a purse of gold, a gift from the king, was attached to the point of it. These trophies were delivered to the conqueror by the monarch himself. The people were delighted with these magnificent and warlike exhibitions, and with their generous and chivalrous author. Nor were the actors themselves, the nobles, less gratified with them, or less affected by the high and princely spirit whence they emanated. They brought them into frequent and familiar contact with their sovereign, and nothing more was necessary in the case of James to attach them warmly and devotedly to his person. His kind and affable manner accomplished the rest.

By such means he was not only without a single enemy amongst the aristocracy, but all of them would have shed the last drop of their blood in his defence, and a day came when nearly all of them did so. In short, the wisest policy could not have done more in uniting the affections of prince and peers, than was accomplished by those warlike pastimes, aided as they were by the amiable manners of the monarch.

Not satisfied with discharging his duty to his subjects from his high place on the throne, James frequently descended, and disguising his person—a practice to which his successor was also much addicted—roamed through the country unarmed and unattended, inquiring into his own reputation amongst the common people, and endeavouring to learn what faults himself or his government were charged with. On these occasions he lodged in the meanest hovels, and encouraged the inmates to speak their minds freely regarding their king; and there is little doubt, that, as his conduct certainly merited it, so he must have been frequently gratified by their replies. The young monarch, however, was charged with stepping aside occasionally in his rambles from this laudable though somewhat romantic pursuit, and paying visits to any of his fair acquaintances whose residence happened to be in his way; and it is alleged that he contrived they should very often be so situated.

Unfortunately for his courtiers, James conceived that he possessed, and not improbably actually did possess, considerable skill in surgery and medicine; but there is reason to believe that the royal surgeon's interference in cases of ailment was oftener dreaded than desired, although Lindsay says that "their was none of that profession (the medical) if they had any dangerous cure in hand, but would have craved his adwyse." Compliments, however, to a king's excellence in any art or science are always suspicious, and this of Lindsay's is not associated with any circumstances which should give it a claim to exemption from such a feeling.

One of the greatest faults of the young monarch was a rashness and impetuosity of temper. This frequently led him into ill-timed and ill-judged hostilities with the neighbouring kingdom, and, conjoined with a better quality, his generosity, induced

him to second the pretensions of the impostor Perkin Warbeck to the crown of England. That adventurer arrived at James' court in 1496, attended by a numerous train of followers—all attired in magnificent habits, and sought the assistance of the Scottish king to enable him to recover what he represented as his birthright. Prepossessed by the elegant manner and noble bearing of the impostor, and readily believing the story of his misfortunes, which was supported by plausible evidence, the generous monarch at once received him to his arms, and not only entertained him for some time at his court, but, much against the will of his nobles, mustered an army, and, with Warbeck in his company, marched at the head of it into England, to reinstate his protégé in what he believed to be his right at the point of the sword—a project much more indicative of a warm and generous heart than of a prudent head. The enterprise, as might have been expected, was unsuccessful. James had counted on a rising in England in behalf of the pretender; but, being disappointed in this, he was compelled to abandon the attempt and to return to Holyrood. The King of England did not retaliate on James this invasion of his kingdom; but he demanded from him the person of the impostor. With this request, however, the Scottish king was much too magnanimous to comply; and he not only refused to accede to it, but furnished Warbeck with vessels and necessaries to carry him to Ireland, whither he now proceeded. James is fully relieved from the charge of credulity which might appear to lie against him for so readily confiding in Warbeck's representations by the extreme plausibility which was attached to them, and by the strongly corroborative circumstances by which they were attended. He is also as entirely relieved from the imputation of conniving in the imposture—an accusation which has been insinuated against him—by the circumstance of his having given a near relation of his own, Catharine Gordon, a daughter of Lord Huntly's, in marriage to the impostor, which it cannot for a moment be believed he would have done had he known the real character of Warbeck.

The species of roving life which the young monarch led was now about to be circumscribed, if not wholly terminated, by his entering into the married state. This he avoided as long as he possibly could, and contrived to escape from it till he had attained the thirtieth year of his age. Henry of England, however, who had always been more desirous of James' friendship than his hostility, and had long entertained views of securing the former by a matrimonial connection with his family, at length succeeded in procuring James' consent to marry his daughter Margaret, an event which took place in 1503.

Whatever reluctance the monarch might have had to resign his liberty, he was not wanting in gallantry to his fair partner when she came to claim it. He first waited upon her at Newbattle, where he entertained her with his own performance on the clari-chords and lute, listened to specimens of her own skill in the same art on bended knee, and altogether conducted himself like a true and faithful knight. He also exhibited a care and elegance in his dress on this occasion sufficiently indicative of his desire to please. He was arrayed in a black velvet jacket, bordered with crimson velvet, and furred with white; and when he afterwards conducted his bride from Dalkeith to Edinburgh, which he did, strange to tell, seated on horseback behind him, he appeared in a jacket of cloth of gold, bordered with purple velvet furred with black, a doublet of violet satin, scarlet hose, the collar of his shirt studded with precious

stones and pearls, with long gilt spurs projecting from the heels of his boots.

By the terms of the marriage contract the young queen, who was only in her fourteenth year when she was wedded to James, was to be conducted to Scotland at the expense of her father, and to be delivered to her husband or to persons appointed by him at Lamberton Kirk. The latter was to receive with her a dowry of thirty thousand pieces of gold; ten thousand to be paid at Edinburgh eight days after the marriage, other ten thousand at Coldingham a year afterwards, and the last ten thousand at the expiry of the year following. The marriage was celebrated with the utmost splendour and pomp. Feastings, tourneyings, and exhibitions of shows and plays, succeeded each other in one continued and uninterrupted round for many days, James himself appearing in the lists at the tournaments in the character of the "Savage Knight." But there is no part of the details of the various entertainments got up on this occasion that intimates so forcibly the barbarity of the times, as the information that real encounters between a party of Highlanders and Borderers, in which the combatants killed and mangled each other with their weapons, were exhibited for the amusement of the spectators.

A more grateful and more lasting memorial of the happy event of James' marriage than any of these is to be found in Dunbar's beautiful allegorical poem, the *Thistle and the Rose*, composed on that occasion, and thus aptly and emblematically entitled from the union being one between a Scottish king and English princess. In this poem Dunbar, who then resided at the court, hints at the monarch's character of being a somewhat too general admirer of the fair sex, by recommending him to reserve all his affections for his queen.

"Nor hauld no other flower in sic deny
As the fresche rose, of collor reid and white;
For gif thou dois, hurt is thine honesty,
Considering that no flower is so perfyte."

It is said to have been at the rude but magnificent court of this monarch that the character of a Scottish courtier first appeared; this class so numerous at all the other courts of Europe having been hitherto unknown in Scotland. These raw courtiers, however, made rapid progress in all the acquirements necessary to their profession, and began to cultivate all their winning ways, and to pay all that attention to their exterior appearance, on which so much of the hopes of the courtier rests. A finely and largely-ruffled shirt, the especial boast and delight of the ancient Scottish courtier, a flat little bonnet, russet hose, perfumed gloves, embroidered slippers that glittered in the sun or with candle-light, a handkerchief also perfumed and adorned with a golden tassel at each corner, and garters knotted into a huge rose at the knee—were among the most remarkable parts of the dress of the hangers-on at the court of James IV. In one important particular, however, these gentlemen seemed to have wonderfully resembled the courtier of the present day. *Na Kindness at Court without Siller* is the title of a poem by Sir Richard Maitland of Lethington, who had every opportunity of knowing personally what was the character of that of his native sovereign.

One of the stipulations of the marriage treaty between the king and the daughter of Henry VII. having secured an inviolable peace between the two monarchs and their subjects, the nation enjoyed for several years after that event the most profound tranquillity. This leisure James employed in improving the civil polity of his kingdom; in making efforts to introduce civilization, and an obedience to

the laws into the Highlands and Isles, by establishing courts of justice at Inverness, Dingwall, and various other places throughout these remote districts; in enlarging and improving his navy, and, in short, in doing everything that a wise prince could do to promote the prosperity of his kingdom. In all these judicious proceedings James was cordially supported by his parliament, a department of the legislature in which he was perhaps more fortunate than any of his predecessors had ever been, and certainly more than were any of his immediate successors. The acts of the parliament of James IV. are distinguished by the most consummate wisdom, and by a constant aiming at the improvement and prosperity of the kingdom, whether by suppressing violence, establishing rules for the dispensation of justice, or in encouraging commerce; and they are no less remarkable for a spirit of cordiality towards the sovereign, amounting to a direct and personal affection, which breathes throughout the whole. How much of this good feeling, and of this happy co-operation in good works, depended upon the king, and how much upon the parliaments themselves, it would not be easy to determine; but it is certain that much of the merit which attaches to it must be awarded to the sovereign.

This peaceful and prosperous state of the kingdom, however, after enduring for upwards of nine years, at length drew to a close, and finally terminated in one of the most disastrous events recorded in the pages of her history. Henry VII. died, and was succeeded by Henry VIII. Besides the change which this occurrence effected in the relationship between the sovereigns of England and Scotland, the feelings and policy of the new monarch towards the latter kingdom were totally dissimilar to those of his predecessor. He seems, indeed, to have brought with him to the throne a feeling of hostility towards Scotland; and this feeling, the sensitive, warm-tempered, and impetuous monarch against whom it was entertained was not long in discovering. The consequence was, that, after some slight mutual offences, which, under any other circumstances, might have been easily atoned for, war was proclaimed between the two kingdoms, and both made the most formidable preparations for deciding their differences on the field of battle. James summoned the whole array of his kingdom, including all the Western Isles and the most remote parts of the Highlands, to assemble on the Borough Muir within twenty days, each, as was usual on such occasions, to come provided with forty days' provisions. Though the impending war was deprecated by James' council, and was by all considered imprudent, yet such was his popularity, such the general affection for the high-spirited and generous monarch, that no less than 100,000 men appeared in arms at the place of muster; disapproving, indeed, of the object for which they were brought together, but determined to shed the last drop of their blood in their sovereign's quarrel—because it was his, and because he had determined on bringing it to the issue of the sword. Deeply imbued with the superstition of the period, James spent much of his time immediately before setting out with his army in the performance of religious rites and observances. On one of these occasions, and within a few days of his marching on his expedition, a circumstance occurred which the credulity of the times has represented as supernatural, but in which it is not difficult to detect a design to work on the superstitious fears of the king to deter him from proceeding on his intended enterprise. While at his devotions in the church of Linlithgow, a figure, clothed in a blue gown secured by a linen girdle, and

wearing sandals, suddenly appeared in the church, and calling loudly for the king, passed through the crowd of nobles by whom he was surrounded, and finally approached the desk at which his majesty was seated at his devotions. Without making any sign of reverence or respect for the royal presence, the mysterious visitor now stood full before the king, and delivered a commission as if from the other world. He told him that his expedition would terminate disastrously, advised him not to proceed with it, and cautioned him against the indulgence of illicit amours. The king was about to reply, but the spectre had disappeared, and no one could tell how. The figure is represented as having been that of an elderly grave-looking man, with a bald uncovered head, and straggling gray locks resting on his shoulders. There is little doubt that it was a stratagem of the queen's, and that the lords who surrounded the king's person were in the plot. Some other attempts of a similar kind were made to alarm the monarch, and to deter him from his purpose, but in vain. Neither superstition nor the ties of natural affection could dissuade him from taking the field. Resisting all persuasion, and even the tears and entreaties of his queen, who, amongst the other arguments which her grief for the probable fate of her husband suggested, urged that of the helpless state of their infant son; the gallant but infatuated monarch took his place at the head of his army, put the vast array in marching order, and proceeded on that expedition from which he was never to return. The Scottish army having passed the Tweed began hostilities by taking some petty forts and castles, and amongst the latter that of Ford; here the monarch found a Mrs. Heron, a lady of remarkable beauty, and whose husband was at that time a prisoner in Scotland. Captivated by this lady's attractions—while his natural son, the Archbishop of St. Andrews, who accompanied him, acknowledged those of her daughter—James spent in her society that time which he should have employed in active service with his army. The consequence of this inconceivable folly was, that his soldiers, left unemployed, and disheartened by a tedious delay, gradually withdrew from his camp and returned to their homes, until his army was at length reduced to little more than 30,000 men. A sense of honour, however, still detained in his ranks all the noblemen and gentlemen who had first joined them, and thus a disproportionate number of the aristocracy remained to fall in the fatal field which was soon afterwards fought. In the meantime the Earl of Surrey, lieutenant-general of the northern counties of England, advanced towards the position occupied by James' forces, with an army of 31,000 men.

On the 7th of September, 1513, the latter encamped at Woolerhaugh, within five miles of Flodden Hill, the ground on which the Scottish army was encamped. On the day following they advanced to Banmore Wood, distant about two miles from the Scottish position, and on the 9th presented themselves in battle array at the foot of Flodden Hill. The Scottish nobles endeavoured to prevail upon the king not to expose his person in the impending encounter, but he rejected the proposal with disdain, saying, that to outlive so many of his brave countrymen would be more terrible to him than death itself. Finding they could not dissuade him from his purpose of sharing in the dangers of the approaching fight, they had recourse to an expedient to lessen the chances of a fatal result. Selecting several persons who bore a resemblance to him in figure and stature, they clothed them in a dress exactly similar to that worn by the monarch, and dispersed them through-

out the ranks of the army. The English army, when it presented itself to the Scots, was drawn up in three large divisions; Surrey commanding that in the centre, Sir Edward Stanley and Sir Edmund Howard those on the right and left, while a large body of cavalry, commanded by Dacre, was posted in the rear. The array of the Scots was made to correspond to this disposition, the king himself leading on in person the division opposed to that commanded by Surrey, while the Earls of Lennox, Argyle, Crawford, Montrose, Huntly, and Home jointly commanded those on his right and left. A body of cavalry, corresponding to that of Dacre's, under Bothwell, was posted immediately behind the king's division. Having completed their dispositions, the Scots, with their long spears levelled for the coming strife, descended from the hill, and were soon closed with the enemy. The divisions commanded by Huntly and Home, on the side of the Scots, and by Howard on the side of the English, first met, but in a few minutes more all the opposing divisions came in contact with each other, and the battle became general.

The gallant but imprudent monarch himself, surrounded by a band of his no less gallant nobles, was seen fighting desperately in the front of his men, and in the very midst of a host of English billmen. After various turns of fortune, the day finally terminated in favour of the English, though not so decisively as to assure them of their success, for it was not till the following day that Surrey, by finding the field abandoned by the Scots, ascertained that he had gained the battle. In this sanguinary conflict, which lasted for three hours, having commenced at four o'clock in the afternoon and continued till seven, there perished twelve earls, thirteen lords, five eldest sons of peers, about fifty gentlemen of rank and family, several dignitaries of the church, and about 10,000 common men. Amongst the churchmen who fell were the king's natural son, the Archbishop of St. Andrews, Hepburn, Bishop of the Isles, and the Abbots of Kilwinning and Inchaffray. James himself fell amidst a heap of his slaughtered nobles, mortally wounded in the head by an English bill, and pierced in the body with an arrow. It was long believed by the common people that the unfortunate monarch had escaped from the field, and that he had gone on a pilgrimage to Palestine, where tradition represented him to have ended his days in prayer and penitence for his sins, and especially for that of his having borne arms against his father. This belief was strengthened by a rumour that he had been seen between Kelso and Dunse after the battle was fought. That he actually fell at Flodden, however, has been long since put beyond all doubt, and the fate of his body is singular. It appears to have been carried to London, and to have been embalmed there, but by whom or by whose orders is unknown. In the reign of Elizabeth, some sixty or seventy years afterwards, the shell in which the body was deposited, and still containing it, was found in a garret amongst a quantity of lumber by a slater while repairing the roof of a house. The body was still perfectly entire, and emitted a pleasant fragrance from the strong aromas which had been employed in its preservation. Looking on it as a great curiosity, though unaware whose remains it was, the slater chopped off the head, carried it home with him, and kept it for several years. Such was the fate of the mortal part of the noble-minded, the high-souled monarch, James IV. of Scotland. He was in the forty-first year of his age, and the twenty-sixth of his reign, when he fell on Flodden field.

At this distance of time everything relating to that

celebrated but calamitous contest—the most calamitous recorded in the pages of Scottish history—possesses a deep and peculiar interest; but of all the memorials which have reached us of that fatal event, there is not one perhaps so striking and impressive as the proclamation of the authorities of Edinburgh. The provost and magistrates were in the ranks of the king's army, and had left the management of the town's affairs in the hands of deputies. On the day after the battle was fought, a rumour had reached the city that the Scottish army had met with a disaster, and the following proclamation—the one alluded to—was in consequence issued. The hopes, fears, and doubts which it expresses, now that all such feelings regarding the event to which it refers have long since passed away, cannot be contemplated without a feeling of deep and melancholy interest. "The 10th day of September the year above written (1513), we do zow to witt. Forasmeikle as thair is ane grait rumour now laillie rysin within this toun, touching our soverane lord and his army, of the quhilk we understand thair is cum in na veritie as yet. Quhairfore we charge straitly, and commandis in our said soverane lord the kingis name, and the presidentis for the provost and baillies within this burgh, that all manner of personis, nychtbours within the samyn, have riddye thair sensabill geir and wapenis for weir, and compeir thairwith to the said presidents at jowing of the common bell, for the keeping and defense of the toun aganis thame that wald invaid the samin. And als chaigris that all wemen, and especiallie vagaboundis, that thai pass to thair labouris and be nocht sene upoun the gait clamorand and cryand, under the pane of banishing of thair personis, but favouris, and that the uther women of gude repute pass to the kirk and pray quahane tyme requiris for our soverane lord, and his army and nychtbours being thairat, and hald thame at thair previe labouris of the gait within thair housis as efferis."

James left behind him only one legitimate child, James V. His natural issue were, Alexander, born eight months after his father's death, and who died in the second year of his age; Alexander, Archbishop of St. Andrews; Catharine, wedded to the Earl of Morton; James, Earl of Murray; Margaret, wedded to the heir of Huntly; and Jean, married to Malcolm Lord Fleming.

JAMES V. of Scotland, son of James IV., and of Margaret, eldest daughter of Henry VII., King of England, was born at Linlithgow in the month of April, 1512. This prince, on the death of his father, was not more than a year and a half old. The nation had, therefore, to look forward to a long minority, and to dread all the evils which in these turbulent times were certain to attend a protracted regency.

Scarcely any event could have been more disastrous to Scotland than the premature death of James IV. The loss of the battle of Flodden, the immense number of Scottish noblemen and gentlemen who fell in that fatal field, were calamities of no ordinary magnitude; but the death of James himself was more fatal to the peace and prosperity of the kingdom than all. By the latter event Scotland was thrown open to foreign influence and intrigue, and left to the ferocious feuds of its own turbulent and warlike chieftains, who did not fail to avail themselves of the opportunity which the death of the monarch afforded them of bringing their various private quarrels to the decision of the sword. It might have been expected that the overwhelming disaster of Flodden field, which brought grief and mourning into almost

every house of note in the land by the loss of some member of its family, would have extinguished, for a time at least, all personal animosities between them, and that a common sympathy would have prevented the few that were left from drawing their swords upon each other; but it had no such effect. Sanguinary contests and atrocious murders daily occurred throughout the whole country. They invaded each other's territories with fire and sword, burned with indiscriminating vengeance the cottage as well as the castle; despoiled the lands of corn and cattle; and retired only when driven back by a superior force, or when there was nothing more left to destroy or carry away.

Such was the condition of Scotland during nearly the whole period of the minority of James; and by merely substituting one noble name for another, and shifting from time to time the scene of their endless squabbles and skirmishes, adding an interminable and scarcely intelligible story of intrigues, duplicity, and deception, we have the history of the kingdom for the fifteen years immediately succeeding the battle of Flodden field. During this period we occasionally find the queen and her second husband, the Earl of Angus, and sometimes the Duke of Albany, cousin of the late king, in possession of the nominal regency. At length the young monarch comes upon the stage; and it is not until that event occurs that the interest of the story is resumed. It then becomes a connected and intelligible tale, and is at once relieved of the cumbrous and fatiguing narration of occurrences, digressive, episodic, and parenthetical, with which it was previously disfigured and obscured.

In the meantime the young monarch, unconscious of the storm that was raging without, was pursuing his studies in the castle of Edinburgh, where he had been placed for safety, under the tuition of Gavin Dunbar. The apartments appropriated to the youthful sovereign in this ancient fortress seem to have been in but a very indifferent condition; his master, Dunbar, though afterwards refunded, having been obliged to repair at his own cost, in the first instance, the chamber in which the king received his lessons, one particular room having been set apart for that purpose. Indeed, during the whole of Albany's regency, the wants of the young monarch seem to have been very little attended to: even his personal comfort was so much neglected, that it was with great difficulty he could procure a new doublet or a new pair of hose; and he at one time must have gone without even them but for the kindness of his natural sister, the Countess of Morton, who, from time to time, supplied him with articles of wearing apparel. The treasurer, too, frequently refused to pay the tailor for the making of his clothes, when the material instead of the dress happened to be sent him. Though placed in the castle for security, this consideration does not seem to have precluded the indulgence of going abroad occasionally. A mule was kept for him, on which he rode out during the intervals of his study, and when the town and surrounding country were reckoned sufficiently quiet and peaceful to admit of his doing so with safety. The appearance, character, and temper of the young monarch during his nonage are spoken of in warm terms by his contemporaries. In personal appearance he is said to have borne a strong resemblance to his uncle Henry VIII. of England; who, tyrant though he was, had certainly a very noble and kingly presence. James' countenance was oval, of a mild and sweet expression; his eyes blue, and beaming at once with gentleness and intelligence without effeminacy; a head of yellow hair completes the pic-

ture. He was of an exceedingly affectionate disposition, and of a generous though somewhat hasty temper. "There is not in the world," says the queen his mother, in a letter to Surrey, "a wiser child, or a better-hearted, or a more able." This is the language of a parent indeed; but, when corroborated as it is by other evidence, there is no occasion to suspect it of partiality. James was about this time in the eleventh or twelfth year of his age. With his other good qualities he discovered a shrewdness and sagacity superior to his years. Surrey, speaking of him to Wolsey, says, "He speaks *sure*, for so young a thing." The young monarch was much addicted to all manly sports and exercises, and in all excelled. He rode gracefully, was passionately fond of the chase, and took much delight in hawks, hounds, and all the other appurtenances belonging to that amusement. He also sang and danced well, and even in his boyish years felt much of that "stern joy" which noble minds feel in possessing and handling implements of war. He was delighted with arms and armour; and could draw a sword a yard long before the hilt, when buckled to his side, as well as a full-grown man. His own weapon was of this length when he was only twelve years of age. James was altogether at this period of his life a noble and princely boy. His amusements were all of a manly character. His mind was generous and elevated, his mien and carriage gallant and dignified. In short, imagination cannot conceive a more striking image of a youthful monarch in a rude and warlike age, than is presented to us in the person and character of James V. of Scotland. There is some reason, however, to believe, that the royal coat was a little wild, and that he was fully as fond of tilting with the spear, or making the forest of Ettrick ring with his bugle-notes, as of studying his humanities, for his Latinity was found to be sadly defective.

He seems to have kept Stirling Castle, the place where he last resided before assuming the reins of government, in something like an uproar, while he lived in it, with his sports and amusements. He was generally joined in these by his domestics; and as they were pretty numerous, we may readily conceive what a noise and turmoil they would create, led on in their wild and obstreperous frolics by their bold and lively young leader. Pelting each other with eggs is known to have been a favourite pastime, and it is one certainly which must have given rise to many of the most ludicrous scenes. Although the estates of the kingdom had fixed the eighteenth year of his age as that which should terminate the minority of James, and put him in full and uncontrolled possession of the sovereignty of the kingdom, he was called upon to take his seat on the throne at a much earlier period of life. The lords themselves, whose feuds and quarrels had filled the country with slaughter and rapine, saw no other way of terminating the frightful scene but by calling on the king, young as he was, to assume the royal dignity. The ambition of his mother, who hoped to possess herself of the real power and authority, also contributed to facilitate the event; and, accordingly, the boy king, for he was only twelve years of age, was brought, escorted by a numerous train of nobles, from Stirling Castle to Holyrood House. On first learning the resolution to which the lords had come of investing him with the royal character, he expressed much delight, and seemed filled with the most joyful anticipations. "He *was weill content*," says Lindsay, "to leve correction at the scooles, and pas to his lordis at libertie."

Amongst the first things which the young monarch did on arriving at Holyrood, was to change all the

officers of the royal household, from the treasurer down to the carvers. Three noblemen, the Earl of Lennox, the Lords Hamilton and Angus, and Archbishop Beaton, were appointed as his guardians and advisers. For a year after his arrival in Edinburgh and assumption of the royal dignity, the king and his guardians lived happily, and Lindsay says merrily together; but at the end of that period, a "benefice vaiket," a temptation came in the way, and destroyed the harmony of the association; each claimed it from the king, and each thought he had a better right to it than his fellow. Angus said that he was always scarce of hay and horse corn when he came to Edinburgh, and that therefore it should be given to him. The vacant benefice was attached to Holyrood House. Whether it was the force of this appeal, or the superior influence of Angus over the royal mind, that decided the point, is left unexplained; but that nobleman carried off the prize, to the great disappointment and displeasure of the other three, who shortly after retired in disgust from the court. Lennox, who had got nothing at all, returned, in despair of gaining anything by the royal favour, to his own country; and Hamilton, though he had procured the abbacy of Paisley for his son, thinking that he had not got enough, followed his example. Beaton, who lived then in a house of his own in the Friar's Wynd, refrained afterwards from going near the court, but when expressly sent for.

Although James was now placed upon the throne, and surrounded with all the insignia of royalty, he neither of himself assumed nor was permitted to assume the functions of the royal state. He was much too young to be capable of holding the reins of government, and there were those around him who were not desirous that he should. Nor does it appear that the young monarch cared much about the matter, so long as he was permitted to enjoy himself; and there is no reason to believe that the defection of his grave guardians sank very deep into his mind. As the king advanced in years, however, this indifference to the power and authority of his elevated station gradually gave way to the natural ambition of enjoying them; and he at length determined to rid himself of the thralldom under which he was kept by the Earl of Angus, who had for several years exercised the royal authority in his name. The house of Douglas, however, was too powerful, and their influence too extensive, to admit of his effecting his emancipation by any open effort; he therefore determined to have recourse to secret measures in the first instance.

The young king was now in the seventeenth year of his age, and when he carried his design into execution was residing at Falkland, a favourite hunting-place of the kings of Scotland. Here he was attended as usual by the Earl of Angus and several of his kindred, all of whom were united in the design of keeping the king, as it were, to themselves. A Douglas was captain of his guard; a Douglas was treasurer; and a Douglas was guardian and adviser. Great numbers of that name, besides, filled subordinate situations in the royal household, and the king's guard, consisting of a hundred gentlemen, were all in the interest of the Earl of Angus and his family. Thus encompassed, the young monarch had no other resource than to endeavour to elude their vigilance. He was under no personal restraint, nor was he debarred from any enjoyment or amusement with which he chose to occupy himself. On the contrary, they all led an exceedingly merry and joyous life together; were almost daily out hunting and hawking and feasting with the neighbouring noblemen and gentlemen, and amongst the rest with the Archbishop of

St. Andrews, who entertained the king and his attendants with great "mirrines" for several days together; but it was necessary that a Douglas should always be present on these occasions. Hunting, hawking, or feasting, still a Douglas must be there. An opportunity such as the young monarch had long and anxiously looked for of escaping from this annoying surveillance at length presented itself, and he availed himself of it. The Earl of Angus left Falkland for a few days, to transact some private business of his own in the Lothians, leaving the king in charge of his uncle Archibald Douglas, and his brother George. These two, however, availing themselves probably of the earl's absence, also left the palace on different errands; the former, it is hinted, to visit a mistress in Dundee, and the latter to arrange some business with the Archbishop of St. Andrews. There was still, however, a fourth left, whom it was necessary the king should dispose of before he could effect his escape; this was James Douglas of Parkhead, the captain of the guard, to whom the absentees in the last resort had confided the safe-keeping of the young monarch. In order to get rid of him, the king gave out that he intended to go a hunting early on the following morning, and having sent for James Douglas to his bedroom, he called for liquor, and drinking to his guest, remarked that he should see good hunting on the morrow. Douglas, little dreaming of the equivocal, saw the king safely to bed, and retired to his own, by the advice of his master, much earlier than usual, that he might be up betimes in the morning, the king having ordered dejeuner to be served at four o'clock. It is not improbable that his majesty, moreover, had made him take an extra cup before they parted. As soon as all was quiet in the palace, the king got up, disguised himself by putting on the dress of one of his own grooms, and descended to the stables, where "Jockie Hart," a yeoman of the stable, with another trusty servant, also in the secret, were ready prepared with saddled horses for the intended flight.

They all three instantly mounted, and escaping all notice from the wardens, took the road for Stirling at full gallop. On reaching the castle, which he did by break of day, the king ordered the gates to be shut, and that no one should be permitted to enter without his special order. This done, he retired to bed, much fatigued with his long and rapid ride. His escape from Falkland was not discovered until the following morning. George Douglas had returned to the palace at eleven o'clock at night, about an hour after the king's departure, but having learned from the porters that his majesty was asleep in his own apartment, he, without further inquiry, retired to bed; and it was not until he was roused at an early hour of the morning, by Patrick Carmichael, bailie of Abernethy, who had recognized the king in his flight, and who came with all manner of despatch to inform him of it, that he knew anything at all about the matter. He would not at first believe it, but rushed in great alarm to the king's chamber, which he found locked, and it was only when he had burst up the door, and found the apartment unoccupied, that he felt assured of the dreadful truth. The king must have already acquired some little reputation for that gallantry amongst the ladies which afterwards so much distinguished him, for on this occasion he was at first suspected to have gone off on a nocturnal visit to a lady at Bambrigh, some miles distant from Falkland.

Immediately after his arrival in Stirling, the king summoned a great number of his lords to join him there, to assist him with their advice and counsel. The summons was readily obeyed, both from personal

attachment to the king, and a jealousy and dislike of his late guardian the Earl of Angus. In a few days James was surrounded with nearly a score of the noblest names in the land, all ready to perish in his defence, and to assert and maintain his rights at the point of the sword.

He seems to have resented highly the restraint in which he had been kept by Angus and his kindred, for it was now he said, addressing the assembled lords, "I avow that Scotland shall not hold us both till I be revenged on him and his." The Earl of Angus and all his immediate friends were now put to the horn, and the former deprived of all his public offices. It is therefore at this period that the actual reign of James commences, and not before. He was now freed from the influence of the Douglasses, surrounded by his nobles, who paid him a ready and willing homage, and was in every respect an independent and absolute sovereign, capable and at liberty to judge and to act for himself.

James' appearance and character were as interesting as his situation at this period of his life. He was now, as stated before, in the seventeenth year of his age, of a robust constitution, which enabled him to encounter any bodily fatigue. His speech and demeanour were mild and conciliating. His stature was of middling height, but handsomely formed, and "the fient a pride, nae pride had he." He spoke at all times affably to the meanest of his subjects, and would partake of the humblest repast of the humblest peasant in his dominions, with a glee and satisfaction which evinced the most amiable kindness of disposition. These qualities rendered him exceedingly beloved by the common people, of whom he was always besides so steady and effective a friend, as procured for him the enviable title of King of the Poor.

Amongst the first cares of James after his becoming possessed of the actual sovereignty of the kingdom, was to subdue the border thieves and marauders, who were carrying matters with a high hand, and had so extended their business during the lawless period of his minority, and so systematized their proceedings, that Armstrong of Kilnockie—the celebrated Johnnie Armstrong of the well-known old ballad—one of the most noted leaders of these predatory bands, never travelled abroad, even on peaceful purposes, without a train of six and twenty gentlemen well mounted, well armed, and always handsomely dressed in the gayest and most chivalrous garb of the times. As James, however, knew that he would have little chance of laying hold of these desperadoes if he sought them with openly hostile intentions, their predatory habits and intimate knowledge of the localities of the country rendering it easy for them to evade any such attempt, he had recourse to stratagem. He gave out that he intended to have a great hunting match on the borders, and really did combine both sport and business in the expedition which followed. As was usual with the Scottish kings on hunting occasions, he summoned all the noblemen and gentlemen in the country, who could find it convenient, to attend him with their dogs on a certain day at Edinburgh, and, what was not so customary, to bring each a month's victuals along with him. Such a provision was always required when an army of common men were called together, but not in the case of convocations of men above that rank. The expedition in this case, however, was to be both warlike and sportive; and the former might prevent the latter from affording them a sufficiency of game for their subsistence. The summons of the king for the border hunting was so willingly obeyed, that a host amounting to 12,000 assembled in Edin-

burgh against the appointed time; and amongst these, some chieftains from very distant parts of the country, such as Huntly, Argyle, and Athol, all of whom brought their large fierce Highland deer-dogs along with them to assist in the chase. It was in the month of June, 1529, that this prodigious host of sportsmen, headed by the king in person, set out towards the borders. The greater part of them were well armed, and were thus prepared for anything that might occur. On all such occasions pavilions, tents, bedding, &c., for the accommodation of the sportsmen, were despatched some days previous to the ground selected for the first day's amusement, and were afterwards moved from place to place as the scene of action was shifted. The king's pavilion was very splendid, and might readily be distinguished from all others by its superior richness and elegance. His dogs, too, were elevated above all the dogs of meaner men, as well by their extrinsic ornaments as by their intrinsic merits. Their collars were gilt, or were of purple velvet adorned with golden studs, while the royal hawks were provided with collars and bells of the same metal. The cavalcade having reached Meggotland, on the southern border of Peeblesshire, a favourite hunting-place of James', and which was always reserved exclusively for the king's hunting—the sport began, and in a few days no less than 360 deer were slain. Soon after this, Armstrong of Kilnockie, little dreaming of the fate that awaited him, made his appearance among the sportsmen, at a place called Caerlanrig, it is said by invitation, but whether it was so or not he seems to have calculated on at least a civil if not a cordial reception from the king, being in total ignorance of the real object of the king's visit to the borders. Armstrong was not altogether unreasonable in such an expectation, for his robberies had always been confined to England, and he was rather looked upon as a protector than otherwise by his own countrymen, none of whose property he was ever known to have meddled with. He always "quartered upon the enemy," and thought that by doing so he did good service to the state; but not being consulted in the various treaties of peace which occasionally took place between the sovereigns of the two kingdoms, he did not always feel himself called upon to recognize them, and accordingly continued to levy his black-mail from the borders all the way, it is said, unto Newcastle. Though the king had made peace with England, Johnnie Armstrong had not; and he therefore continued to carry on the war in defiance of all those treaties and truces to which he was not a party. On this occasion the daring borderer, expecting a gracious reception from the king, and desirous of appearing before his sovereign in a manner becoming what he conceived to be his own rank, presented himself and his retainers, all magnificently apparelled, before his majesty. The king, who did not know him personally, at first mistook him for some powerful nobleman, and returned his salute; but on learning his name, he instantly ordered him and all his followers to be taken into custody and hanged upon the spot. "What wants that knave that a king should have," exclaimed James, indignantly struck with the splendour of Armstrong's and his followers' equipments, and, at the same time, turning round from them on his heel as he spoke. The freebooter at first pleaded hard for his life, and endeavoured to bribe the king to spare him. He offered his own services and that of forty men at any time, when the king should require it, free of all expense to his majesty. He further offered to bring to him any subject of England—duke, earl, lord, or baron, against any given day, either dead or alive, whom his majesty

might desire either to destroy or to have as a captive. Finding that all he could say and all he could offer had no effect in moving the king from his determination, the bold borderer, seeing the die was cast and his fate sealed, instantly resumed the natural intrepidity of his character,—"I am but a fool," he said, raising himself proudly up, "to look for grace in a graceless face. But had I known, sir, that you would have taken my life this day, I should have lived upon the borders in despite of both King Henry and you; and I know that the King of England would down-weigh my best horse with gold to be assured that I was to die this day." No further colloquy took place; Armstrong and all his followers were led off to instant execution. A popular tradition of the borders, where his death was much regretted, says, that the tree on which Armstrong was executed, though it continued to vegetate, never again put forth leaves. After subjecting several other notorious offenders to a similar fate, the king returned to Edinburgh on the 24th of July. In the following summer he set out upon a similar expedition to the north, with that which he had conducted to the south, and for similar purposes—at once to enjoy the pleasures of the chase, and to bring to justice the numerous and daring thieves and robbers with which the country was infested.

This practice of converting the amusement of hunting into a means of dispensing justice throughout the kingdom, was one to which James had often recourse, for on these occasions he took care always to be attended with an armed force, sufficiently strong to enforce the laws against the most powerful infringer; and he did not spare them when within his reach. For thieves and robbers he had no compassion; common doom awaited them all, whatever might be their rank or pretensions. In this particular he was stern and inflexible to the last degree; and the times required it. There was no part of his policy more beneficial to the kingdom than the resolute, incessant, and relentless war which he waged against all marauders and plunderers.

On the expedition which he now undertook to the north, he was accompanied by the queen mother and the papal ambassador then at the Scottish court. The Earl of Athol, to whose country the royal party proposed first proceeding, having received intelligence of the visit which he might expect, made the most splendid preparation for their reception. On the arrival of the illustrious visitors, they found a magnificent palace, constructed of boughs of trees, and fitted with glass windows, standing in the midst of a smooth level park or meadow. At each of the four corners of this curious structure there was a regularly formed tower or block-house; and the whole was joisted and floored to the height of three stories. A large gate between two towers, with a formidable portcullis, all of green wood, defended the entrance; while the whole was surrounded with a ditch sixteen feet deep and thirty feet wide, filled with water, and stocked with various kinds of fish, and crossed in front of the palace by a commodious drawbridge. The walls of all the apartments were hung with the most splendid tapestry, and the floors so thickly strewn with flowers, that no man would have known, says Lindsay, but he had been in "ane greine gardeine." The feasting which followed was in keeping with this elaborate and costly preparation. Every delicacy which the season and the country could supply was furnished in prodigious quantities to the royal retinue. The choicest wines, fruits, and confections were also placed before them with unsparing liberality; and the vessels, linen, beds, &c., with which this fairy mansion was supplied for the occasion, were all of the finest and

most costly description. The royal party remained here for three days, at an expense to their noble host of as many thousand pounds. Of all the party there was not one so surprised, and so much gratified with this unexpected display of magnificence and abundance of good living, as his reverence, the pope's ambassador. The holy man was absolutely overwhelmed with astonishment and delight to find so many good things in the heart of a wild, uncivilized, and barbarous country. But his astonishment was greatly increased when, on the eve of their departure, he saw a party of Highlanders busily employed in setting fire to that structure, within which he had fared so well and been so comfortably lodged, and which had cost so much time, labour, and expense in its erection. "I marvel, sir," he said, addressing the king, "that ye should suffer yon fair palace to be burned, that your grace has been so well entertained in." "It is the custom of our Highlandmen," replied James, smiling, "that be they never so well lodged at night they will burn the house in the morning." The king and his retinue now proceeded to Dunkeld, where they remained all night. From thence they went next day to Perth, afterwards to Dundee and St. Andrews, in all of which places they were sumptuously entertained—and finally returned to Edinburgh.

James, who had now passed his twentieth year, was in the very midst of that singular career of frolic and adventure in which he delighted to indulge, and which forms so conspicuous a feature in his character. Attended only by a single friend or two, and his person disguised by the garb of a gentleman of ordinary rank, and sometimes, if traditional tales tell truth, by that of a person of a much lower grade, he rode through the country in search of adventures, or on visits to distant mistresses; often on these occasions passing whole days and nights on horseback, and putting up contentedly with the coarsest and scantiest fare which chance might throw in the way. Sleeping in barns on "clean pease strae," and partaking of the "gude wife's" sheep-head, her oaten cakes, and ale, or whatever else she might have to offer, was no uncommon occurrence in the life of James. Such visits, however, were not always prompted by the most innocent motives. A fair maiden would at any time induce the monarch to ride a score of miles out of his way, and to pass half the night exposed to all its inclemency for an hour's interview.

James was no niggard in his gallantries: where money was required, he gave it freely and liberally; where it was not, his munificence took the shape of presents—such as rings, chains, &c., of gold and other descriptions of jewellery. In one month he gave away in this way to the value of upwards of £400. The roving monarch, however, made even his vagrancies subservient to his great object of extirpating thieves and robbers. During his wanderings he frequently fell in with numerous bands of them, or sought them out; and on such occasions never hesitated to attack them, however formidable they might be, and however few his own followers.

As the roving propensities of the king thus frequently put his life in jeopardy, and as his dying without lawful issue would have left the country in all probability a prey to civil war, the nation became extremely anxious for his marriage, an event which, after many delays, arising from political objections to the various connections from time to time proposed, at length took place. The Scottish ambassadors in France concluded, by James' authority, a marriage-treaty with Marie de Bourbon, daughter of the Duke of Vendome. On the final settlement of this treaty the young monarch proceeded to Vendome, to claim in person his affianced bride; but here his usual gal-

lantry failed him, for on seeing the lady he rejected her, and annulled the treaty.

Whether it was the result of chance, or that James had determined not to return home without a wife, this occurrence did not doom him, for any length of time, to a single life. From Vendome he proceeded to Paris, was graciously received by Francis I., and finally, after a month or two's residence at that monarch's court, married his daughter Magdalene. The ceremony, which took place in the church of Notre Dame, was celebrated with great pomp and splendour. The whole city rang with rejoicings, and the court with sounds of revelry and merriment. The marriage was succeeded by four months of continued feasting, sporting, and merry-making. At the end of that period James and his young bride, who was of an exceedingly sweet and amiable disposition, returned to Scotland; the former loaded with costly presents from his father-in-law, and the latter with a dowry of 100,000 crowns, besides an annual pension of 30,000 livres during her life.

The royal pair arrived at Leith on Whitsun-eve, at ten o'clock at night. On first touching Scottish ground, the pious and kind-hearted young queen dropped on her knees, kissed the land of her adoption, and after thanking God for the safe arrival of her husband and herself, prayed for happiness to the country and the people. The rejoicings which the royal pair had left in France were now resumed in Scotland. Magdalene was everywhere received by the people with the strongest proofs of welcome and regard, and this as much from her own gentle and affable demeanour as from her being the consort of their sovereign. Never queen made such rapid progress in the affections of a nation, and few ever acquired during any period so large a proportion of personal attachment as did this amiable lady. The object, however, of all this love, was not destined long to enjoy it. She was in a bad state of health at the time of her marriage, and all the happiness which that event brought along with it could not retard the progress of the disease which was consuming her. She daily became worse after her arrival in Scotland, and finally expired within forty days of her landing. James was for a long time inconsolable for her loss, and for a season buried himself in retirement, to indulge in the sorrow which he could not restrain.

Policy required, however, that the place of the departed queen should, as soon as propriety would admit, be supplied by another; and James fixed upon Mary of Guise, daughter of the duke of that name, and widow of the Duke of Longueville, to be the successor of Magdalene. An embassy having been despatched to France to settle preliminaries, and to bring the queen-consort to Scotland, she arrived in the latter kingdom in June, 1538. Mary landed at Balcomie in Fife, where she was received by the king, surrounded by a great number of his nobles. From thence the royal party proceeded to Dundee, St. Andrews, then to Stirling; from that to Linlithgow; and lastly to Edinburgh. In all of these places the royal pair were received with every demonstration of popular joy, and were sumptuously entertained by the magistrates and other authorities of the different towns. James, by a long and steady perseverance in the administration of justice without regard to the wealth or rank of the culprits, and by the wholesome restraint under which he held the turbulent nobles, had now secured a degree of peace and prosperity to the country which it had not enjoyed for many years before. His power was acknowledged and felt in the most remote parts of the Lowlands of Scotland, and even a great part of the Highlands. But the Western Isles and the most northern extremity of the

kingdom, places then difficult of access and comparatively but little known, were still made the scenes of the most lawless and atrocious deeds by the fierce and restless chieftains and their clans, by whom they were inhabited. James, however, resolved to carry and establish his authority even there. He resolved to "beard the lion in his den;" to bring these desperadoes to justice in the midst of their barbarous hordes; and this bold design he determined to execute in person. He ordered twelve ships, well provided with artillery, to be ready against the 14th of May. The personal preparations of the king, and those made for his accommodation in the ship in which he was himself to embark on this expedition, were extensive and multifarious. His cabin was hung with green cloth, and his bed with black damask. Large quantities of silver plate and culinary utensils, with stores for cooking, were put on board; and also a vast number of tents and pavilions, for the accommodation of his suite when they should land in the isles. The monarch himself was equipped in a suit of red velvet, ornamented with gold embroidery, and the ship in which he sailed was adorned with splendid flags and numerous streamers of red and yellow serge.

The expedition, which had been delayed for fourteen days beyond the time appointed by the advanced state of the queen's pregnancy, finally set sail for its various destinations in the beginning of June.

The royal squadron, on reaching the western shores, proceeded deliberately from island to island, and from point to point of the mainland, the king landing on each, and summoning the various chieftains to his presence. Some of these he executed on the spot, others he carried away with him as hostages for the future peaceful conduct of their kinsmen and followers; and thus, after making the terror of his name and the sternness of his justice felt in every glen in the Highlands, he bent his way again homewards. James himself landed at Dumbarton, but the greater part of his ships, including those on board of which were the captured chieftains, were sent round to Leith.

Having now reduced the whole country to such a state of tranquillity, and so effectually accomplished the security of private property everywhere, that it is boasted that at this period of his reign flocks of sheep were as safe in Ettrick Forest as in the province of Fife, he betook himself to the improvement of his kingdom by peaceful pursuits. He imported superior breeds of horses to improve the native race of that animal. He promoted the fisheries, and invited artisans and mechanics of all descriptions to settle in the country, encouraging them by the offer of liberal wages, and in many cases by bestowing small annual pensions. With every promise of a long and happy reign, and in the midst of exertions which entitled him to expect the latter, the cup was suddenly dashed from his lips. Misfortune on misfortune crowded on the ill-starred monarch, and hurried him to a premature grave. Two princes who were born to him by Mary of Guise, died in their infancy within a few days of each other, a calamity which sank deep in the heart of their royal parent. His uncle, the King of England, with whom he had hitherto been on a friendly footing, for reasons now not very well known, invaded his dominions with an army of 20,000 men, under the command of the Duke of Norfolk. James gave orders to assemble an army of 30,000 men on the Borough Muir, and with this force he marched to oppose them. The hostile armies met at Solway Moss, but with little disposition on the part of the leaders of the Scottish army to maintain the credit

of their sovereign by their arms. James had never been friendly to the aristocracy, and they now retaliated upon him by a lukewarmness in his cause in the hour of need. The unfortunate monarch himself increased this spirit of defection at such a critical juncture by appointing Oliver Sinclair, a mean favourite, and a man of no ability, to the command of his army. The intelligence of this appointment excited the utmost indignation in the Scottish army. All declared that they would rather submit to be taken prisoners by the English than be commanded by such a general; and they were thrown into such a state of commotion by this infatuated proceeding of their sovereign, that the English general perceived the disorder, and taking advantage of it, attacked the Scottish army with a few hundred light horse. The former making no resistance were instantly put to flight. James was at Caerlaverock, about twelve miles distant, when this disaster took place. When informed of the disgraceful flight of his army, he sank into a state of dejection and melancholy from which nothing could rouse him. His proud spirit could not brook the disgrace which had befallen his arms, and the conduct of his nobles excited a degree of irritation which soon threw him into a violent fever. In this state of despondency he retired to Falkland. Here he took to bed and refused all sustenance. While in this condition intelligence was brought him that the queen, then at Linlithgow, was delivered of a girl. "It came with a lass and it will go with a lass," said the dying monarch, reckoning it another misfortune that it was not a male heir that had been given to him.

A little before his death, which was now fast approaching, he was heard muttering the words "Solway Moss," the scene of that disaster which was now hurrying him to the grave. On the day of his death, which happened previous to the 13th of December, 1542, but within two or three days of it, although the precise day is not known, he turned round to the lords who surrounded his bed, and with a faint but benignant smile, held out his hand to them to kiss, and in a few minutes thereafter expired. James died in the thirty-first year of his age, leaving the unfortunate Mary, then an infant, to succeed to his dignities and to more than his misfortunes. Besides Mary, his only surviving legitimate child, James left six natural children. These were—James, abbot of Kelso and Melrose; the Regent Moray; Robert, prior of Holyrood House; John, prior of Coldingham; Janet, wife of the Earl of Angus; and Adam, prior of the Chartreux at Perth.

JAMES VI. of Scotland, and I. of England, was born in the castle of Edinburgh, June 19, 1566. He was the son of the reigning sovereign Mary, by her husband Henry Lord Darnley, who was nominally associated with her in the government, and was the eldest son of the existing Earl of Lennox. Both by his father and mother James was the great-grandson of Henry VII. of England, and, failing Queen Elizabeth and his own mother, stood nearest to the throne of that kingdom at the same time that he was heir-apparent to the Scottish crown. The character of his parents and their previous history are so well known that it is unnecessary to touch upon them here. It may only be mentioned, that while the royal infant brought with him into the world pretensions the most brilliant that could have befallen a mortal creature, he also carried in his constitution a weakness of the most lamentable nature, affecting both his body and his mind. About three months before his birth his father headed a band of conspirators who broke violently into the privacy of his

mother's chamber, and almost in her presence slew her favourite counsellor David Riccio. The agitation of the mother on that occasion took effect upon the child, who, though intended apparently to be alike strong in mental and bodily constitution, showed through life many deficiencies in both respects, though perhaps to a less extent than has been represented by popular history.

It is well known that a confederation of the Scottish nobles dethroned Mary about a year after the birth of her son. While this ill-fated princess was condemned to imprisonment in Lochleven Castle, her son was taken to Stirling, and there crowned at the age of thirteen months and ten days. The real government was successively administered by the regents Moray, Lennox, Mar, and Morton, under the secret direction of the English queen, by whom, in time, her rival Mary was put to death. James, after a weakly infancy, was placed under the care of the celebrated Buchanan, whose religious principles and distinguished scholarship seemed to qualify him peculiarly for the task of educating a Protestant prince. It would appear that the young king received at the hands of his master a great deal more learning, classical and theological, than he was able to digest, and thus became liable to as much of the fault of pedantry as consists in a hoarding of literature for its own sake, or for purposes of ostentation, accompanied by an inability to turn it to its only true use in the ordinary purposes of life. A pliability of temper, subject alike to evil and to good influences; a sly acuteness in penetrating the motives of men, without the power to make it of any practical advantage; and a proneness to listen to the flattering counsellors who told him he was a king, and ought to have the power of one, were other characteristics of this juvenile monarch; whose situation, it must at the same time be acknowledged, was one of such difficulty as to render a fair development of the best faculties of the mind, and the best tendencies of the heart, hardly to be expected.

Though made and upheld as a king, in consequence of a successful rebellion against the monarchical principle, James was early inspired with a high sense of his royal powers and privileges, probably by some of those individuals who are never wanting around the persons of young princes, let their education be ever so carefully conducted. Even before attaining the age of twelve he had become the centre of a little knot of courtiers, who clustered about him at his residence in Stirling Castle, and plotted schemes for transferring the reins of government into his own hands. Morton permitted himself to be surprised in 1578 by this party, who for some time conducted the affairs of state in the name of the king as if he had been in full possession of his birth-right. Morton, however, soon after regained nearly all his wonted ascendancy, and it was not till two or three years later that the king became completely emancipated from this powerful agent of the English queen. A young scion of nobility, named Captain Stuart, from his commanding the king's guards, and Esme, Earl of Lennox, the king's cousin, were his chief instruments in obtaining the sovereign power, and in raising that prosecution against Morton which ended in his execution, June 2, 1581. The former is represented as a profligate adventurer, who studied only how, by flattering the king and enforcing his despotic views, to promote his own interest. Lennox was a gentler and worthier person, but was obnoxious to popular odium on account of his professing the Catholic faith. The Protestant and English interest soon rallied, and in August, 1582, took place the celebrated Raid of Ruthven, by which a

few Presbyterian nobles, headed by the Earl of Gowrie, were enabled to take possession of the royal person, and use his authority for some time in behalf of liberal government and their own religious principles, while Stuart and Lennox were forbidden his presence.

It was not till June, 1583, that James emancipated himself from a control which, however well he appeared to bear it, was far from agreeable to him. Lennox had now been banished to France, where he died of a broken heart; Stuart was created Earl of Arran on the ruins of the Hamilton family, and became almost sole counsellor to the young monarch. The nobles who had seized the king at Ruthven were pardoned; but Gowrie, having soon after made a second and unsuccessful attempt, was beheaded at Stirling. During the interval between June, 1583, and November, 1585, the government was of a decidedly anti-popular and anti-Presbyterian character, Arran being permitted to act entirely as he pleased. The Presbyterian nobles, however, who had fled into England, were, at the latter period, enabled by Elizabeth to invade their own country with such a force as overturned the power of the unworthy favourite, and re-established a system agreeable to the clergy and people, and more closely respondent to the wishes of Elizabeth. In this way James grew up to man's estate.

In 1584, when eighteen years of age, he made his first appearance as an author by publishing a small thin quarto, entitled *Essays of a Prentice in the Divine Art of Poesie, with the Reulis and Cauteles to be pursued and avoided*. This work consists of a mixture of poetry and prose; the poems being chiefly a series of sonnets, which bear very much the appearance of school exercises, while the prose consists of a code of laws for the construction of verse according to the ideas of that period. There is little in the king's style or his ideas to please the present age; yet, compared with the efforts of contemporary authors, these poems may be said to bear a respectable appearance.

The main effect of the late revolution was to re-establish the English influence, which had been deranged by the ascendancy of Captain Stuart. In June, 1586, James entered into an arrangement with Elizabeth, by which, in consideration of a pension of £5000, rendered necessary by his penurious circumstances, he engaged to support England against the machinations of the Catholic powers of Europe. It was also part of this treaty that a correspondence which he had entered into with his mother should be broken off; and he even submitted so far to the desires of his new superior as to write a disrespectful letter to that unhappy princess, who replied in an eloquent epistle, threatening to denounce him as a usurper, and load him with a parent's curse. James, in reality, during the whole of his occupancy of the Scottish throne, was a mere tool in the hands of one party or another, and had no personal influence or independence whatever till the advanced age of Elizabeth gave him near hopes of the English crown.

In 1588, while the shores of England were threatened with the Spanish Armada, James fulfilled, as far as he could, the treaty into which he had entered with Elizabeth, by using his best exertions to suppress the movements of a powerful Catholic party among his own subjects in support of the invasion. In return for this Elizabeth permitted him to take a wife; and his choice ultimately fell upon the Princess Anne of Denmark, second daughter of the deceased Frederick II. He was married by proxy in August, 1589; but the princess, having been delayed in Norway by a storm, which threatened to detain her for the winter, he gallantly crossed the seas to

Upsala, in order to consummate the match. After spending some months at the Danish court, he returned to Scotland in May, 1590; when the reception vouchsafed to the royal pair was fully such as to justify an expression used by James in one of his letters, that "a king with a new married wyfe did not come hame every day."

The king had an illegitimate cousin, Francis, Earl of Bothwell, who now for some years embittered his life by a series of plots and assaults for which there is no parallel even in Scottish history. Bothwell had been spared by the king's goodness in 1589 from the result of a sentence for treason passed on account of his concern in a Catholic conspiracy. Soon after James returned from Denmark it was discovered that he had tampered with professing witches to take away the king's life by necromancy. He at first proposed to stand a trial for this alleged offence, but subsequently found it necessary to make his escape. His former sentence was then permitted to take effect, and he became, in the language of the times, a broken man. Repeatedly, however, did this bold adventurer approach the walls of Edinburgh, and even assail the king in his palace; nor could the limited powers of the sovereign either accomplish his seizure, or frighten him out of the kingdom. He even contrived at one time to regain his place in the king's council, and remained for several months in the enjoyment of all his former honours, till once more expelled by a party of his enemies. The king appears to have purposely been kept in a state of powerlessness by his subjects; even the strength necessary to execute the law upon the paltriest occasions was denied to him; and his clergy took every opportunity of decrying his government, and diminishing the respect of his people, lest, in becoming stronger or more generally revered, he should have used his increased force against the liberal interest and the Presbyterian religion. If he could have been depended upon as a thorough adherent of these abstractions, there can be no doubt that his Scottish reign would have been less disgraced by the non-execution of the laws. But then, was his first position under the regents and the Protestant nobles of a kind calculated to attach him sincerely to that party? or can it be decidedly affirmed that the zeal of the clergy of those rough and difficult times was sufficiently tempered with human kindness to make a young prince prefer their peculiar system to one which addressed him in a more courteous manner, and was more favourable to that regal power, the feebleness of which had hitherto seemed the cause of all his distresses and all his humiliation?

In 1585, while under the control of Arran, he had written a paraphrase and commentary on the Revelation of St. John, which, however, was not completed or published for some years after. In 1591 he produced a second volume of verse, entitled *Poetical Exercises*, in the preface to which he informs the reader, as an apology for inaccuracies, that "scarcelie but at stolen moments had he leisure to blenk upon any paper, and yet nocht that with free unvexed spirit." He also appears to have at this time proceeded some length with his translation of the psalms into Scottish verse. It is curious that, while the king manifested in his literary studies both the pure sensibilities of the poet and the devout aspirations of the saint, his personal manners were coarse, his amusements of no refined character, and his speech rendered odious by common swearing.

It is hardly our duty to enter into a minute detail of the oscillations of the Scottish church during this reign between Presbytery and Episcopacy. In proportion as the king was weak the former system pre-

vailed; and in proportion as he gained strength from the prospect of the English succession and other causes, the episcopal polity was re-imposed. We are also disposed to overlook the troubles of the Catholic nobles—Huntly, Errol, and Angus, who, for some obscure plot in concert with Spain, were punished to as great an extent as the personal favour of the king, and his fear of displeasing the English Papists, would permit. The lenity shown by the king to these grandes procured him the wrath of the church, and led to the celebrated tumult of the 17th December, 1506, in which the clergy permitted themselves to make so unguarded an appearance, as to furnish their sovereign with the means of checking their power without offending the people.

In February, 1594, a son, Prince Henry, was born to the king at Stirling Castle; this was followed some years after by the birth of a daughter, Elizabeth, whose fate as the Queen of Bohemia, and ancestress of the present royal family of Britain, gives rise to so many varied reflections. James wrote a treatise of counsel for his son, under the title of *Basilicon Doron*, which, though containing some passages offensive to the clergy, is a work of much good sense, and conveys, upon the whole, a respectable impression at once of the author's abilities and of his moral temperament. It was published in 1599, and is said to have gained him a great accession of esteem among the English, for whose favour of course he was anxiously solicitous.

Few incidents of note occurred in the latter part of the king's Scottish reign. The principal was the famous conspiracy of the Earl of Gowrie and his brother, sons of the earl beheaded in 1584, which was developed—if we may speak of it in such a manner—on the 5th of August, 1600. This affair has of late been considerably elucidated by Robert Pitcairn, Esq., in his laborious work, the *Criminal Trials of Scotland*, though it is still left in some measure as a question open to dispute. The events, so far as ascertained, were as follows:—

Early on the morning of the 5th of August, 1600, Alexander, master of Ruthven, with only two followers, Andrew Henderson and Andrew Ruthven, rode from Perth to Falkland, where King James was at that time residing. He arrived there about seven o'clock, and stopping at a house in the vicinity of the palace, sent Henderson forward to learn the motions of the king. His messenger returned quickly with the intelligence that his majesty was just departing for the chase. Ruthven proceeded immediately to the palace, where he met James in front of the stables. They spoke together for about a quarter of an hour. None of the attendants overheard the discourse, but it was evident from the king's laying his hand on the master's shoulder, and clapping his back, that the matter of it pleased him. The hunt rode on, and Ruthven joined the train; first, however, despatching Henderson to inform his brother that his majesty was coming to Perth with a few attendants, and to desire him to cause dinner to be prepared. A buck was slain about ten o'clock, when the king desired the Duke of Lennox and the Earl of Mar to accompany him to Perth, to speak with the Earl of Gowrie. The master of Ruthven now despatched his other attendant to give the earl notice of the king's approach; and immediately afterwards James and he set off at a rate that threw behind the royal attendants, who lost some time in changing horses. When the Duke of Lennox overtook them, the king, with great glee, told him that he was riding to Perth to get a *pose* (treasure). He then asked the duke's opinion of Alexander Ruthven, which

proving favourable, he proceeded to repeat the story which that young man had told him, of his having the previous evening surprised a man with a large sum of money on his person. The duke expressed his opinion of the improbability of the tale, and some suspicion of Ruthven's purpose; upon which the king desired him to follow when he and Ruthven should leave the hall—an order which he repeated after his arrival in the Earl of Gowrie's house.

Meantime Henderson, on his arrival at Perth, found the elder Ruthven in his chamber, speaking upon business with two gentlemen. Gowrie drew him aside the moment he entered, and asked whether he brought any letter or message from his brother. On learning that the king was coming, he took the messenger into his cabinet, and inquired anxiously in what manner the master had been received, and what persons were in attendance upon his majesty. Returning to the chamber, he made an apology to the two gentlemen and dismissed them. Henderson then went to his own house. When he returned, in about an hour, the earl desired him to arm himself, as he had to apprehend a Highlander in the Shoe-gate. The master of the household being unwell, the duty of carrying up the earl's dinner devolved upon Henderson. He performed this service about half-past twelve; and afterwards waited upon the earl and some friends who were dining with him. They had just sat down when Andrew Ruthven entered, and whispered something in the earl's ear, who, however, seemed to give no heed. As the second course was about to be set upon the table the master of Ruthven, who had left the king about a mile from Perth, and rode on before, entered and announced his majesty's approach. This was the first intelligence given the inhabitants of Gowrie House of the king's visit, for Gowrie had kept not only his coming, but also the master's visit to Falkland, a profound secret. The earl and his visitors, with their attendants, and some of the citizens among whom the news had spread, went out to meet the king.

The street in which Gowrie House formerly stood runs north and south, and parallel to the Tay. The house was on the side next the river, built so as to form three sides of a square, the fourth side, that which abutted on the street, being formed by a wall, through which the entry into the interior court, or close, was by a gate. The scene of the subsequent events was the south side of the square. The interior of this part of the edifice contained, in the first story, a dining-room, looking out upon the river, a hall in the centre, and a room at the further end looking out upon the street, each of them occupying the whole breadth of the building, and opening into each other. The second story consisted of a gallery occupying the space of the dining-room and hall below, and at the street end of this gallery a chamber, in the north-west corner of which was a circular closet, formed by a turret which overhung the outer wall, in which were two long narrow windows, the one looking towards the Spy-tower (a strong tower built over one of the city gates), the other looking out upon the court, but visible from the street before the gate. The access to the hall and gallery was by a large turnpike stair in the south-east corner of the court. The hall likewise communicated with the garden, which lay between the house and the river, by a door opposite to that which opened from the turnpike, and an outward stair. The access to the chamber in which was the round closet, was either through the gallery, or by means of a smaller turnpike (called the Black Turnpike), which stood half-way betwixt the principal one and the street.

The unexpected arrival of the king caused a considerable commotion in Gowrie's establishment. Craingelt, the master of the household, was obliged to leave his sick-bed and bestir himself. Messengers were despatched through Perth to seek, not for meat, for of that there seems to have been plenty, but for some delicacy fit to be set upon the royal table. The bailies and other dignitaries of Perth, as also some noblemen who were resident in the town, came pouring in,—some to pay their respects to his majesty, others to stare at the courtiers. Amid all this confusion somewhat more than an hour elapsed before the repast was ready. To judge by the king's narrative, and the eloquent orations of Mr. Patrick Galloway, this neglect on the part of the earl seems to have been regarded as not the least criminal part of his conduct: and with justice; for his royal highness had been riding hard since seven o'clock, and it was past two before he could get a morsel, which, when it did come, bore evident marks of being hastily prepared.

As soon as the king was set down to dinner, the earl sent for Andrew Henderson, whom he conducted up to the gallery, where the master was waiting for them. After some short conversation, during which Gowrie told Henderson to do anything his brother bade him, the younger Ruthven locked this attendant into the little round closet within the gallery chamber, and left him there. Henderson began now, according to his own account, to suspect that something wrong was in agitation, and set himself to pray in great perturbation of mind. Meanwhile the Earl of Gowrie returned to take his place behind the chair of his royal guest. When the king had dined, and Lennox, Mar, and the other noblemen in waiting had retired from the dining-room to the hall to dine in their turn, Alexander Ruthven came and whispered to the king to find some means of getting rid of his brother the earl, from whom he had all along pretended great anxiety to keep the story of the found treasure a secret. The king filled a bumper, and drinking it off, desired Gowrie to carry his pledge to the noblemen in the hall. While they were busy returning the health, the king and the master passed quietly through the hall, and ascended the great stair which led to the gallery. They did not, however, pass altogether unobserved, and some of the royal train made an attempt to follow them, but were repelled by Ruthven, who alleged the king's wish to be alone. From the gallery they passed into the chamber at the end of it, and the door of this room Ruthven appears to have locked behind him.

When the noblemen had dined they inquired after their master, but were informed by Gowrie that he had retired and wished to be private. The earl immediately called for the keys of the garden, whither he was followed by Lennox and part of the royal train; whilst Mar with the rest remained in the house. John Ramsay, a favourite page of the king, says in his deposition, that, on rising from table, he had agreed to take charge of a hawk for one of the servants, in order to allow the man to go to dinner. He seems while thus engaged to have missed Gowrie's explanation of the king's absence, for he sought his majesty in the dining-room, in the garden, and afterwards in the gallery. He had never before seen this gallery, which is said—we know not upon what authority—to have been richly adorned with paintings by the earl's father, and he stayed some time admiring it. On coming down stairs he found the whole of the king's attendants hurrying towards the outer gate, and was told by Thomas Cranstone, one of the earl's servants, that the king had rode on before. Ramsay, on hearing this, ran to the stable

where his horse was. Lennox and Mar, who had also heard the report of the king's departure, asked the porter, as they were passing the gate, whether the king were indeed forth. The man replied in the negative. Gowrie checked him with considerable harshness, and affirmed that the king had passed out by the back gate. "That is impossible, my lord," answered the porter, "for it is locked, and the key is in my pocket." Gowrie, somewhat confused, said he would return and learn the truth of the matter. He came back almost instantly, affirming positively that the king had ridden out by the back gate. The greater part of the company were now assembled on the High Street, in front of the house, waiting for their horses, and discussing how they were to seek the king. At this moment the king's voice was heard crying—"I am murdered! Treason! my lord of Mar, help! help!" Lennox and Mar, with their attendants, rushed through the gateway into the court, and up the principal stair. Sir Thomas Erskine and his brother James seized the Earl of Gowrie, exclaiming, "Traitor! this is thy deed!" Some of the earl's servants rescued their master, who was, however, thrown down in the scuffle, and refused admittance to the inner court. On recovering his feet he retired a short way; then drawing his sword and dagger, he cried, "I will be in my own house, or die by the way."

During these proceedings the king had found himself rather critically circumstanced. Alexander Ruthven, having locked the door of the gallery chamber, led the way to the round closet. James was not a little astonished when, instead of the captive he expected, he saw a man armed at all points except his head. He was more astonished when the master, putting on his hat, drew the man's dagger, and presented it to his breast, saying, "Sir, you must be my prisoner! remember my father's death!" James attempted to remonstrate, but was interrupted with "Hold your tongue, sir, or by Christ you shall die!" But here Henderson wrenched the dagger from Ruthven's hand, and the king, then resuming his remonstrances, was answered that his life was not what was sought. The master even took off his hat when the king, who, amid all his perturbation, forgot not his princely demeanour, reminded him of the impropriety of wearing it in his presence. He then requested James to give him his word not to open the window, nor call for assistance, whilst he went to bring his brother, the earl, who was to determine what farther should be done. Ruthven then left the closet, locking the door behind him; but, according to Henderson's belief, went no farther than the next room. This is more than probable; for, by the nearest calculation, Ramsay must have been at that time still in the gallery. The master re-entered, therefore, almost instantly, and telling the king there was now but one course left, produced a garter, with which he attempted to bind his majesty's hands. James freed his left with a violent exertion, exclaiming, "I am a free prince, man! I will not be bound!" Ruthven, without answering, seized him by the throat with one hand, while he thrust the other into his mouth to prevent his crying. In the struggle which ensued the king was driven against the window which overlooked the court, and at that moment Henderson thrust his arm over the master's shoulder and pushed up the window, which afforded the king an opportunity of calling for assistance. The master thereupon said to Henderson, "Is there no help in thee? Thou wilt cause us all to die!" and tremblingly, between excitement and exertion, he attempted to draw his sword. The king perceiving his intent laid hold of his hand; and thus clasped

in a death-wrestle, they reeled out of the closet into the chamber. The king had got Ruthven's head under his arm; whilst Ruthven, finding himself held down almost upon his knees, was pressing upwards with his hand against the king's face, when, at this critical moment, John Ramsay, the page, who had heard from the street the king's cry for help, and who had got before Mar and Lennox by running up the Black Turnpike formerly mentioned, while they took the principal staircase, rushed against the door of the chamber and burst it open. The king panted out when he saw his page, "Fy! strike him low, he has secret armour on." At which Ramsay, casting from him the hawk which still sat upon his hand, drew his dagger, and stabbed the master. The next moment the king, exerting all his strength, threw him from him down-stairs. Ramsay ran to a window, and called upon Sir Thomas Erskine, and one or two who were with him, to come up the turnpike. Erskine was first, and as Ruthven staggered past him on the stair, wounded and bleeding, he desired those who followed to strike the traitor. This was done, and the young man fell, crying, "Alas! I had not the wyte [blame] of it."

The king was safe for the meantime, but there was still cause for alarm. Only four of his attendants had reached him; and he was uncertain whether the incessant attempts of Mar and Lennox's party to break open the door by which the chamber communicated with the gallery, were made by friend or foe. At this moment the alarm-bell rang out, and the din of the gathering citizens, who were as likely, for anything the king knew, to side with their provost, Gowrie, as with himself, was heard from the town. There was, besides, a still more immediate danger.

Gowrie, whom we left attempting to force his way into the house, was met at the gate by the news that his brother had fallen. Violet Ruthven, and other women belonging to the family, were already wailing his death, screaming their curses up to the king's party in the chamber, and mixing their shrill execrations with the fierce din which shook the city. The earl, seconded by Cranstone, one of his attendants, forced his way to the foot of the Black Turnpike, at which spot lay the master's body. "Whom have we here?" said the retainer, for the face was turned downwards. "Up the stair!" was Gowrie's brief and stern reply. Cranstone, going up before his master, found, on rushing into the chamber, the swords of Sir Thomas Erskine, and Herries, the king's physician, drawn against him. They were holding a parley in this threatening attitude when Gowrie entered, and was instantly attacked by Ramsay. The earl fell after a smart contest. Ramsay immediately turned upon Cranstone, who had proved fully a match for the other two, and having wounded him severely, forced him finally to retreat.

All this time they who were with the Duke of Lennox had kept battering at the gallery-door of the chamber with hammers, but in vain. The partition was constructed of boards, and as the whole wall gave way equally before the blows, the door could not be forced. The party with the king, on the other hand, were afraid to open, lest they should thus give admission to enemies. A servant was at last despatched round by the turnpike, who assured his majesty that it was the Duke of Lennox and the Earl of Mar who were so clamorous for admission. The hammers were then handed through below the door, and the bolts speedily displaced. When these noblemen were admitted, they found the king unharméd amid his brave deliverers. The door, however, which entered from the turnpike had been

closed upon a body of Gowrie's retainers, who were calling for their master, and striking through below the door with their pikes and halberds. The clamour from the town continued, and the voices from the court were divided—part calling for the king, part for their provost, the Earl of Gowrie. Affairs, however, soon took a more decided turn. They who assaulted the door grew tired of their ineffectual efforts and withdrew; and almost at the same moment the voices of bailies Ray and Young were heard from the street, calling to know if the king were safe, and announcing that they were there, with the loyal burgesses of Perth, for his defence. The king gratified them by showing himself at the window, requesting them to still the tumult. At the command of the magistrates the crowd became silent, and gradually dispersed. In the course of a few hours peace was so completely re-established that the king and his company were able to take horse for Falkland.

This bird's-eye view of the occurrences of the 5th of August will be found correct in the main. Although some details have been necessarily omitted, they are sufficient to establish a preconceived scheme between the brothers against the king, but of what nature, and to what purpose, it would be difficult, without further evidence, to say. Of all the people that day assembled in Gowrie's house, not one seems to have been in the secret. Henderson, to whom an important share in the execution of the attempt had been assigned, was kept in ignorance to the last moment, and then he counteracted instead of furthering their views. Even with regard to Cranstone, the most busy propagator of the rumour of the king's departure, it is uncertain whether he may not have spread the report in consequence of the asseverations of his master; and we have his solemn declaration, at a time when he thought himself upon his death-bed, that he had no previous knowledge of the plot. The two Ruthvens of Freeland, Eviot, and Hugh Moncrieff, who took the most active share in endeavouring to stir the citizens up to mutiny to revenge the earl and his brother, may have been actuated, for any evidence we have to the contrary, solely by the feelings of reckless and devoted retainers, upon seeing their master's fall in an affray whose origin and cause they knew not. To this evidence, partly negative and partly positive, may be added the deposition of William Rynd, who said, when examined at Falkland, that he had heard the earl declare—"He was not a wise man who, having intended the execution of a high and dangerous purpose, should communicate the same to any but himself; because, keeping it to himself, it could not be discovered nor disappointed." Moreover, it does not sufficiently appear, from the deportment of the master, that they aimed at the king's life. He spoke only of making him prisoner, and grasped his sword only when the king had made his attendants aware of his situation. At the same time, it was nowhere discovered that any measures had been taken for removing the royal prisoner to a place of security; and to keep him in a place so open to observation as Gowrie House was out of the question. Without some other evidence, therefore, than that to which we have as yet been turning our attention, we can scarcely look upon these transactions otherwise than as a fantastic dream, which is incoherent in all its parts, and the absurdity of which is only apparent when we reflect how irreconcilable it is with the waking world around us.

The letters of Logan of Restalrig, which were not discovered till eight years afterwards, throw some further light upon the subject, though not so much as could be wished. Of their authenticity little doubt can be entertained, when we consider the

number and respectability of the witnesses who swore positively to their being in Logan's handwriting. It appears from these letters that Gowrie and Logan had agreed in some plot against the king. It appears also that Logan was in correspondence with some third person who had assented to the enterprise. It would almost seem, from Logan's third letter, that this person resided at Falkland: "If I kan nocht win to Falkland the first nycht, I sall be tymelie in St. Johnestoun on the morne." And it is almost certain from the fifth letter that he was so situated as to have oral communication with Gowrie, the master of Ruthven: "Pray let his lo. be quik, and bid M. A. remember on the sport he tald me." It does not appear, however, that any definite plan had been resolved upon. The sea excursion, which Mr. Lawson in his *History of the Gowrie Conspiracy* supposes to have been contemplated with the design of conveying James to Fast Castle, was only meant to afford facilities for a meeting of the conspirators with a view to deliberation. Logan's fifth letter is dated as late as the last of July, and yet it does not appear that the writer knew at that time of the Perth project. Taking these facts in conjunction with the hair-brained character of Gowrie's attempt, it seems highly probable, that although some scheme might be in agitation with Logan, and perhaps some other conspirators, the outrage of the 5th of August was the rash and premature undertaking of two hot-blooded fantastical young men, who probably wished to distinguish themselves above the rest of their associates in the plot.

The very scanty information that we possess respecting the character and previous habits of these two brothers is quite in accordance with this view of the matter, and goes a good way to corroborate it. They are allowed on all hands to have been men of graceful exterior, of winning manners, well advanced in the studies of the times, brave, and masters of their weapons. It is not necessary surely to prove at this time of day how compatible all these qualifications are with a rash and headlong temper, completely subject to the control of the imagination—a turn of mind bordering upon frenzy. A man of quick perception, warm feeling, and ungoverned fancy, is of all others the most fascinating, when the world goes smoothly; but he is of all others the most liable, having no guiding reason, to err most extravagantly in the serious business of life: being "unstable as water," he is easily irritated and lashed into madness by adverse circumstances. How much Gowrie was the dupe of his imagination, is evident from the fondness with which he clung to the delusions of the cabala, natural magic, and astrology. Armed (according to his own belief) with powers beyond the common race of man, doomed by his stars to achieve greatness, he laughed at danger, and was ready to neglect the calculations of worldly prudence alike in his aims and the means by which he sought their attainment. The true state of his brother's mind is portrayed incidentally by Logan in his first letter:—"Bot incase ye and M. A. R. forgader, because he is somwhat consety, for Godis sailk be very var with his rakelese tois of Padoa; ffor he tald me aone of the strangest taulis of ane nobill man of Padoa that ever I hard in my lyf, resembling the lyk purpose." This suggests at once the very picture of a young and hot-blooded man, whose brain had been distracted, during his residence in Italy, with that country's numerous legends of wild vengeance. Two such characters, brooding conjointly over real or fancied wrongs, were capable of projecting schemes against which the most daring would remonstrate; and, irritated by the coldness of their friends, were no doubt induced to

undertake the execution alone, and almost unassisted.

It only remains to inquire what was the object which Gowrie proposed to himself in his mad and treasonable attempt, and upon whose seconding he was to depend, suppose his design had succeeded? These two inquiries are inseparably connected, and have been rendered more interesting by a late attempt to implicate the Presbyterian party in the earl's guilt. We are not a little astonished that such an attempt should have been made at this late period, when we recollect that, notwithstanding all the ill odour in which the Presbyterian clergymen stood at court, not one of the thousand idle rumours to which Gowrie's enterprise gave birth tried to direct suspicion towards them. The sole grounds upon which such an accusation can rest for support, are the facts—that Gowrie's father was a leader among the Presbyterians, and his son strictly educated in that faith; that shortly after his arrival in Italy he wrote one letter to a Presbyterian minister; and that some of the Edinburgh clergymen manifested considerable obstinacy in throwing discredit upon the reality of the conspiracy. The two former are of themselves so weak that we pass them over the more willingly, that we shall immediately point out the motives from which Gowrie acted, and the sort of assistance upon which he really relied. The conduct of the clergymen admits of an easy explanation. James, whose perception was nearly as acute as his character was weak, was fully sensible of the ridicule to which he had exposed himself by allowing his desire of money to lead him into so shallow a device as Ruthven's. In addition to this he wished, upon all occasions, to appear as much of the hero as possible. The consequence was, that his edition of the story was so dressed up as to render it inconsistent, first, with his well-known character; secondly, with the most distant possibility of his having been deceived with the master's pretences; and, thirdly, with the depositions of the witnesses. Inconsistencies so startling were sufficient to justify some preliminary scepticism; and if ever there was an occasion where it was allowable openly to call a king's word in question, it was when James demanded, not merely that his party should hypocritically profess a belief which they did not entertain, but that they should, daringly and blasphemously, mix up this falsehood in the solemn services of devotion. A short time, however, was sufficient to convince the most incredulous of the truth of the conspiracy, stripped of the adventitious circumstances which the king linked with it; and the obstinate recusancy of Bruce the clergyman is sufficiently accounted for by James' insisting upon prescribing the manner in which he was to treat the subject, and by that individual's overstrained notions of the guilt incurred by a minister who allowed any one to dictate to him concerning the mode in which he was to conduct public worship.

But Gowrie relied upon the support of no faction, religious or political. His sole motive seems to have been a fantastic idea of the duty incumbent upon him to revenge his father's death. He is reported, on one occasion, when some one directed his attention to a person who had been employed as an agent against his father, to have said, "*Aquila non capiat muscas.*" Ruthven also expressly declared to the king when he held him prisoner in the closet, that his only object was to obtain revenge for the death of his father. The letters of Logan (except in one solitary instance, where a scheme of aggrandizement is darkly hinted at, and that as something quite irrelevant to the purpose they had on hand) harp on this string alone, proving that Gowrie and his friends

seek only "for the revange of that cawse." The only members of the conspiracy who are known to us, are men likely enough to engage in such a cause, but most unlikely to be either leaders or followers in a union where the parties were bound together by an attachment to certain political principles. The three conspirators are—the earl and his brother, such as we have already described them, and Logan of Restalrig, a broken man—a retainer and partisan of Bothwell—a maintainer of thieves and sorners—a man who expressly objects to communicating their project to one who he fears "*vill dissuade us fra our purpose with ressones of religion, quhilk I can never abyld.*" And if any more evidence were required to show how little Gowrie relied upon the Presbyterians, we might allude to his anxiety that Logan should sound his brother, Lord Home—a Catholic.

In short, everything leads us to the opinion we have already announced, that the Ruthvens were instigated to their enterprise by feelings of private revenge alone, and that they did not seek to make any political party subservient to their purposes. It is to this isolated nature of their undertaking—its utter want of connection with the political movements of the period—that we attribute the circumstance of its history having so long remained unknown, and are satisfied that much of that history must ever remain a riddle. It is with it as with the mystery of the Man in the Iron Mask, and that whole class of events which seem political merely because they befall persons who rank high in the state. They generally appear more mysterious than they really are, because, if no chance unveils them at the time, they stand too far apart from all other transactions to receive any reflected light from them.¹

On the 9th of November, 1600, was born Charles, James' second son, afterwards Charles I. of England. With that country the king now carried on a close correspondence; first, with the Earl of Essex, whom, on hearing of his imprisonment, he besought Elizabeth to spare, and afterwards with the Earl of Northumberland, Sir Robert Cecil, and other influential men, on the subject of his title to the English succession, which was generally acknowledged by the distinguished men connected with the English court.

On the 28th of March, 1603, Elizabeth expired, having named James as her successor, who was accordingly proclaimed King of England. His claim to the succession arose from his relationship to Margaret, daughter of Henry VII., who married James IV. of Scotland, great-grandfather of James VI. Immediately after Elizabeth's decease Sir Robert Carey, who had formerly been kindly entertained by James, set off on a private expedition to Scotland, to convey to the new sovereign the message. Leaving London on Thursday morning, and stopping at his estate of Witherington on the way, from which he issued orders for proclaiming James at several places in the north of England, he reached Edinburgh on Saturday night, when the king had gone to bed, but, gaining admission, saluted him as King of England. Next morning Carey was created gentleman of the bedchamber, and was at last elevated by Charles I. to the title of Earl of Monmouth. The regular messengers to James, announcing his succession, soon arrived. One of the attendants, called Davis, the king recognized as the author of a poem on the immortality of the soul, which seems to have given him high satisfaction, and promised him his patronage, which he afterwards faithfully bestowed.

On the Sunday after his accession the king attended at the High Church. After sermon he addressed the audience on his affection for his Scottish subjects; and after committing his children to the care of trusty nobles, and making arrangements for the management of Scottish business, he set off with a small number of attendants from his ancient kingdom, over which he had reigned for thirty-five years. The reception he met with on the way was very magnificent, especially at Sir Robert Cecil's, Sir Anthony Mildmay's, and Mr. Oliver Cromwell's.² In his progress many petitions were presented and granted—volumes of poems were laid before him by the university of Cambridge, and the honour of knighthood was conferred on no fewer than 237 individuals. Even in these circumstances, however, he displayed his notions of royal prerogative by ordering the recorder of Newark to execute a cut-purse apprehended on the way. On reaching London, he added to the privy-council six Scottish favourites, and also Lord Montjoy, and Lords Thomas and Henry Howard, the son and brother of the late Duke of Norfolk; and, on the 20th of May, created several peers. Numerous congratulations flowed in upon the king. The Marquis de Rosni, afterwards Duke of Sully, arrived on the 15th of June. The following sketch of James, as he appeared on this occasion to the marquis, is strong and striking:—"He was upright and conscientious; he had eloquence and even erudition—but less of these than of penetration and of the show of learning. He loved to hear discourses on matters of state, and to have great enterprises proposed to him, which he discussed in a spirit of system and method, but without any idea of carrying them into effect—for he naturally hated war, and still more to be personally engaged in it—was indolent in all his actions except hunting, and remiss in affairs—all indications of a soft and timid nature, formed to be governed." The king entertained the marquis and his attendants at dinner; when he spoke with contempt of Elizabeth—a circumstance which probably arose from the control which he was conscious she had exercised over him, and especially the idea, which he expresses in one of the documents in the negotiations on an alliance with Spain, that she was concerned in the attempts of his Scottish enemies against him—and also of a double marriage he desired between the French and English royal families.

The queen followed James a few weeks after his arrival, having on the eve of her departure quarrelled with the Earl of Mar, to whom James had committed the care of Prince Henry, and whose letter to her, advising her not to treat him with disrespect, excited the passion of that high-spirited woman. She was crowned, along with her husband, on the 25th of July, by Archbishop Whitgift, with all the ancient solemnity of that imposing ceremony. He soon after, by proclamation, called upon his subjects to solemnize the 5th of August in honour of his escape from the Gowrie conspiracy.

At the commencement of the following year was held the famous Hampton Court Conference. On the first day a few select individuals only were admitted to the king; on the following four puritan ministers, chosen by the king himself, appeared—and his majesty presided as moderator. He conversed in Latin, and engaged in dispute with Dr. Reynolds. In answer to an objection against the Apocrypha started by that learned divine, the king interpreted one of the chapters of Ecclesiasticus, according to his own ideas. He also pronounced

¹ In this account of the conspiracy and summary of the evidence, we use a masterly condensation of the matter of Mr. Pitt-Rivers's documents which appeared in the *Edinburgh Literary Journal*.

² Uncle of the Protector.

an unmeasured attack on Presbytery, which he said "agreed as well with monarchy as God and the devil."—"Stay," he added, "I pray, for one seven years, before you demand; and then, if you find me grown pursy and fat, I may perchance hearken unto you. For that government will keep me in breath, and give me work enough." On this occasion Bancroft, Bishop of London, flattered him as "such a king, as, since Christ's time, the like had not been"—and Whitgift professed to believe that his majesty spoke under the special influence of the Holy Spirit. With such flattery, is it to be greatly wondered at that the king esteemed himself an accomplished theological disputant? Indeed, the whole conference seems to have been managed in a most unreasonable manner. It was followed by a proclamation enforcing conformity, and a number of puritans, both clergy and laity, severely suffered.

In March, 1604, the king, the queen, and the prince rode in splendid procession from the Tower to Whitehall; and at the meeting of parliament, a few days after, James delivered his first speech to that assembly. One part of it excited general disapprobation—that in which he expressed himself willing to favour the Roman Catholics—a feeling on his part which probably arose from the prospects afforded him of friendship with countries so powerful as France and Spain, and also perhaps from some degree of attachment to the Romish faith, as that of his royal ancestors. At this meeting of parliament the king also brought forward his favourite proposal of a union betwixt England and Scotland, the result of which was the appointment of a committee for drawing up articles of union; one of the most zealous members of which was Sir Francis Bacon. To this great man James showed strong attachment; and even if Sir Francis had not proved himself to be devoted with peculiar ardour to the king, it may be supposed that he would have been regarded by the latter with peculiar pride from that splendid series of writings which he had already begun to publish, and of which *The Advancement of Learning*, with a very flattering dedication to the king, came forth in 1605.

A great part of the summer following the meeting of parliament the king devoted to his favourite sport of hunting—his attachment to which continued through life, even when corpulence, arising from excess in drinking, which was a noted fault of James, had unfitted him for every active exercise. About this time we find him engaged in arranging a marriage between Sir Philip Herbert and Lady Susan Vere; writing from Royston to the council that hunting was the only means to maintain his health, desiring them to take the charge and burden of affairs, and foresee that he should not be interrupted nor troubled with too much business; and inquiring into the case of Haddock, called the *sleeping preacher*, from his being said to deliver excellent sermons, and speak excellent Greek and Hebrew in the midst of sleep, although very stupid when awake, who was brought by the king to confess that the whole was an imposture. But James was soon placed in a more serious situation by the celebrated Gunpowder Plot, which was discovered on the 5th of November, for which day parliament had been summoned. A letter was found, supposed to have been written by the sister of Lord Montague, who, though approving of the conspiracy, and the wife of one of the conspirators, wished to preserve her brother from the meditated ruin. On examination barrels of gunpowder were found deposited below the place where parliament was just about to meet, and the very train and match for the discharge of their contents were in

readiness. The conspirators were with considerable difficulty discovered, and were found to comprehend some Jesuits; and to have been united by their common attachment to the Roman Catholic religion, which in England had been lately treated with increased severity. Indeed, there is much reason to believe that the plot in some degree depended on Spanish influence. At the meeting of parliament, a few days afterwards, James expatiated at great length on this terrible conspiracy; but still expressed himself indulgent to the English Catholics. Shortly after appeared a *Discourse on the Gunpowder Plot*, which is supposed to have been the composition of the king. The conspirators were condemned, and acts against the Catholics were passed in parliament; but James continued to discover his unwillingness to treat them with severity.

In July, 1606, he received a visit from the King of Denmark, who was welcomed with imposing splendour. Prince Vaudemont, a French relative of James, also paid a visit about this time to his royal kinsman. In November the king again supported before the parliament his favourite scheme of a union between his Scottish and English kingdoms. The following passages give a curious example of his mode of conversation. The circumstances are given by Harrington as having occurred about this time:—"He engaged much of learning, and showed me his own in such a sort as made me remember my examiner at Cambridge aforetime. He sought much to know my advances in philosophy, and introduced profound sentences of Aristotle, and such-like writers, which I had never read, and which some are bold enough to say others do not understand."—"The prince did now press my reading to him part of a canto in Ariosto, praised my utterance, and said he had been informed of many as to my learning in the time of the queen. He asked me what I thought pure wit was made of, and when it did best become; whether a king should not be the best clerk in his own country; and if this land did not entertain good opinion of his learning and good wisdom. His majesty did next press for my opinion touching the power of Satan in matters of witchcraft, and asked me with much gravity, if I did truly understand why the devil did work more with ancient women than others. His majesty asked much concerning my opinion of the new weed tobacco, and said it would by its use infuse ill qualities on the brain, and that no learned man ought to taste it, and wished it forbidden." After discoursing on religion, at length he said, "I pray you, do me justice in your report, and in good season I will not fail to add to your understanding in such points as I may find you lack amendment." Before this time the king had published not only his *Demonology*, but also *A Counterblast to Tobacco*.

In 1607 he published an answer to a work by Tyrone, and soon after his *Triplici Nodo Triplex Cuneus*—a defence of an oath which was imposed on foreigners by an act of parliament after the Gunpowder Plot. In 1609 he republished it, with a dedication to all Christian kings and princes, answers having been previously made to it by Bellarmine and other writers. This has been considered as among the best of the king's productions, and is characterized by a late historian of his court as "a learned defence of Protestant principles, an acute exposure of the false statements and false reasonings of Bellarmine, and a vigorous but not intemperate manifesto against papal usurpation and tyranny; yet a vain and useless ostentation of parts and knowledge: and a truer judgment, by admonishing the royal author of the incompatibility of the polemical character with

the policy and dignity of a sovereign, would have spared him the numerous mortifications and inconveniences which ensued."¹

One great cause of the king's unpopularity was his excessive favour for a Scotsman of the name of Carr. In February, 1610, at the meeting of parliament, he did not appear in person, but he had the mortification soon after, of having his plan of a union disapproved by parliament, and a supply to himself refused. They were accordingly summoned to meet the king at Whitehall, where he explained to them his singular views of royal prerogative. The same year Henry was appointed Prince of Wales, on which occasion the ceremonies were continued for three days.

In 1611 James, when on a hunting expedition, received a book on the *Nature and Attributes of God*, by Conrad Vorstius. The king selected several doctrines which he considered heresies, and wrote to the Dutch government, signifying his disapprobation—Vorstius having lately received a professorship of divinity at Leyden as successor of Arminius. He also ordered the book to be burned in London. Soon after, Bartholomew Legate was brought into his presence, accused of professing Arianism in the capital, after which he continued for some time in Newgate, and was then burned at Smithfield. About the same time a similar example of barbarous intolerance occurred. But it was in the same year that our English translation of the Bible was published—an undertaking which the king had set on foot, at the suggestion of Dr. Reynolds, in 1604, which had been executed by forty-seven divines, whom James furnished with instructions for the work; and the fulfilment of which has been justly remarked as an event of very high importance in the history of the language as well as of the religion of Great Britain. About the end of this year the king founded a college at Chelsea for controversial theology, with a view to answer the Papists and Puritans. His own wants, however, now led him to create the title of baronet, which was sold for £1000; and a man might purchase the rank of baron for £5000, of viscount for £10,000, and of an earl for £20,000. He also suffered about this time by the death of the Earl of Salisbury, whom he visited in his illness. But a domestic loss awaited him—which however, it is said, occasioned him slighter suffering than might have been expected, although the nation felt it as a painful stroke. During preparations for the marriage of the princess, the king's daughter, to the elector palatine, who arrived in England for the purpose on the 16th of October, 1612, Prince Henry was cut off by death on the 6th of November, having been taken ill the very day before the elector's arrival. This young prince was eminently distinguished by piety and honour, amiable manners and literary habits. His death-bed was cheered by the practice and consolations of the religion to which, amidst the seductions of a court, he had adhered in life, and he died, lamented by his family and country, in the nineteenth year of his age.

In February, 1613, the Princess Elizabeth was married to the elector palatine—not, it is said, without the dissatisfaction of her father. The preparations, however, were of the most splendid kind; so that means were again adopted to supply the royal wants, as also in the following year.

In 1615 James paid a visit to the university of Cambridge, where he resided in Trinity College, and was received with many literary exhibitions, in the form of disputations, sermons, plays, and orations.

In this year he wrote his *Remonstrance for the Right of Kings and the Independence of their Crowns*, in answer to a speech delivered at Paris in January by Cardinal Perron, who sent it to James. This year also occurred the celebrated trials for the murder of Overbury, in the examinations previous to which James personally engaged. He had now lost his enthusiastic attachment to Carr, the person chiefly accused of this foul deed, whom he had created Earl of Somerset, and who had lately been replaced in his affections by Villiers, the royal cup-bearer, whom he knighted, and appointed a gentleman of the bed-chamber, and whom he gradually advanced, until he was created Duke of Buckingham.

In 1617, after some changes in the court, James paid a visit to Scotland, leaving Bacon as principal administrator in his absence. On this occasion literary exhibitions were presented to him by the universities of Edinburgh and St. Andrews, and he also amused himself with his favourite sport of hunting. But he soon proceeded to enforce the customs of the English hierarchy on the Scottish people—a measure which, notwithstanding considerable encouragement from a General Assembly, convoked with a view to the proposed alterations, the nation in general deemed an infringement of a promise he had made many years before, and which they succeeded, to a considerable degree, in resisting.

The following year was marked by another act of cruelty. Sir Walter Raleigh, who had been confined in the Tower for twelve years on the charge of having been engaged in a Spanish conspiracy, but had at last obtained release from his imprisonment, was condemned and executed, in consequence of his marked misconduct in an expedition to explore a mine in Guiana which he had represented to the king as well fitted to enrich his exchequer. His execution, it will scarcely be doubted, was owing to the influence of Gondomar, the Spanish ambassador, an enemy of Raleigh at the English court, in prospect of a marriage between Prince Charles and the Spanish infanta. Soon after the queen died—a woman who seems to have been by no means destitute of estimable qualities, but still more remarkable for the splendour of her entertainments, to which Ben Jonson and other writers contributed largely of their wit. Indeed, that eminent dramatist seems to have been a person of considerable consequence at the English court. At this time James' own literary character was exhibited to the world in a folio edition of his works, edited, with a preface well seasoned with flattery, by the Bishop of Winchester. Soon after, on an application from Prince Maurice for the appointment of some English divines as members of a council for the settlement of the controversy between the Arminians and Gomarists, which was held at Dort in November, 1618, five learned men were nominated on that commission, directed by James to recommend to the contending parties the avoidance in public instruction of the controverted topics. His favour to the Church of England was manifested about the same time by his treatment of the celebrated Selden, who had written a work on "the history of tithes," in which he held the injustice of considering the alienation of what had once been church lands to any other than ecclesiastical purposes to be in every case an act of sacrilege. For this work the king required an explanation, and it was shortly afterwards prohibited by the high-commission court. The nation in general was displeased with the rigour of the king's administration; with the plan, which he had not yet abandoned, of a marriage between his son and the Infanta of Spain; and with the favouritism which he manifested, especially towards Villiers,

¹ Aiken's *Court of James*.

whose connections called on him for bountiful provisions, which the king, at his request, with gross facility conceded.

In 1620 the circumstances of his son-in-law, the elector palatine, began to occupy the particular attention of the king. That prince, after having been chosen king by the Bohemians, who had thrown off the Austrian sway and received support from various states of Germany, was at last in a very perilous condition, and on the 8th November, 1620, defeated at the battle of Prague. After much delay, in which he carried on a diplomatic interference, James at last agreed to send a supply of chosen men. But he soon resigned this active interference in his behalf; he called in vain for a benevolence from his wealthy subjects to enable him, as he said, to give him a vigorous support in the event of future urgency; and, finally, summoned a parliament, which had not met for many years, to deliberate on the subject. It met in January, 1621—a parliament memorable for the investigation it made into the conduct of Lord Bacon, and the sentence it pronounced on that distinguished man, who had published only a short time before the second part of his immortal *Novum Organum*. The king, however, had previously promised him either freedom from such a sentence, or pardon after it, and Bacon accordingly was soon released from imprisonment, and, in three years after, fully pardoned by the king. This parliament also granted supplies to James, but in the same year refused farther supplies to the cause of the palatine. James adjourned it in spite of the remonstrance of the House of Commons; and on the same day occurred a well-known conversation of the king and the Bishops Neale and Andrews: "My lords," said the king, "cannot I take my subjects' money when I want it, without all this formality in parliament?" "God forbid, sir," said Neale; "but you should—you are the breath of our nostrils." "Well, my lord," rejoined his majesty to Andrews, "and what say you?" He excused himself on the ground of ignorance in parliamentary matters. "No put-off, my lord," said James, "answer me presently." "Then, sir," said the excellent prelate, "I think it lawful for you to take my brother Neale's money, for he offers it." The king, however, had himself recommended to this parliament the investigation of abuses, and especially inveighed against corruption and bribery in courts of law. In this year he conferred the seals, which Bacon had resigned, upon Williams, afterwards Bishop of Lincoln, who induced him to deliver the Earl of Northumberland from imprisonment; and soon after he very creditably interfered for the continuance of Archbishop Abbot in his office, after he had involuntarily committed an act of homicide.

Parliament meeting again in February, 1622, the commons prepared a remonstrance to the king on the dissatisfaction which was generally felt with the position of affairs both at home and abroad, and calling on him to resist the measures of the King of Spain—to enforce the laws against Popery—marry his son to a Protestant—support Protestantism abroad, and give his sanction to the bills which they should pass with a view to the interest of the nation. On hearing of this proceeding the king addressed an intemperate letter to the speaker, asserting, as usual, the interest of his "prerogative-royal." It was answered by the commons in a manly and loyal address, to which the king replied in a letter still more intemperate than the former. The commons, notwithstanding, drew up and recorded a protest, claiming the right of delivering their sentiments, and of deciding freely, without exposure to impeachment from their speeches in parliamentary debate, and

proposing that, should there be objection made to anything said by a member in the house, it should be officially reported to the king before he should receive as true any private statement on the subject. This protest the king tore out of the journal of the house, ordered the deed to be registered, and imprisoned several of the individuals concerned, who, however, were soon afterwards liberated. But James still maintained his own authority; he strictly prohibited the general discussion of political subjects, and enjoined on the clergy a variety of rules, guarding them against preaching on several subjects, some of which must be regarded as important parts of the system which it is the duty of the clergy to proclaim.

On the 17th of February, 1623, Prince Charles and the Marquis of Buckingham set off on a visit to Spain, with a view to the marriage of the former with the infanta, although the king had resisted the proposal of this journey, which had been urgently made by the prince and Buckingham. On the circumstance being known in England, the favourite was loudly blamed, and the prince suspected of an attachment to Popery. The travellers proceeded in disguise, visited Paris for a single day, and reached Madrid on the 6th of March. The Earl of Bristol, the English ambassador, met them with surprise. James corresponded with them in a very characteristic manner, and sent a large supply of jewels and other ornaments, as a present for the infanta. The Spaniards were generally anxious for the consummation of the marriage. But the pope, unwilling to grant a dispensation, addressed to Charles a letter entreating him to embrace the Roman Catholic religion, to which the prince replied in terms expressive of respect for the Romish church.

Accordingly, all was prepared for the marriage, which was appointed to take place on the 29th of August. But before the day arrived Pope Gregory had died—a circumstance which destroyed the force of the matrimonial articles; and the prince left Spain in the midst of general demonstrations of attachment to his person, and inclination towards the intended marriage. On his way to England, however, he discovered a coldness towards the measure, and shortly after his arrival, in October, the king acceding to the proposal of the favourite, who was displeased at his reception in Spain, a letter was sent to the Earl of Bristol ordering him not to grant the proxy which was required according to the treaty, after the Papal dispensation was obtained, before security should be given by Spain for the restoration of the palatine. But even after the King of Spain had agreed to this proposal, James, persuaded by the favourite, expressed a wish that the matter should be broken off. But the low state of pecuniary resources into which these negotiations had reduced the English king induced him to call a parliament, in February, 1624, to submit to them the matters about which he was now particularly interested. It offered supplies to the king for a war with Spain. War was declared, and the favourite of the king became the favourite of a large proportion of the nation. About the same time an accusation of Buckingham for his conduct in regard to Spain and Bohemia was presented secretly to the king by the Marquis Inojoso. It threw his majesty into excessive agitation; and on setting out for Windsor he repulsed the duke as he offered to enter the royal carriage. The duke inquired, with tears, in what respect he had transgressed, but received only tears and reproaches in return. On receiving an answer by Williams to the charges against the duke, he again received him into favour, and soon after broke off all friendly negotiations with Spain. He resisted, however, though not success-

fully, the proposal of Buckingham and Charles, that he should impeach the lord-treasurer on the ground of corruption in office. He also resisted, with much better reason, the petition of Buckingham that the Earl of Bristol should be forced to submit, exclaiming, "I were to be accounted a tyrant to engage an innocent man to confess faults of which he was not guilty." The earl, however, was prevented from appearing in the presence of the king, who also cautioned the parliament against seeking out grievances to remedy, although they might apply a cure to obviously existing ones.

June, 1624, was occupied by the king and Buckingham in carrying on measures for a marriage between Prince Charles and Henrietta Maria, sister of Louis XIII., and daughter of Henry IV.; and on the 10th of November a dispensation having been with some difficulty obtained from the pope, the nuptial articles were signed at Paris. But in the spring of 1625, the king, whose constitution had previously suffered severely, was seized with ague, of which he died at Theobald's on the 27th of March, in the fifty-ninth year of his age. He was buried in Westminster Abbey, and the funeral sermon was preached by Williams.

On the character of James, so palpable and generally known, it is not necessary to offer many observations. Much of his conduct is to be attributed in a great measure to his political advisers, who were often neither wise nor faithful. His own character embraced many combinations of what may be almost denominated inconsistencies. He was peculiarly subject to the influence of favourites, and yet exceedingly disposed to interfere with the course of political affairs. Indeed, to his warm and exclusive attachments, combined with his extravagant ideas of his own office and authority, may be traced the principal errors of his reign. He was accordingly resolute, and yet often too ready to comply; sensible to feeling, and yet addicted to severity; undignified in manner, and yet tyrannical in government. Erring as was his judgment, his learning cannot be denied, though the use he often made of it, and especially the modes in which he showed it in the course of conversation, have been with reason the subjects of amusement or scorn. His superstition was great, but perhaps not excessive for the age in which he lived; and it is said that in his latter days he put no faith in witchcraft. His religion was probably in some degree sincere, though neither settled nor commanding. Neither his writings nor his political courses, it is to be feared, have done much directly to advance the interests of liberal and prudent policy; but in both there are pleasing specimens of wisdom, and both may teach us a useful lesson by furnishing a melancholy view of the nature and tendency of tyranny, even when in some degree controlled by the checks of parliamentary influence and popular opinion.

JAMESONE, GEORGE, the first eminent painter produced by Britain, was born at Aberdeen towards the end of the sixteenth century. The year 1586 has been given as the precise era of his birth, but this we can disprove by an extract which has been furnished to us from the burgh records of his native town, and which shows that the eldest child of his parents (a daughter) was born at such a period of this year as rendered it impossible that he could have been born within some months of it.¹ It is alone certain that

the date of the painter's birth was posterior to 1586. Of the private life of this distinguished man few particulars are known, and of these few a portion rest on rather doubtful authority. Previously to his appearance no man had so far succeeded in attracting the national attention of Scotland to productions in painting as to render an artist a person whose appearance in the country was to be greatly marked. At that period of our history, too, men had other matters to occupy their minds; and it may well be believed, that, in passing through the fiery ordeal of the times, many men who in peace and prosperity might have had their minds attracted to the ornamental arts, were absorbed in feelings of a very different order, which hardly allowed them an opportunity of knowing, far less of indulging, in the elegant occupations of peace. The father of Jamesone was Andrew Jamesone, burgess of guild of Aberdeen, and his mother was Marjory Anderson, daughter of David Anderson, one of the magistrates of that city. What should have prompted the parents of the young painter to adopt the very unusual measure of sending their son to a quiet fireside in Aberdeen to study under Peter Paul Rubens in Antwerp must remain a mystery. The father is said to have been an architect, and it is probable that he had knowledge enough of art to remark the rising genius of his child, and was liberal enough to perceive the height to which the best foreign education might raise the possessor of that genius. If a certain Flemish building projecting into one of the narrow streets of Aberdeen, and known by the name of "Jamesone's house," be the production of the architectural talents of the elder Jamesone, as the period of the style may render not unlikely, he must have been a man of taste and judgment. Under Rubens Jamesone had for his fellow-scholar Sir Anthony Vandyke, and the early intercourse of these two artists had the effect of making the portraits of each be mistaken for those of the other. In 1620 Jamesone returned to Aberdeen, and established himself as a portrait-painter. He there, on the 12th of November, 1624, married Miss Isobel Tosh—a lady with whom he seems to have enjoyed much matrimonial felicity, and who, if we may judge by her husband's representation of her in one of his best pictures,² must have been a person of very considerable attractions; he had by her several children, of whom the sons seem to have all met early deaths, a daughter being the only child he left behind him.³

Soon after the above entry, there occurs one regarding the baptism of their eldest child, the sister of the painter, in these terms:

"The penult day July, 1586. Ando. Jamesone, Marjore Andone, dochtar in marage, callit Elspett; James Robertson, Edward Donaldson, Elspatt Cuttes, Elspatt Mydilton, witnesses."

¹ The marriage is thus entered in the burgh records: "12th November, 1624, George Jamesone, Isobell Tosche."

² This picture represents the painter himself, and his wife and daughter. The grouping is very neat, and the attitudes of the hands as free from stiffness as those of almost any picture of the age. The daughter is a fine round-cheeked spirited-looking girl, apparently about twelve years old. Walpole says this picture was painted in 1623. From the date of Jamesone's marriage, this must be a mistake. This picture was engraved by Alexander Jamesone, a descendant of the painter, in 1728, and a very neat line engraving of it is to be found in Dallaway's edition of Walpole's *Anecdotes*.

³ The following entry in the council records of Aberdeen relates to the birth of one of Jamesone's children: "1629 yieris—George Jamesone and——Toche, an sone, baptized be Mr. Robert Baron the 27th day of July, callit William; Mr. Patrick Done, Robert Alexander, Andrew Meldrum, William Gordone, god-fathers." The next notice of him which we find in the same authority shows, that on the 2d January, 1630, he was present at the baptism of a child of "James Toshe," probably a relation of his wife, at which, it may be mentioned, William Forbes, Bishop of Edinburgh, officiated. In October of the same year we find him again demanding a similar duty for his own family: "October, 1630 yieres, George

¹ The marriage of the parents of Jamesone is thus entered in these burgh records:

"Thair is promess of marriage betwix
Ando Jamesone } in 17th August, 1585."
Marjore Anderson }

THE NATIONAL ANTHROPOLOGICAL ARCHIVES, SMITHSONIAN INSTITUTION, WASHINGTON, D.C.

A curious evidence of the locality of Jamesone's residence in Aberdeen is to be found in an epigram on that city by the painter's intimate friend Arthur Johnstone, author of the Latin version of the Psalms. It is interesting, as proving that Jamesone possessed what was then seldom to be found in Scotland, a habitation, which added to the mere protection from the inclemency of the seasons, some attempt to acquire the additions of comfort and taste. The epigram proceeds thus:—

"Hanc quoque Lanaris mons oriat, amoenior illis,
Hinc ferrugineis Spada colorat aquis;
Inde suburbanum Jamesoni despicis hortum
Quem domini pictum suspicior esse manu."

In *A Succinct Survey of the Famous City of Aberdeen, by Philopoliteius*, the passage is thus "done" into what the author is pleased to term "English:—

"The Woolman hill, which all the rest outvies
In pleasantness, this city beautifies;
There is the well of Spa, that healthful font,
Whose yrne-hewed water coloureth the mount:
Not far from thence a garden's to be seen
Which unto Jamesone did appertain:
Wherein a little pleasant house doth stand,
Painted as I guess with its master's hand."¹

Jamesone appears to have been in Edinburgh during the visit of King Charles I. in the year 1633. To gratify the taste of that prince he was employed by the magistrates to paint portraits, as nearly resembling probable likenesses as he could devise, of some of the real or supposed early kings of Scotland. These productions had the good fortune to give satisfaction, and the unhappy king, who had soon far different matters to occupy his attention, sat for his portrait, and rewarded the artist with a diamond ring from his own finger. It is alleged that the painter was on this occasion indulged with a permission to remain covered in the presence of majesty—a circumstance which is made to account for his having always represented himself (and he was not spar-

ing in portraits of himself) with his hat on: neither is the permission characteristic of the monarch, nor its adoption by the artist; and the peculiarity may be better attributed to a slavish imitation of his master Rubens in a practice which had been sanctioned by the choice of Carracci and Guido.

It is probable that the patronage and notice of the monarch were the circumstances which introduced the paintings of Jamesone to the notice of the nobility. He appears, soon after the period we have alluded to, to have commenced a laborious course of portrait-painting, then, as now, the most lucrative branch of the art; and the many portraits of their ancestors, still in possession of families dispersed through various parts of Scotland, attest the extent of his industry. The Campbells of Glenorchy, then an opulent and powerful family, distinguished themselves by their patronage of Jamesone. What countenance he may have obtained from other quarters we do not know, and the almost utter silence regarding so great a man on the part of contemporaries makes a document which Walpole has rescued from oblivion, relative to his labours for the family of Glenorchy, highly interesting. From a MS. on vellum, containing the genealogy of the house of Glenorchy, begun in 1598, are taken the following extracts, written in 1635, page 52:—"Item, the said Sir Coline Campbell (eighth laird of Glenorchy), gave unto George Jamesone, painter in Edinburgh, for King Robert and King David Bruysse, Kings of Scotland, and Charles I., King of Great Brittain, France, and Ireland, and his majesties quein, and for nine more of the queins of Scotland, their portraits, quihills are set up in the hall of Balloch (now Taymouth), the sum of twa hundreth thrie scor pounds."—"Mair the said Sir Coline gave to the said George Jamesone for the knight of Lochow's lady, and the first Countess of Argyle, and six of the lads of Glenurquhay, their portraits, and the said Sir Coline his own portrait, quihills are set up in the chalmier of deas of Balloch, an hundreth four scoire punds."² There is a further memorandum, intimating that in 1635 Jamesone painted the family tree of the house of Glenorchy, eight feet long by five broad. What may have become of the portraits of Robert and David Bruce, and of the nine queens, which must have taxed the inventive talents of the artist, we do not know. Their loss may be, however, of little consequence, as we can easily argue from the general effect of Jamesone's productions, that his talent consisted in giving life and expression to the features before him, and not in design. The other paintings have, however, been carefully preserved by the family into whose hands they fell. They consist of portraits of Sir Duncan Campbell, the Earl of Airth, John Earl of Rothes, James Marquis of Hamilton, Archibald Lord Napier, William Earl of Marischal, Chancellor Loudoun, Lord Binning, the Earl of Mar, Sir Robert Campbell, Sir John Campbell, and the genealogical tree mentioned in the memorandum. All these are, we believe, still to be seen in good preservation in Taymouth Castle, where in 1769 they were visited by Pennant, who thus describes the genealogical tree: "That singular performance of his, the genealogical picture, is in good preservation. The chief of the Argyle family is placed recumbent at the foot of a tree, with a branch; on the right is a single head of his eldest son, Sir Duncan Campbell, laird of Lochow; but on the various ramifications are the names of his descendants, and along the body of the tree are nine small heads, in oval frames, with the names on the

Jamesone, and Isobell Toshe, ane sone, baptized the 27th day, callit Paul; Mr. Menzies of Kinnundie, provost, Mr. Alexander Jaffray, bailzie, Mr. David Wedderburne, Mr. Robert Patrie, Patrick Jack, Patrick Fergusson, Andrew Strachan, godfathers." This is a curious evidence of Jamesone's respectability as a citizen. Paul, afterwards Sir Paul Menzies, a man of considerable note in Aberdeenshire, and provost of the city, appears to have been name-father, and Alexander Jaffrey, another of the sponsors, was himself afterwards provost. The extractor of these entries remarks, that the chief magistrate appears to have acted as sponsor only at the baptisms of the children of very influential citizens.

¹ With farther reference to this piece of pleasure-ground, and an anxiety to collect every scrap of matter which concerns Jamesone, we give the following entry regarding a petition, of date the 15th of January, 1645, given in to the town-council of Aberdeen by "Mr. John Alexander, advocate in Edinburgh, makand mention that where that piece of ground callit the play-field besyd y^e Wolman-hill (quihilk was set to unquhill George Jamesone, painter, burges of Edinburgh in liferent, and buildet be him in a garden) is now unprofitable, and that the said John Alexander, sone in law to the said unquhill George Jamesone, is desirous to have the same peice of ground set to him in few heritable to be houlden of the provost, bailzies, and of the burghie of Aberdene, for payment of a reasonable few dutie yeirle theifor;" praying the magistrates to set to him in feu tack the foresaid piece of ground: the request is granted by the magistrates, and farther official mention is made of the transaction of date the 10th November, 1645, where the "marches" of the garden are set forth in full. This piece of ground was the ancient "Playfield" of the burgh, which remained disused after the Reformation had terminated the pageants and mysteries there performed. Persons connected with Aberdeen will know the spot when they are informed, that it is the piece of flat ground extending from the well of Spa to Jack's Brae, bounded on the east by the Woolman-hill, and the burn running at its foot; on the south by the Denburn and the ridge of ground on which Skene Street now stands; on the west by Jack's Brae; and on the north by the declivity occupied by the Gilcomston brewery. The appropriation of the spot to the garden of the painter is still noted by the name of a fountain, called "The Garden Neuk Well."—*Council Record of Aberdeen*, liii. p. 37, 98.

² Walpole's *Anecdotes of Painting*, i. 24.

margins, all done with great neatness: the second son was first of the house of Breadalbane, which branched from the other above four hundred years ago. In a corner is inscribed 'The Genealogie of the House of Glenorquhie, quhairof is descendit sundrie nobil and worthie houses. *Jameson faciebat, 1635.*'¹ After a life which must have been spent in great industry, and enjoying independence, and even wealth, Jamesone died at Edinburgh in 1644, and was buried without a monument in the Grayfriars' Church there.

Walpole, who obtained his information from a relation of the painter, says, "By his will, written with his own hand in July, 1641, and breathing a spirit of much piety and benevolence, he provides kindly for his wife and children, and leaves many legacies to his relations and friends, particularly to Lord Rothes the king's picture from head to foot, and Mary with Martha in one piece: to William Murray he gives the medals in his coffer; makes a handsome provision for his natural daughter; and bestows liberally on the poor. That he should be in a condition to do all this seems extraordinary, his prices having been so moderate; for, enumerating the debts due to him, he charges Lady Haddington for a whole length of her husband, and Lady Seton, of the same dimensions, frames and all, but 300 merks: and Lord Maxwell for his own picture and his lady's to their knees, 100 merks, both sums of Scots-money."² The average remuneration which Jamesone received for his portraits is calculated at twenty pounds Scots, or one pound thirteen shillings and four pence sterling. People have wondered at the extreme smallness of the sum paid to so great an artist; but, measured by its true standard, the price of necessary provisions, it was in reality pretty considerable, and may easily be supposed to have enabled an industrious man to amass a comfortable fortune. Walpole continues, "Mr. Jamesone (the relation from whom the facts of the account were received) has likewise a memorandum written and signed by this painter, mentioning a MS. in his possession, 'containing 200 leaves of parchment of excellent write, adorned with diverse histories of our Saviour curiously limned,' which he values at £200 sterling, a very large sum at that time! What is become of that curious book is not known." It is probable that the term "sterling" affixed to the sum is a mistake. It was seldom if ever used in Scotland at the period when Jamesone lived. We are not given to understand that the "limning" was of the painter's own work, and we are not to presume he was in possession of a volume superior in value to the produce of many years' labour in his profession. The manuscript, though mentioned with an estimation so disproportionate to that of the works of its proprietor, was probably some worthless volume of monkish illuminations, of which it would waste time to trace the ownership. The description might apply to a manuscript "Mirror of the Life of Christ," extant in the Advocates' Library.

We have already mentioned a considerable number of the portraits by Jamesone as extant in Taymouth Castle. An almost equal number is in the possession of the Alva family; and others are dispersed in smaller numbers. Carnegie of Southesk possesses portraits of some of his ancestors, by Jamesone, who was connected with the family. Mr. Carnegie, town-clerk of Aberdeen, possesses several of his pictures in very good preservation, and among them is the original of the portrait of the artist himself which has been engraved for this work. An-

other individual in Aberdeen possesses a highly curious portrait by Jamesone of the artist's uncle, David Anderson of Finzeach, merchant-burgess of Aberdeen, an eccentric character, the variety of whose occupations and studies procured him the epithet of "Davie do a' thing." Some of Jamesone's portraits hang in the hall of Marischal College in a state of wretched preservation. Sir Paul Menzies, provost of Aberdeen, presents us with a striking cast of countenance boldly executed; but in general these are among the inferior productions of Jamesone. They are on board, the material on which he painted his earlier productions (and which he afterwards changed for fine canvas), and are remarkable for the stiffness of the hands, and the awkward arrangement of the dress; two defects which, especially in the case of the former, he afterwards overcame. There is in the same room a portrait of Charles I. of some merit, which the exhibitor of the curiosities in the university generally attributes to Vandyke. It is probably the work of Jamesone, but it may be observed, that there is more calm dignity in the attitude, and much less expression, than that artist generally exhibits. Walpole and others mention as extant in the King's College of Aberdeen, a picture called the "Sibyls," partly executed by Jamesone, and copied from living beauties in Aberdeen: if this curious production still exists in the same situation, we are unaware of its being generally exhibited to strangers. There is a picture in King's College attributed to Jamesone, which we would fain bestow on some less celebrated hand. It is a view of King's College as originally erected, the same from which the engraving prefixed to Orem's account of the cathedral church of Old Aberdeen is copied. It represents an aspect much the same as that which Slezer has given in his *Theatrum Scotiæ*, and, like the works of that artist, who could exhibit both sides of a building at once, it sets all perspective at defiance, and most unreasonably contorts the human figure. In characterizing the manner of Jamesone, Walpole observes that "his excellence is said to consist in delicacy and softness, with a clear and beautiful colouring; his shades not charged, but helped by varnish, with little appearance of the pencil." This account is by one who has not seen any of the artist's paintings, and is very unsatisfactory.

It is indeed not without reason that the portraits of Jamesone have frequently been mistaken for those of Vandyke. Both excelled in painting the human countenance—in making the flesh and blood project from the surface of the canvas, and animating it with a soul within. That the Scottish artist may have derived advantage from his association with the more eminent foreigner it were absurd to deny; but as they were fellow-students, candour will admit that the advantage may have been at least partly repaid, and that the noble style in which both excelled may have been formed by the common labour of both. It can scarcely be said that on any occasion Jamesone rises to the high dignity of mental expression represented by Vandyke, nor does he exhibit an equal grace in the adjustment of a breast-plate or the hanging of a mantle. His pictures generally represent hard and characteristic features, seldom with much physical grace, and representing minds within, which have more of the fierce or austere than of the lofty or elegant; and in such a spirit has he presented before us the almost breathing forms of those turbulent and austere men connected with the dark troubles of the times. The face thus represented seems generally to have commanded the whole mind of the artist. The back-ground presents nothing to attract attention, and the outlines of the hard features gene-

¹ *Tour*, 1769, p. 87.

² *Anecdotes*, i. 250.

rally start from a ground of dingy dark brown, or deep gray. The dress, frequently of a sombre hue, often fades away into the back-ground, and the attitude, though frequently easy, is seldom studied to impose. The features alone, with their knotty brows, deep expressive eyes, and the shadow of the nose falling on the lip—a very picturesque arrangement followed by Vandyke—alone demand the attention of the spectator. Yet he could sometimes represent a majestic form and attitude, as the well-known picture of Sir Thomas Hope testifies. We shall notice one more picture by Jamesone, as it is probably one of the latest which came from his brush, and exhibits peculiarities of style not to be met with in others. This portrait is in the possession of Mr. Skene of Rubislaw, and represents his ancestor Sir George Skene of Fintray, who was born in 1619. The portrait is of a young man past twenty; and it will be remarked, that the subject was only twenty-five years of age when the artist died. The picture is authenticated from the circumstance of a letter being extant from the laird of Skene to Sir George Skene, requesting a copy of his portrait “by Jamesone,” and in accordance with a fulfilment of this request, a copy of the portrait we allude to is in the family collection at Skene. Jamesone has here indulged in more fulness and brilliancy of colouring than is his general custom: the young man has a calm aspect; his head is covered with one of the monstrous wigs then just introduced; he is in a painter’s attitude, even to the hand, which is beautifully drawn, and far more graceful than those of Jamesone generally are. On the whole, this portrait has more of the characteristics of Sir Peter Lely than of Vandyke.

Jamesone has been termed the “Vandyke of Scotland,” but he may with equal right claim the title of the Vandyke of Britain. Towards the latter end of Elizabeth’s reign Hilliard and Oliver had become somewhat distinguished as painters in miniature, and they commanded some respect, more from the inferiority of others, than from their own excellence; but the first inhabitant of Great Britain, the works of whose brush could stand comparison with foreign painters, was Jamesone.

A Latin elegy was addressed to the memory of Jamesone by David Wedderburn; and his friend and fellow-townsmen Arthur Johnston (whose portrait had been painted by Jamesone) has left, in one of his numerous epigrams, a beautiful poetical tribute to his memory. After his death the art he had done so much to support languished in Scotland. His daughter, who may have inherited some portion of plastic genius, has left behind fruits of her industry in a huge mass of tapestry which still dangles from the gallery of the church of St. Nicholas in Aberdeen. This lady’s second husband was Gregory the mathematician. A descendant of the same name as the painter has already been alluded to as an engraver in the earlier part of the eighteenth century, and John Alexander, another descendant, who returned from his studies in Italy in 1720, acquired celebrity as an inventor of portraits of Queen Mary.

JAMESON, ROBERT, regius professor of natural history in the university of Edinburgh, and keeper of the university museum, &c.—This eminent naturalist, who has frequently been called the father of modern natural history, was third son of Thomas Jameson, soap manufacturer, Leith, and was born there in July, 1772. After the usual preliminary education he was set to the study of medicine, with a view to following the profession of the healing art; but his predilections for natural history were so strong and early as to

decide the course of his future life. Even while a boy at the grammar-school of Leith, he was more intent in stuffing birds, and collecting animals and plants on the beach, than in conjugating Latin verbs, and studying the measures of verses. As these pursuits grew upon him until he became a confirmed naturalist, his study of medicine in its various departments aided his researches, and was wisely adopted as their handmaid. It was by this science that his investigations were reduced to form and order, and that he was enabled duly to appreciate the physiological as well as the systematic elements of natural history. What remarkable proficiency he had made in geology was attested by his *Outlines of the Mineralogy of the Shetland Islands and of the Island of Arran, with an Appendix containing Observations on Peat, Kelp, and Coal*—a work which he produced in his twenty-fifth year. Two years afterwards (1800) he published his *Outlines of the Mineralogy of the Scottish Isles*.

These early achievements in his favourite science, distinguished though they were, did not satisfy the aspirations of Jameson, and what would have sufficed a less craving appetite for knowledge, in him only whetted it into renewed vigour. Having mastered all that the schools of our island could teach, and visited London in 1793, where he enjoyed personal intercourse with Sir Joseph Banks, Dr. Shaw, and other chief members of the Linnean Society, he resolved to apply to the continental schools; he accordingly passed over to Germany, and at Freyburg in Saxony became the disciple of the celebrated Werner, whose theories he adopted, and of which he became for some time one of their most enthusiastic propagators and expounders. After a stay of nearly two years in Saxony, during which, for the purpose of improving his knowledge in geology and mineralogy, he not only attended the lectures of Werner, but wrought in the mines like a common workman, he returned to Scotland in 1804. He would have again visited Germany, had it not been for an important event which occurred in the same year. This was his appointment to the chair of natural philosophy in the university of Edinburgh, in consequence of the death of Dr. Walker, who had previously held that charge, and of whom Professor Jameson had been the favourite pupil. This appointment, Dr. Fleming, his highly distinguished friend, informs us, “raised great expectations and were speedily realized. The notions of the Huttonians at this period respecting the laws of superposition of the strata were very defective, scarcely amounting to perceivable glimmerings. But Professor Jameson, intimately acquainted with the geognosy of Werner, speedily began to group the rocks of the neighbourhood into their distinct formations, and to assign the relative position of our transition rocks, old red sandstone, and the independent coal formation. This important step in the progress of our geology was followed by a system of prelections, accompanied by excursions to the more important localities where the phenomena could be studied in the field, and produced a number of zealous observers, who have not only extended our knowledge of the structure and contents of this locality, but of the United Kingdom and its dependencies.” While his lessons a-field were thus zealously prosecuted, Professor Jameson’s course of lecturing in the class-room was not less distinguished by devotedness to natural science, and it embraced general views and particular details in meteorology, hydrology, mineralogy, geology, botany, and zoology.

In the same year that Mr. Jameson was appointed to the professorship, he published part 1 in 8vo,

with maps and plates, of his *Mineralogical Description of Scotland*. This he intended to be only the beginning of a series that should have comprised geological accounts of all the counties of Scotland. But from this highly useful purpose he was prevented by the cares of attending to the university museum, the publication of a *System of Mineralogy*, and a volume on the *Characters of Minerals*. In 1808 he founded at Edinburgh the Wernerian Natural History Society. Hitherto the Huttonian doctrines had prevailed, while those of the Wernerian school were comparatively unknown, until in 1809 Professor Jameson published his *Elements of Geognosy*, by which Wernerianism was promulgated, and converts made to its theory among the scientific inquirers both in Scotland and England. The establishment of such a society, which was regarded as an intrusion, and its doctrines, which were opposed as downright heresies, roused the indignation of the Huttonians, who had hitherto held possession of the field, and under the distinctive titles of Plutonists and Neptunians, or Huttonists and Wernerians, the rival parties commenced a war against each other which was carried on with almost theological intensity. The strife indeed has passed away, and even the combatants are asking each other why they fought so fiercely; but some such commotion was needed to quicken the researches of the scientific, and drive them into practical research instead of theory and hypothesis, while science itself has been amplified and improved by the interest which the battle had kindled. Of the Wernerian Society which he founded in Edinburgh, Professor Jameson was elected perpetual president, and to the seven volumes of its *Transactions* which have been published he was a frequent contributor.

The Travels of Baron Leopold Von Buch through Norway and Lapland during the years 1806-7-8 having been published in one volume quarto, Professor Jameson was so thoroughly impressed by the scientific merits of the work, that he suggested a translation of it for the press; and this being done, he enriched the English version with an account of its author the distinguished traveller and geologist, and several notes illustrative of the natural history of Norway. It was the professor's intention that this should form one of a series of translations, chiefly from the German, of the travels of scientific men, who, like Von Buch, had described the appearance and geological structure of the countries they visited, as well as given an attractive account of their animal and vegetable productions, and the manners and customs of their inhabitants.

In 1816 another edition of his *System of Mineralogy* appeared in three volumes, and during its day was the most complete work on the subject. About the same period a new edition of his *Characters of Minerals* was published, and only two years afterwards (1820), so great was the demand for these works, that fresh editions of both were prepared and issued from the press. In 1821 he published a *Manual of Minerals and Mountain Rocks*. This was reckoned by scientific judges the best text-book of its time, and so great was the demand for it that 1500 copies were sold in the course of a few months.

A still more strenuous task for the improvement and diffusion of scientific knowledge was undertaken by Professor Jameson. He had planned in conjunction with Dr. (afterwards Sir David) Brewster the *Edinburgh Philosophical Journal*, and in 1819 the publication of the series commenced, which at Jameson's death, had extended to seventy volumes. For the first six years he edited the work in conjunction with Sir David, but afterwards was sole editor until the close of his life. Speaking of this work in 1854,

the biographer of Jameson adds, "It is, we believe, admitted to be the most valuable repository of scientific information in Britain for the period of its existence. The earlier volumes contain not a few contributions from himself; and besides numerous original articles from other hands, the journal comprehends translations of memoirs from the French, German, Italian, and Swedish languages, with many communications from foreign correspondents on all the branches of natural history. It will form one of the most durable monuments of his talents and industry." Our ideas of his industry and enthusiastic zeal for science are enhanced by our knowledge of the fact, that during this busy life of authorship, he was diligently performing the duties of his professorial office, and giving two courses of lectures annually, the one in summer and the other in winter.

Although we have mentioned the principal writings of Professor Jameson, there were many others with which he was connected, editorially or otherwise, which were enlarged or illustrated by his pen. This was especially the case with Cuvier's celebrated *Discourse on the Theory of the Earth*, which was translated into English and published by Mr. Kerr in 1813—a translation which ran through five editions, and made Cuvier familiar to the British public, who until now had known little of this eminent scientific Frenchman. This translation Jameson entirely remodelled in the fifth edition, and so entirely, that it was extended from 190 to 550 pages. "The notes I have added," he modestly says in the preface, "will, I trust, be found interesting; and the account of Cuvier's geological discoveries, which accompanies them, will be useful to those who have not an opportunity of consulting the great work." Another demand was made upon Jameson by Captain Parry, on the return of the latter from his Polar expedition; and the professor on this occasion drew up, from the specimens brought home, a sketch of the geology of the different coasts discovered and touched upon, which was published in Parry's narrative of the voyage. Besides this, he drew up for the *Cabinet Library* an account of the geology of those Arctic regions which Captain Parry had visited. He wrote excellent articles on the physical geography of Africa and India, which were published in the *Edinburgh Cabinet Library*. He also revised and arranged in a scientific manner a new edition which was published of Wilson's *American Ornithology* in four volumes, making it suitable for a text-book in our universities and schools. Among the detached articles which he wrote at different periods for the Scottish encyclopædias, may be mentioned those entitled "Adelfors," "Ailsa," "Alabaster," "Altai," "Allegban Mountains," "Amber," "Ambergis," "Ammoniac," "Ammonites," "Amphibia," "Amphibious," "Arran," "Diamond," "Hartz," and "Mineralogy," which appeared in the *Edinburgh Encyclopædia*—and the articles "Mineralogy," "Geology," and "Organic Remains," which were published in the *Encyclopædia Britannica*, when edited by Macvey Napier. Reverting again from his works in authorship, to the effects of his teaching, the pupils of Jameson were such as few professors could boast of. Of these his biographer has enumerated nineteen who rose to the highest eminence in the sciences which he taught, and of each of whom he might say, as Ulysses does of Achilles—

"Injecique manum, fortemque ad fortia misi:
Ergo opera illius, mea sunt."

The following testimony to his teaching and its effects, was given by Professor Edward Forbes, his scholar, and afterwards his distinguished successor:—

"The value of professional worth should chiefly be estimated by the number and excellence of disciples. A large share of the best naturalists of the day received their first instruction in the science that was afterwards to prove their fountain of honour, from Professor Jameson. Not even his own famous master, the eloquent and illustrious Werner, could equal him in this genesis of investigators. Under his auspices, too, were lasting friendships and unions of kindred minds formed, that have been productive in good to the cause of knowledge. Valuable as were his writings—each, when estimated with regard to the position of science at the time of its issue, an effective advance—his pupils were even more valuable. The greatest praise of a great professor is that which proclaims that he has founded a school. And where else in the British empire, except here, has there been for the last half century a school of natural history?"

While Professor Jameson was thus unwearied in publishing and lecturing, another subject of his care was, that there should be a proper collection of specimens, by which the several departments of natural history might be illustrated. But on his appointment to the professorship scarcely the embryo of a museum existed in the university of Edinburgh. The splendid bequest of Sir Andrew Balfour to the college, in 1694, of the extensive collection which he had been forty years in accumulating, and which was supposed at the time to be the finest in Europe, had been so little appreciated and so carelessly kept, that it had mouldered away into a few specimens, which were regarded as unsightly rubbish. Accordingly, when Jameson became professor of natural history, in 1804, the beggarly inventory of this sometime famous collection had dwindled into a few glasses of birds and serpents, a small collection of minerals, and a few dresses and weapons of savage nations. It was such a museum as is sometimes to be found in a cellar, and shown to spectators for the sum of one penny. Even the birds, too, were in such a decayed condition, that Jameson was soon forced to throw them out. Such was the germ out of which he evolved the rich and widely-famed Edinburgh museum, of which he may be justly considered the founder and builder. His first step was to place his own collection of natural history in the museum, and afterwards to collect or procure, as far as his influence went, such additions as were best suited for the purpose, much of the expenditure for which was defrayed from his own pocket. As the cost, however, of such a process soon outgrew his means, he laid the case before government, and obtained an order that £100 should be paid annually to the professor of natural history for the use of the museum. The early increase of the collection through the zeal of the professor necessitated increased accommodation, and on applying to the town-council, a very spacious and handsome museum was fitted up for the reception of the articles of natural history—and when this accommodation also in course of time became too limited, he applied for and obtained that part of the building of the university, then in the course of erection, which was afterwards distinguished by the title of the New Museum. This grant was not more than necessary, for in 1819 the famous Dufresne collection had become the property of the university of Edinburgh by purchase, and at the instigation of Professor Jameson, although the Emperor of Austria and also the Emperor of Russia had offered much larger sums for it. About the same time a good many valuable articles of natural history were purchased by the university at the sale of Mr. Bullock's cabinet—and these,

with the Dufresne collection, and all the previous collections, were safely housed and arranged, in 1820, in their new college buildings. Yet still his own private outlay had been going on, and was continued till the hour of his death. But far more ample resources were needed for such a great national undertaking, and these were obtained, although still most inadequate for the occasion, by admitting the public in 1820 to the museum, at the cost of half-a-crown for each visitor, which was afterwards reduced to a shilling. He also made another appeal to government, and the annual grant of £100 per annum for the benefit of the museum was raised to £200. And yet these would have been only drops in the bucket or sprinkled upon the sand, but for his indomitable energy, as well as his personal sacrifices. What the museum had been in 1804, when he first took possession of it, we have already seen: what it had become under little more than twenty years of his fostering care, he thus stated in his evidence before the royal commission in giving a history of the museum from the year 1804 to 1826:—"Since that time [the removal into the new building], the museum has increased more than at any former period, so that the collection is nearly double what it was in 1820. About a year ago I again stated to the commissioners for college buildings, that further accommodation for objects of natural history was wanted, the cases in the New Museum being completely filled. The commissioners, with their usual liberality and activity, after considering my proposal, ordered a suite of rooms, five in number, to be immediately fitted up. This series of rooms, at the time this report is writing, is nearly filled with beautiful and interesting objects of natural history. The museum is rapidly increasing, and will, ere many years pass, equal in extent and splendour some of the most distinguished museums in other parts of the world."

In concluding this part of his evidence before the royal commission, the professor had stated the necessity of still larger accommodation, and declared that another series of rooms must be provided before these hopes for the museum could be realized. For this he memorialized the crown, the city, and the senatus, and was enabled in conclusion to declare, "The commissioners for college buildings, to whom I have again applied, are now considering the propriety of erecting another museum of natural history, on the ground to the westward of the present museum." But notwithstanding his appeals the subject was allowed to slip aside, and Professor Jameson was left to "find ample room and verge enough" where he best could, or make shift without them. Thus affairs continued until 1852, when the collection had so greatly increased that it could not be exhibited without more liberal accommodation; and this he explained in a statement which was laid before the town-council. Convinced of the fact, the council presented a memorial to government for museum extension, and for converting the present museum into a national museum for Scotland—himself also forwarding a strong memorial to the same effect. And we know how successful these appeals were at last. The national museum was built, and its collection constitutes not only one of the proudest ornaments of our country, but one of the noblest collections of which science can boast. But Jameson, who had done so much for it, and without whom it would probably have never existed, was not permitted to see the rising of the walls, or even the laying of the foundation-stone. After he had reached the age of eighty years, filled his official chair for half a century, and obtained a world-wide

renown, which every year has tended only to deepen and confirm, he passed away in the full brightness of his fame, and left a void which will not soon be filled. His death occurred on the 19th of April, 1854. Although of slender body, his general health was good, and his wiry frame could endure much fatigue without injury; and his first tokens of decay were from repeated and severe attacks of bronchitis during the last two years of his life, under which he finally yielded. His remains were honoured with a public funeral, and interred in the Warriston cemetery. His chief characteristics are thus described by the biographer from whose account we have chiefly drawn up this memoir.

"Robert Jamieson was the father of modern natural history. His loss is deeply to be deplored; a man of the same grasp of mind, devoted to physical science, only at times appears to enlighten his age. He was eminently fitted for the station which he had filled with so much success. He had fine natural talents, which had been carefully cultivated, and were applied with vigour to the studies in which he delighted. He was a careful observer, a comprehensive thinker, and his industry was unwearied. He was never satisfied with loose and general notions upon any subject; his range of information was wide, and what he knew he knew thoroughly. He was practical, and anxious to be useful, in days when science and practice stood apart, as if they were two repellant forces. He did much towards neutralizing these states; and was one of the pioneers to whom we are indebted for that union of science and practice which is now the prevailing feature of our time."

JAMIESON, Rev. JOHN, D.D., F.R.S., F.S.A.—This excellent natural philologist was born in Glasgow, in March, 1759. His father, the Rev. Mr. Jamieson, was one of the early ministers of the Secession, and presided over the Antiburgher congregation of Duke Street, Glasgow. As John was also designed for the ministry, he was sent in early life to the university of his native city, where his philological capacities obtained for him respectable notice as an apt and diligent scholar in Latin and Greek. But this was by no means the field in which he was ultimately destined to excel; and his bent was already indicated, in his love of ancient ruined towers and black-letter books. His vocation evidently was not to master a dead, but to revive a dying language; by far the more glorious achievement of the two. After the usual course of logic, ethics, and physics, he became a student in theology, and his proficiency excited the highest expectations of future success as a minister. At the close of his theological course he was taken on trials as a licentiate by the General Associate presbytery of Glasgow, and licensed as a preacher in 1780. Two congregations were soon desirous to have him for their minister; the one in Dundee, and the other in Forfar. In this question of contending claims, it was for the Associate Synod to decide; and in consequence of their preference to the call from Forfar, Mr. Jamieson was ordained to the pastoral charge in that town by the Secession presbytery of Perth, in 1781.

At the early age of twenty-two Mr. Jamieson thus entered upon the sacred office of a minister. It was at that time one of peculiar difficulty among the Secession body; for the ferment produced in this country by the French revolution, and the political suspicions which it diffused through the whole community, caused all who did not belong to the Established church to be considered as disloyal, or at least discontented, subjects. Mr. Jamieson of course was regarded, at his entrance into Forfar, as one

who might become a teacher of sedition, as well as a preacher of the gospel of peace. But he had not been long there when his conduct disarmed the suspicious, and procured him general confidence and esteem; while his able clerical labours were rewarded with a full congregation and permanent usefulness. He thus made trial of his ministry for sixteen years, during which period he married the daughter of a neighbouring proprietor, who gladdened the course of his long life, and died only a year before his own decease. It was in Forfar also that he commenced his life of authorship, and his first production was of a kind the least to be expected from a plodding, word-sifting antiquary—it was a poem! It was published in 1789, and entitled the "*Sorrows of Slavery*, a Poem, containing a Faithful Statement of Facts respecting the Slave-trade." We suspect that though most of our readers may have read the splendid lyrics of Cowper and Montgomery on the same subject, they have not chanced to light upon this production of Jamieson. He made another attempt of the same nature in 1798, when he published "*Eternity*, a Poem, addressed to Free-thinkers and Philosophical Christians." But during the interval between these two attempts his pen had been employed in more hopeful efforts. These were, an "*Alarm to Britain*; or, an Inquiry into the Causes of the Rapid Progress of Infidelity," which he published in 1795; and a "*Vindication of the Doctrine of Scripture*, and of the Primitive Faith concerning the Divinity of Christ, in reply to Dr. Priestley's *History of Early Opinions*," which appeared in the same year. The last was a work of great scholarship and research, as well as cogent argument; and in these departments, at least, he showed himself a full match for his formidable antagonist. Another work which he published during his ministry in Forfar was of a different bearing, as may be learned from its title, which was *Sermons on the Heart*.

By these labours Jamieson won for himself an honourable name in literature, that was especially grateful to the religious community to which he belonged, and they testified their feeling in a way that was not only creditable to him, but to themselves. A call was sent to him in 1796, from the congregation in Nicolson Street, Edinburgh, whose pastor, the Rev. Mr. Banks, had left them for America. The synod at the time judged his transfer from Forfar to Edinburgh inexpedient, and decided accordingly; but the Nicolson Street congregation thought otherwise, and renewed their call and were successful, so that he was inducted as their minister in June, 1797. Jamieson's clerical duties were thus multiplied by a new and more extensive field of labour; but he did not remit those literary exertions which had thus far been crowned with success. In 1799 he published his *Remarks on Rowland Hill's Journal*. In 1802 appeared his work, in two volumes octavo, entitled the *Use of Sacred History*; and in 1806, the *Important Trial in the Court of Conscience*. His next work, and by far his most important, was the *Etymological Dictionary of the Scottish Language*. The herculean attempt which he proposed to himself in this work, and which he has so successfully accomplished, was the following:—1. To illustrate the words, in their different significations, by examples from ancient and modern writers. 2. To show their affinity to those of other languages, and especially the northern. 3. To explain many terms which, though now obsolete in England, were formerly common to both countries. 4. To elucidate national rites, customs, and institutions, in their analogy to those of other nations.

The history of this national production of Jamieson

is worthy of particular notice. When he first engaged in a task to which his early studies and pursuits had been so congenial, he had meant to produce nothing more than a work of small dimensions—a mere vocabulary or glossary of the Scottish tongue; and in the notes which he had prepared for the occasion, the names of his authorities were merely mentioned, without further reference. It was then suggested to him that the *Dictionary* would be more acceptable to the public, as well as more satisfactory as a standard, if he quoted those passages at full by which his definitions were confirmed. He acted upon this advice, being fully persuaded of its correctness, and the consequence was, that his drudgery was again to be undergone, and that too with many heavy additions, so that he went over the whole ground not only a second, but in many cases a third time. It was not wonderful if, under such a process, the result was two goodly quarto volumes, instead of a slim duodecimo. The new light, also, which broke upon him in the course of his studies, was sufficient to inspire him with tenfold ardour in the task. At the outset he had supposed, in common with the prevalent opinion, that the Scottish language was, in fact, no language at all, but a mere dialect of the Anglo-Saxon; and that, as such, its fountain was at no greater distance than England, and of no higher antiquity than the days of Hengist and Horsa. His interviews, however, with a learned Icelander, suggested another and more important theory: this was, that the primitive words of the Scottish dialect were not Saxon, nor even Celtic, but Gothic. Were the Lowlanders of Scotland, then, the descendants not merely of Anglo-Saxon captives and refugees, but of a still more illustrious race—even of those who conquered Rome herself, and opened the way to the regeneration of Europe? Such, he concluded, *must* be the case; and the only difficulty that remained was to prove it. This he endeavoured to accomplish, by demonstrating that the Picts were not a Celtic but a Gothic race; and that from them, and not the Welsh or the Saxon, we derive these peculiarities of the Scottish tongue. This theory, which he supported with a great amount of learning and probability, is published in his “*Dissertation on the Origin of the Scottish Language*,” prefixed to the *Dictionary*. The *Dictionary* itself was published in 1808-1809, to which a *Supplement*, in two other quarto volumes, was added in 1825. As the first portion of the work was soon out of print, he published an abridgment of it in 1818, in one volume octavo. All this was an immense amount of labour for a single mind, and the literary world was astonished at his long-continued, unshrinking perseverance, as well as the successful termination that required it. But still he never considered it completed, and continued his additions and improvements to the last; so that, at his death, two large volumes in manuscript had accumulated, nearly ready for the press. And besides all this, his antiquarian industry was employed upon other tasks of a kindred nature. In 1811 he published *An Historical Account of the Ancient Culdees of Iona, and of their Settlement in England, Scotland, and Ireland*. In 1814 appeared his “*Hermes Scythicus*,” or the Radical Affinities of the Greek and Latin Languages to the Gothic.” In 1817 he contributed to the *Edinburgh Phil. Trans.* a paper “On the Origin of Cremation, or Burning of the Dead.” In the year following he unexpectedly appeared in a *Grammar of Rhetoric and Polite Literature*. He also edited two important national productions, which, on account of their obsolete language, were fast hastening into general forgetfulness. These were the *Wisdom of Blind Harry*, and the *Brace of Barbour*.

This list of Jamieson's publications, of a strictly scholastic nature, may startle some who recollect that all the while he was minister of an Antiburgher congregation; and that, too, in the heart of Edinburgh. How were his clerical duties fulfilled, and his people satisfied? But while he was delighting the literary world by his valuable productions, and winning the foremost place in Scottish antiquarianism, he was not regardless of theology as his proper sphere. In 1811 he published a sermon entitled *The Beneficent Woman*; in 1818, a sermon on *The Death of the Princess Charlotte*; and in 1819, *Three Sermons concerning Brotherly Love*. His close attention to his pastoral duties had also endeared him to his congregation, while they were proud of the high reputation of their minister, which was thrown with a reflected lustre upon themselves. An event also occurred in their religious body that highly gratified his Christian feelings of brotherly affection and unity, as well as the enlarged and liberal aspirations of his intellectual character. This was the union of the Burgher and Antiburgher divisions of the Secession church, who, after having kept apart until there were no longer grounds for separation, at length agreed to reunite and be at one. This consummation he had long earnestly sought; and besides using every effort to procure it, he preached and published two sermons recommendatory of the union, which was accomplished in 1820. Ten years after this gratifying event, Dr. Jamieson, whose age had now passed the threescore years and ten, and had entered the last decade of the series whose “strength is but labour and sorrow,” resigned his charge of Nicolson Street congregation, and withdrew into private life. And in his old age he was soon alone, for his numerous family of fourteen children had gone successively to the grave before him, many of them when they had reached the season of manhood, and one of them, Robert Jamieson, when he had become one of the most distinguished lawyers in Scotland. Last of all his wife died also, only a year before his own death, and while his final illness was creeping upon him. But it was then, when nothing more remained for him, that he felt the immeasurable superiority of religion, and the comfort which it can impart, when even literary fame, the purest of all earthly consolations, has no longer the power to charm. He died at his house in George Street, Edinburgh, on the 12th of July, 1838, in the eightieth year of his age.

JARDINE, GEORGE, A.M., for many years professor of logic in the university of Glasgow, was born in the year 1742 at Wandal, in the upper ward of Lanarkshire, where his predecessors had resided for nearly two hundred years. The barony of Wandal formerly belonged to the Jardines of Applegirth—a younger son of whom appears to have settled there about the end of the sixteenth century, and to have also been vicar of the parish during the time of Episcopacy. The barony having passed from the Applegirth to the Douglas family, Mr. Jardine's forefathers continued for several generations as tenants in the lands of Wandal, under that new race of landlords. His mother was a daughter of Weir of Birkwood, in the parish of Lesmahagow.

After receiving his elementary education at the parish school, he, in October, 1760, repaired to Glasgow College, and entered as a member of a society, where, with very little interruption, he was destined to spend the whole of his life. After going through the preliminary classes, where his abilities and diligence attracted the attention and acquired for him the friendship of several of the professors, he entered the divinity hall under Dr. Trail, then professor of

theology, and in due time obtained license as a preacher from the presbytery of Linlithgow. He did not, however, follow out the clerical profession, having, from the good wishes of several of the professors of Glasgow College, reason to hope that he might eventually be admitted to a chair, which was the great object of his ambition.

In 1771 he was employed by Baron Mure of Caldwell to accompany his two sons to France, and to superintend their education at an academy in Paris. The baron, who was at that time one of the most influential men in Scotland, and who lived much in the literary circle of Edinburgh, obtained from his friend David Hume letters of introduction to several of the French philosophers of that day; by means of which Mr. Jardine had the advantage of being acquainted with Helvetius and with D'Alembert, who were then in the zenith of their fame, and whose manners he used to describe as presenting a striking contrast—Helvetius having all the style and appearance of a French nobleman of the first fashion, while D'Alembert preserved a primitive simplicity of dress and manner, at that time quite unusual in Paris. During his residence there he lived a good deal in the society of Dr. Gemm, the uncle of Mr. Huskisson, who was then settled as a physician in Paris, and noted not only for his eminence in his profession, but for his talents as a philosopher. Dr. Gemm was an ardent friend to liberty, and at that time did not scruple to anticipate, to those with whom he was intimate, the fall of the French monarchy as an event at no great distance.

Soon after his return from France, in July, 1773, a vacancy occurred in the humanity chair of Glasgow by the death of Mr. Muirhead, for which a very keen competition arose between him and Mr. Richardson, the result of which was doubtful until the very morning of the election, when, notwithstanding, every exertion made in behalf of Mr. Jardine by Lord Frederic Campbell, the lord-rector, Mr. Richardson carried the election by a majority of one vote. Upon this occasion Mr. Clow, the professor of logic, who had always befriended Mr. Jardine, though, from a prior engagement, he on this occasion felt himself obliged to support the other candidate, told him not to be discouraged, for that there might ere long be an opportunity of his being admitted into their society. The expectations which Mr. Clow thus kindly threw out he very soon realized; for, towards the end of the following session, he intimated to the college, that, from his advanced age, he required to be relieved from the labour of teaching, and expressed a wish that Mr. Jardine might be associated with him in the professorship. About this time, too, Dr. Moor, professor of Greek, gave in his resignation; and in June, 1774, upon the same day, the faculty of Glasgow College elected Mr. Young to the Greek chair, and appointed the subject of this memoir assistant and successor to Mr. Clow.

By this arrangement the charge of the three junior classes of Glasgow college came, at the same time, to devolve upon three men in the vigour of life, who all entered most zealously into the business of their respective departments, in which they soon introduced very material improvements:—in particular, they contrived to infuse a spirit of emulation among their pupils by the institution of prizes publicly distributed at the end of each session to those who had distinguished themselves during the course—an institution which was gradually extended to other classes at Glasgow, and which has now been generally introduced into the other universities. These prizes have been increased during recent years by the munificence of several of the lord-rectors and

the generosity of public-spirited individuals. There are prizes bearing the names of James Watt, Lord Jeffrey, Mr. James Ewing, the Marquis of Breadalbane, &c., arising from large sums of money permanently invested for that purpose.

The business of the logic class had hitherto consisted in an explanation of the *Dialectics* of Aristotle, followed up, towards the end of the course, by an exposition of the most abstruse doctrines of metaphysics and ontology, embracing the general attributes of being, existence, essence, unity, necessity, &c., and other similar abstract conceptions of pure intellect. For the first year or two the new professor followed the same track; but he soon discovered, from the examination of his students, that by far the greater number of them comprehended very little of the doctrines explained; that a few only of superior abilities could give any account of them at all, and that the most of the young men remembered only a few peculiar phrases or technical expressions which they delivered by rote, unaccompanied by any distinct notion of their meaning. Besides, even when these abstract doctrines were understood, intelligent persons who sent their sons to the logic class could not fail to observe that the subjects to which their attention was directed had no relation to any profession or employment whatever, and that little could be derived from prelections on such topics, which was likely either to adorn conversation, or to qualify the student for the concerns of active life. Mr. Jardine soon perceived, therefore, the necessity of a thorough and radical change on the subjects of his lectures, and after a simple analysis of the different powers of the understanding, with the means of their improvement, accompanied with a short account of Aristotle's logic, he devoted by far the greater part of the course to the original progress of language, the principles of general grammar, the elements of taste and criticism, and to the rules of composition, with a view to the promotion of a correct style, illustrated by examples. His course of lectures was accordingly entirely new-modelled, and he soon found that a great proportion of the students entered with awakened interest upon the consideration of these subjects, instead of the listless inattention which had been bestowed on the abstract doctrines of metaphysics.

But the greatest improvement which he introduced into the mode of conducting the business of the class was a regular system of examinations and exercises. He was of opinion with Dr. Barrow "that communication of truth is only one half of the business of education, and is not even the most important half. The most important part is the habit of employing, to some good purpose, the acquisitions of memory by the exercise of the understanding; and till this be acquired, the acquisition will not be found of much use." The mere delivery of a lecture, especially to very young persons, he held of very little advantage, unless they were placed in the situation of those who were bound to give an account of it, and the exposition of the rules of composition to be of little avail unless accompanied by the application of those rules by the student himself. Accordingly, at a separate hour in the forenoon the students were examined each day on the lecture of the morning, and written essays were required from time to time on subjects more or less connected with those embraced in the lectures. These were regularly criticized by the professor in the presence of the class; and after the principles of criticism had been explained, they were, towards the end of the session, distributed among the students themselves, who were required to subjoin a written criticism upon each other's performances, under the superintendence of

the professor; and prizes were bestowed at the end of the session, according to the determination of the students, to those who excelled in these daily examinations and exercises. This system of practical instruction is explained in all its details in a work published by Mr. Jardine before he relinquished the charge of the logic class, entitled *Outlines of Philosophical Education*, in which is to be found a full exposition of a system of academical discipline which was pursued in the logic class of Glasgow during the period of fifty years it was under his direction, and which was found by experience to be attended with the most beneficial effects.

The details of this system were, of course, attended with no small additional labour to the professor; for, besides two, and occasionally three, hours each day of public teaching, he had every evening to examine and correct the essays of the students, which were in such numbers as to occupy a large portion of his time. He was reconciled, however, to this tedious and laborious occupation by a thorough conviction of its great practical utility, which each year's additional experience tended more and more to confirm. He had the satisfaction, too, of knowing that his labours were not without success, both from his students themselves, many of whom did not hesitate to ascribe their advancement in after-life to the active and industrious habits acquired in the logic class, and also from the opinion of the public at large, which was very clearly evinced by the progressive increase of the number of students, the average of which, when he entered upon the office, in the public class was about 50, but which increased to nearly 200. This was no doubt partly owing to general causes, applicable to the times, but to a certain extent it was assuredly to be attributed to the great estimation in which this class was held by the public at large. Few teachers have ever enjoyed so large a portion of the respect and affection of their pupils. This was owing not a little to the warm interest which they could not fail to perceive he took in their progress—to his strict impartiality, which admitted of no preference or distinction of any sort except that of talents and industry—and to a kindly, affectionate, and almost paternal regard which marked the whole of his demeanour to his students—who, dispersed as they afterwards came to be into all quarters of the globe, have very generally concurred in expressions of cordial esteem to their old preceptor. With such a hold upon the affection of his class, he scarcely ever required to have recourse to the ordinary means of enforcing academical discipline.

From 1774, when he first entered upon his office, till 1824, when he gave up teaching, the business was systematically carried on in the way here described, with such improvements from time to time as were suggested by his experience; and he possessed such an excellent constitution, aided by a temper remarkably cheerful, that during the whole fifty years he was scarcely a single day absent from his class on account of indisposition. His predecessor, Mr. Clow, survived till 1788, having the year before his death resigned to his successor the whole privileges of the office, with his seat in the faculty; and, notwithstanding the very laborious duties which he had imposed on himself by his mode of teaching, Mr. Jardine still contrived to devote a portion of his time to the extrication of the patrimonial affairs of the college, and the arrangement of their accounts, which his business habits enabled him to undertake without much difficulty, and which, chiefly by his exertions, were brought from a state of comparative confusion into a very satisfactory arrangement. In 1792, likewise, when the Royal Infirmary was erected at Glas-

gow, he bestowed very great labour in promoting the undertaking, and for more than twenty years afterwards officiated as secretary, taking on himself the chief management of the affairs of the institution, from which he only retired a short time before his death, when he received the thanks of the managers for the unwearied attention he had bestowed on their business for nearly thirty years.

The private life of Mr. Jardine did not present any great variety of incident. During the session he lived in college in terms of great friendship with several of his colleagues, particularly with Professors Millar and Young, whose views in college affairs generally coincided with his own; and in summer he resided at a small property which he purchased in the neighbourhood of Hamilton, which he took great delight in adorning, and entered with much relish upon the employments of a country life, which formed an excellent relaxation after his winter labours. His residence in that quarter naturally occasioned a connection with the presbytery of Hamilton, who, for upwards of thirty years, returned him as their representative to the General Assembly, which he regularly attended, taking a considerable share in the business, and generally coinciding in opinion with the late Sir Henry Moncrieff Wellwood, with whom he lived for a great many years in habits of the most unreserved friendship. One of the last public appearances which he made was in May, 1825, upon the question of pluralities, to which he had on all occasions been a determined adversary; when he opened the second day's debate by a forcible speech on the impolicy of uniting professorships with church livings, which, considering his great age, was viewed at the time as a very remarkable effort, and was listened to with profound attention.

In 1824, after having taught for fully half a century, he thought himself fairly entitled to retire from his labours. Those who attended the class during that last session did not perceive any abatement either of his zeal or energy; and during that winter he was not absent from his class a single hour. But he foresaw that the time could not be far distant when these exertions must cease, and he preferred retiring before he was actually compelled to do so by the infirmities of age. At the end of that session he accordingly requested his colleagues to select a person to fill his place, declaring that he left the arrangement entirely to them, and that he would not interfere either directly or indirectly in the appointment farther than by expressing an earnest wish that they might select one who would take a zealous interest in the prosperity of the class, and would continue the same system of active employment on the part of the students which had been found to be attended with so much benefit. Their choice fell upon the Rev. Robert Buchanan, minister of Peebles, who had himself carried off the first honour at this class; whose literary attainments were of a high order, and who zealously continued to follow out the same system of daily examinations and regular exercises which was introduced by his predecessor.

Upon the occasion of his retirement from public teaching a number of those who had been his pupils determined to show their respect by giving him a public dinner in the town-hall of Glasgow, which was attended by upwards of 200 gentlemen, many of whom came from a great distance to evince their respect for their venerable instructor. Mr. Mure of Caldwell, his earliest pupil, was in the chair, and the late Marquis of Breadalbane, who had been peculiarly under his charge at Glasgow College, and to whom he was very much attached, came from a great distance to officiate as croupier.

Mr. Jardine survived about three years after his retirement from public duties, during which time he resided as usual during winter in college, and continued to take an active interest in the affairs of the society. While attending the General Assembly in May, 1826, he was seized with a bilious attack—almost the first illness he ever experienced—from which he never completely recovered, and he sank under the infirmities of age on the 27th of January, 1827, having just completed his eighty-fifth year; contemplating his dissolution with the composure of a Christian, and expressing his gratitude to the Author of his being for the many blessings which had fallen to his lot, of which he did not consider as the least the numerous marks of esteem and regard evinced by his old pupils, with whom he was ever delighted to renew a kindly intercourse. His death was deeply regretted by the society of which he had been so long a member, and by the inhabitants of Glasgow, where he was very generally respected and esteemed.

In 1776 Mr. Jardine married Miss Lindsay of Glasgow, whom he survived about twelve years, and by whom he had one son, John Jardine, advocate, who held the office of sheriff of Ross and Cromarty, and died in 1850.

JEFFREY, FRANCIS.—This eminent barrister, and still more distinguished critic, was born in Edinburgh, on the 23d of October, 1773. His father was George Jeffrey, one of the depute-clerks of the Court of Session; his mother was Henrietta Loudon, daughter of Mr. John Loudon, farmer in the neighbourhood of Lanark. Francis, the subject of our memoir, was the eldest son of a family of five children; and it will be seen, from the foregoing particulars, that the success of his future career, be it what it might, could derive little aid from paternal wealth or interest. After having learned to read and write, he was sent, at the age of eight, to the high-school of Edinburgh, and there he continued six years, employed almost entirely in the dry study of Latin—for in those days the high-school curriculum had not expanded beyond its ancient limits. The first four years of this long course were spent under Mr. Fraser, one of the teachers who had the distinguished honour of being preceptor successively to Walter Scott, Francis Jeffrey, and Henry Brougham; the last two years he was taught by Dr. Adam, rector of the institution, and author of the *Roman Antiquities*, under whose able tuition he matured his knowledge of Latin. One day, towards the close of this course, an incident occurred which seldom fails to influence a young aspiring mind at its outset: he saw one of the truly great, whom the world is proud to worship. On the High Street his notice was arrested by a plain country-looking man, in whose appearance there was nothing remarkable but a pair of large dark eyes, which, when animated, were wont to glow from their deep recesses like lighted charcoal. The young critic even already seemed to have discovered that no ordinary merit was thus passing before his view, so that he continued to gaze after the stranger, until a person standing at a shop-door tapped him on the shoulder, and said, "Ay, laddie, ye may weel look at that man! That's Robert Burns!" After this Jeffrey might say, "*tantum Virgilium vidi*," for although he afterwards enjoyed the intercourse of Campbell, Scott, and Byron, he never saw Burns again.

Having finished his preparatory education at the high-school, Jeffrey, now in his fourteenth year, was sent to the university of Glasgow. His first year was devoted to the study of Greek under Professor John Young, one of the most finished Grecians and elegant scholars of his day; the second to logic,

under Professor Jardine, a teacher in whom the faculty of calling forth the latent capacities of his pupils, and turning them to good account, seemed to be a kind of instinct. He was thus singularly fortunate in having two such preceptors at an educational institution seldom possesses at the same time; and to the benefits which he derived from their instructions he bore a most honourable and enthusiastic testimony many years after, in his inaugural address to the college on being elected its lord-rector. Of Jardine he said, "It is to him and his most judicious instructions, that I owe my taste for letters, and any little literary distinction I may since have been enabled to attain." Such was his declaration when he had attained the very highest literary distinction; and there are some who can still remember how the tears rolled down the cheeks of the good old professor when he found himself thus gratefully and unexpectedly requited. During his third season at college, Jeffrey attended the course of moral philosophy under Professor Arthur, the successor of Reid, a man whose promise of high distinction was closed by an early death. Thus fortunate in his opportunities of superior instruction, the young student devoted himself with earnestness to his successive tasks, and appears, even then, to have indicated not only his future bent, but the eminence he would attain in it. His note-books at the different classes were not merely *memoranda*, but regular digests of the lectures; he was already a keen critic both of sentiment and composition; and in the debating society of the students, of which he was a member, he was soon distinguished as one of its most ready speakers. These aptitudes, however, were still more distinctly exhibited in his private studies from May, 1789, when he left the college of Glasgow, till September, 1791, when he went to Oxford. This interval of a home life, which so many youths of seventeen regard as a season of rest, or spend they know not how, was with Jeffrey anything but a period of repose or frivolity, as his piles of manuscript written between these dates sufficiently attested. Seated by the light of his "dear, retired, adored little window," as he called it, of the garret of his father's house in the Lawnmarket, he handled his already indefatigable pen upon subjects of poetry, history, criticism, theology, metaphysics; and the result of his diligence is attested by twelve letters in the manner of the *Spectator*, and thirty-one essays, the latter being written within the compass of six months, while his criticisms alone comprise fifty authors, chiefly French and English. Even then, too, the voice of prophecy was not wanting to predict his future renown. One night, while taking his "walk of meditation," he found James Boswell, the biographer of Johnson, utterly prostrated upon the pavement by intoxication. It was a fresh case of that *quare adhaesit pavimento*, for which Boswell, on awakening from one of his bivouacs in the street, found in his right hand a brief and retainer. Jeffrey, aided by some lads, carried the fallen worshipper of Paoli and Johnson to his home, and put him into bed. On the following morning Boswell, on learning who had been his benefactor, clapped young Jeffrey's head, and among other compliments said, "If you go on as you have begun, you may live to be a Bozzy yourself yet."

At the close of the last century a conviction or prejudice was prevalent in Scotland, that the education of an English university was necessary to complete that of a Scottish one. It was deemed essential, therefore, that Francis Jeffrey, after having ended his curriculum at Glasgow, should amplify and confirm it at Queen's College, Oxford; and thither accordingly he repaired at the close of

September, 1791. But there he found neither the happiness nor improvement he had expected. His hopes, perhaps, had been raised too high to be fulfilled; and to this disappointment was superadded such a pining consumption of home-sickness as would have been enough for either Swiss or Highlander. It is no wonder, therefore, if, among his letters of this period, we find such a lugubrious sentence as the following:—"I feel I shall never be a great man, unless it be as a poet." In the following month he writes:—"Whence arises my affection for the moon? I do not believe there is a being, of whatever denomination, upon whom she lifts the light of her countenance, who is so glad to see her as I am!" A poet, it is evident, he was in danger of becoming, instead of a censor and scourge of poets; and this melancholy and moon-staring was but the commencement of a hopeful apprenticeship. With the same morbid feelings he contemplated the society around him, and characterized them all as drunkards, pedants, or coxcombs. Few men depended more upon locality for happiness than Jeffrey, and Scotland was not only his native country, but his native element. To this, therefore, and not to any inherent defects in the education or students of Oxford, we may trace his querulous murmurs; so that the whole world was changed when he looked at it from Arthur's Seat or the Pentlands.

On returning to Edinburgh at the age of nineteen, Jeffrey appeared little changed by his sojourn in England. He was the same vivacious, slim, short stripling as before, with the same wide range of thought and fluency of language that had so often charmed or nonplussed his companions. In one respect, however, a material change had occurred; he had abandoned his native Doric dialect for that sharp, affected, ultra-English mode of pronunciation, which afterwards abode with him more or less through life, and which was in such bad taste, that Lord Holland declared, "Though he had lost the broad Scotch at Oxford, he had only gained the narrow English." It was now full time to make choice of a profession in good earnest, and prepare for it, as hitherto his law studies at Oxford had been little more than nominal. He might, if he pleased, be a merchant under his paternal uncle, who was settled at Boston in America; but he felt no vocation for mercantile labour and adventure. Literature he would have chosen in preference to anything, and, of all literary occupations, that of poetry; but authorship as a trade was too precarious, and the fame of a poet too unsubstantial. Then there was the English bar, which gave full scope to the utmost ambition; but Jeffrey knew withal that the great expense of preparation, followed by that of waiting for practice, was more than his resources could encounter. Nothing remained for him but the profession of a Scottish advocate, for which his father's legal acquaintanceships could secure him as much practice as would suffice for a commencement. Here, then, his choice rested, and he became a student of the classes of Scotch law in the university of Edinburgh. But besides these he had, in the Speculative Society, of which he became a member at the end of 1792, a still more effectual spur to progress, as well as better training both for law and criticism. This society had been established in the college of Edinburgh in 1764, for the purposes of reading literary and scientific essays, and holding forensic debates upon the subjects of these essays; it had already produced during the forty-eight years of its existence some of the most distinguished characters of the day; and when Jeffrey enrolled he found himself a fellow-debater of those who afterwards obtained the foremost

name in their respective walks of life. Of these it is sufficient to name Sir Walter Scott, Lord Brougham, Lord Moncrieff, Francis Horner, and William Scarlett, at that time young men, but with whom it was impossible for the most talented to contend without being braced by such formidable exercise. It was no wonder, therefore, that by such weekly meetings Jeffrey soon perfected himself in the practice of composition, and became a ready and eloquent debater. Three years was the usual period of attendance; but after this term he continued for four years a voluntary visitor, and took part in its proceedings with unabated interest. In 1834, when he had reached the full summit of his reputation as sovereign of the empire of criticism and champion of the Scottish bar, he presided at a dinner to celebrate the seventieth anniversary of the institution, and gloried in acknowledging the benefits he had derived from it.

Jeffrey had now reached his twentieth year, and was busy in preparation for passing as a Scottish advocate, while he thus characterized himself: "I have lived on this earth very nearly one score of years, and am about to pass some professional trials in a few months, who have no fortune but my education, and who would not bind myself to adhere exclusively to the law for the rest of my life for the bribery of all the emoluments it has to bestow." He had so learned to love literature for its own sake, that, be his occupation what it might, his favourite recreations would still be found in criticism and the *belles-lettres*. This he afterwards more distinctly intimated in a letter to his brother, where he writes: "I shall study on to the end of my days. Not law, however, I believe, though that is yet in a manner to begin; but something or other I shall—I am determined." But what was that something? as critic or poet—reviewer or reviewed? It will scarcely be believed, that while studying law he had also been equally diligent in verse-making, so that a poetical translation of the *Argonauticon* of Appollonius Rhodius, two dramatic productions, and a large bundle of descriptive and sentimental poems, were the fruits of this dangerous pursuit. Happily, however, a healthier spirit was rising within him; and he manifested it by keeping his poetry not merely from the press, but the perusal of his friends. At length the full cure of this intermittent disease was effected on the 16th of December, 1794, for on that day he was admitted to practise as an advocate at the Scottish bar—an occupation from which there is no retreat except to politics or agriculture, and a place at which of all others the Muses have least dared to intrude.

The position which the northern barristers at that period occupied could only be peculiar to such a country as Scotland. In England, indeed, the occupation could raise a talented practitioner to greater wealth and higher political rank; but the English bar was only a part of the great whole, and had but a single voice in the complicated administration of the common weal; and to whatever height it might lead its best and ablest, there was still a summit above them which they could not reach, and under which they were overshadowed. But in Scotland the case was different. The union that had annihilated every national distinction had left our tribunal untouched. Here, then, was the place around which the whole nationality of the country could rally, and through which the *ingenium perfervidum* could find utterance; and therefore the Parliament House, besides being a court of law, was palace, council, and senate of the now abrogated kingdom of Scotland. Such were the attractions which the Scottish bar possessed, and hitherto they had sufficed, not only

for the highest talent, but the best aristocracy of the country. But here, also, the old feudalism of Scotland had made its last rallying effort, so that the divine right of kings, the unquestionable right of lairds, and the superiority of everything that was ancient, were the favourite axioms of the Edinburgh Court of Session. All this, indeed, would soon have died out had it not been for the French revolution, which ministered new fuel to an already decaying flame, and made it burst forth with greater vigour than ever. While every nation took the alarm, and began to draw the old bands of order more tightly around its institutions, this process was judged especially necessary for Scotland, which had neither king nor parliament of its own, and was therefore deemed the more likely to join the prevalent misrule. Modern Toryism was therefore ingrafted upon the ancient Scottish feudalism, and unqualified submission became the order of the day. Even the distance from the seat of government only made our northern politics the more sensitive to every indication of independent thought or action; and thus, what was nothing more than Whiggery within the precincts of Westminster, was sheer rebellion and high treason in the Parliament Square of Edinburgh.

Such was the condition of that honoured and influential class into which Jeffrey was now admitted. It will at once be seen that the difficulties of his new position were of no trivial amount. Even at the outset his undistinguished birth was against him; and those who belonged to the "lordly line of high Saint Clair" could scarcely be expected to admit the son of a clerk-depute into full fraternity. He undoubtedly possessed a superiority of talent that might more than counterpoise such inferiority; but here, instead of holding the field without a rival, he had many who were fully his match—competitors as well equipped for the encounter, and who attained as high professional rank and reputation, as himself. Still, however, one remedy remained. The tide of Toryism was at the height, and by throwing himself implicitly upon it, he would be borne onward to fortune. And this, too, he might do not only without degradation, but with universal approval; for loyalty was the order of the day, and every step was commended that went against the anarchy with which throne and altar were menaced. But Jeffrey was a Whig. From an early period he had revolved the questions of civil and political liberty, and instead of discarding them as the mere Brutus and Cassius dreams of college boyhood, he had clung to them with all the greater tenacity as years went onward; and now that he was about to enter into active life, he boldly avowed them as the conclusions of his matured judgment, and the principles of his future political conduct. And what chance had he, then, of success in a profession where his opinions of popular rights were not only condemned as mischievous, but despised as vulgar and mobbish? There were men, indeed, not only in Edinburgh, but even the Court of Session, who in political principles were like-minded with himself; but they were for the most part so independent, either by family, or fortune, or position, that they could better afford to oppose the prevailing current than a young man to whom the pathway of life was just opened, with nothing but his own energies to bear him forward. Taking all these circumstances into account, there is none, be his principles in politics what they may, who can refuse to Jeffrey the award of unswerving integrity and high heroic consistency. And truly he reaped the reward he merited, not only in his own advancement, but the final ascendancy of those obnoxious political doctrines which he so bravely advocated and consistently maintained.

On commencing practice at the bar, Jeffrey laboured under a difficulty upon which perhaps he had not calculated. This was the unlucky half English mode of speaking which he had learned or assumed at Oxford, but which he had not the good taste to discard at Edinburgh; and such was the strength of popular prejudice at this period, that there were few who would not have scrupled to intrust the management of a law case to an "Englified" pleader. With this mode of speech, which was thought to savour of affectation, he combined an oppressive sharpness of tone, volubility of words, and keenness of sarcasm, calculated to wound the self-love of those who could not parry and return the thrusts of such an agile fencer. His business, therefore, as an advocate went on very slowly, and his fees were proportionably scanty. Most of the cases, indeed, which passed through his hands, were obtained by the influence of his father. The necessity of having some other dependence than the bar became so strong, that in 1798 he conceived the idea of commencing authorship in London as his future profession; and for this purpose he repaired thither, furnished with introductions to the editors of some of the principal reviews and newspapers, and buoyed up with the expectation that he would quadruple the scanty revenue that he could ever hope to enjoy from his profession in Edinburgh. But London was not destined to be his sphere, and notwithstanding his introductions, he got so little encouragement that he was soon glad to return. He resumed his very limited practice as an advocate, although with a thousand plans of emancipation that ended as such dreams generally do, but still improving his knowledge, as well as increasing the circle of his literary acquaintances. At length, as if to place the copestone upon his desperate fortunes, he adventured upon marriage, and in 1801 became the husband of Catherine Wilson, daughter of the Rev. Dr. Wilson, professor of church-history at St. Andrews, a second cousin of his own. Jeffrey's income at this time averaged nothing more than £100 per annum, while his wife had no fortune, except the inestimable one of an amiable affectionate disposition and pleasing manners, that shed a gentle charm over her whole household economy. The happy pair established their domicile in a third story of Buccleugh Place, which they furnished upon the most cautious scale of economy. But it was in the study of this dwelling, and around the plain table and few chairs of which the study could boast, that a plan was formed by which not only the literature of Scotland, but of Europe itself, was to be revolutionized, and upon which Jeffrey himself was thenceforth to depend for the high literary reputation and prosperous career that accompanied him to the end.

We allude to the establishment of the *Edinburgh Review*. Hitherto, in the critical department of literature in England, a review had been little more than a peg upon which to hang a book for advertisement; and the individual merits of each work were more attended to than the great general questions of science, literature, or politics, which it more or less involved. In Scotland the department of criticism was at a still lower ebb; for the country had no regular review, the only one which it possessed, called the *Edinburgh Review*, having expired in 1756, after a short twelvemonth of existence. But the world was ripe for change, and the whole framework of intellectual and political society was already loosening, for the purpose of being resolved into new forms and combinations. It was evident, therefore, that either in London or in Edinburgh some standard periodical should be established, to meet, and if

possible to direct and control, the coming change—and this, it was evident, could only be done by a more ample system of reviewing than had hitherto been attempted. Such was the impression that for some time had been floating through the minds of the more observant in Edinburgh; but to embody that impression, and reduce it to action, was still the difficulty. This, however, was soon obviated. A meeting of Jeffrey's literary friends was assembled at his dwelling in Buccleugh Place, and there the idea of such a review was started, and the plan of its management deliberated. The proposal was due to the Rev. Sydney Smith, who is entitled "the original projector of the *Edinburgh Review*;" an eager discussion followed; and as the night without was very tempestuous, the coterie made themselves merry with the thought of the still greater storm they were devising within. The plan, after several such meetings, was settled, and it was resolved to bring out the first number of the work in June, 1802, but, from several causes, the publication was delayed till the 10th of October. Its descent upon the literary world was followed by a burst of astonishment—it exhibited such a form and character of criticism as the British public had never yet thought of—and that such should have been produced in a remote nook like Edinburgh greatly heightened the general wonderment. The contributions of Jeffrey on this occasion were five in number, and his critique upon "Mourier on the Influence of the French Revolution," was the first in the work. His importance in the future character and success of the *Review* was even thus early predicted by Horner, also one of the contributors, who made the following entry in his private journal:—"Jeffrey is the person who will derive most honour from this publication, as his articles in this number are generally known, and are incomparably the best. I have received the greater pleasure from this circumstance, because the genius of that little man has remained almost unknown to all but his most intimate acquaintances. His manner is not at first pleasing; what is worse, it is of that cast which almost irresistibly impresses upon strangers the idea of levity and superficial talents. Yet there is not any man whose real character is so much the reverse. He has, indeed, a very sportive and playful fancy, but it is accompanied with an extensive and varied information, with a readiness of apprehension almost intuitive, with judicious and calm discernment, with a profound and penetrating understanding." It was no small praise that Jeffrey should already have acquired so high a character in a talented community such as we might now look for in vain in Edinburgh. The chief of these, besides Horner himself and Sydney Smith, were Lord Brougham; Brown, the professor of moral philosophy; Lord Webb Seymour; Mr. Hamilton, afterwards professor of Sanscrit at Halesbury College; Dr. John Thomson, who became professor of pathology in the university of Edinburgh; Mr. Reddie, afterwards town-clerk of Glasgow; Mr. Thomas Thomson, the eminent Scottish antiquary; and Lord Murray, late judge of the Court of Session. All these were young men full of talent and ambition, to whom the *Edinburgh Review* at its commencement was a vent for feelings and theories that had been accumulating for years. Above all, it enabled them to give full utterance to those political principles that were so obnoxious to the rulers of the day, and so doubly proscribed in Scotland. Each individual no longer stood alone, but was part of a collected and well-disciplined phalanx; and instead of being obliged to express his opinions in bated breath, and amidst an overwhelming uproar of contradiction, he could now announce them in full and

fearless confidence, through a journal which was sure of being heard and feared, at least, if not loved and respected.

As the *Edinburgh Review* was a new experiment in literary adventure, its outset was accompanied with many difficulties, arising from want of experience among its chief conductors; and therefore it was obliged, in the first two or three years of its existence, to grope its way, step by step, as it best could. It was launched even without a pilot, for Sydney Smith edited no more than the first number. The meetings of the contributors were held with all the dread and mystery of a state-conspiracy, in a little room off Willison's printing-office in Craig's Close, to which each member was requested to steal singly, by whatever by-way would be least suspected; and there they examined and criticized each other's productions, and corrected the proof-sheets as they were thrown off. These contributions, also, for the first three numbers at least, were given gratuitously. No journal, it was soon felt, could long make head against such deficiencies; and the first important advance in improvement was to appoint Jeffrey sole and responsible editor. The dismal and ludicrous secret meetings in the back-room of the printing-office quickly disappeared—for what author, however in love with the anonymous, could long continue to be ashamed of being a writer in the *Edinburgh Review*! The rapid sale of the work and the large profits it realized made the payment of articles a necessary consequence, and therefore the first remuneration was fixed at ten guineas a sheet, which rose to sixteen as the *minimum* price, while the editor was salaried at £300 per annum. By these changes a coalition of talented writers was bound together, and pledged to the furtherance of the work. But the life and soul of that coalition was Jeffrey, and nothing could have been more appropriate than his appointment to the editorship. Unconsciously he had made his whole life a training for the office, not only by the multifariousness of his studies, but his early practice of analyzing the authors he read, as well as his own miscellaneous compositions, so that the practice as well as the talents of a critic were ready for instant action. On the appointment being offered to him he had some dubitation on the subject, which he thus expresses at full to his excellent friend and adviser, Francis Horner:—"There are *pros* and *cons* in the case, no doubt. What the *pros* are I need not tell you. £300 a-year is a monstrous bribe to a man in my situation. The *cons* are—vexation and trouble, interference with professional employment and character, and risk of general degradation. The first I have had some little experience of, and am not afraid for. The second, upon a fair consideration, I am persuaded I ought to risk. It will be long before I make £300 more than I now do by my profession, and by far the greater part of the employment I have will remain with me, I know, in spite of anything of this sort. The character and success of the work and the liberality of the allowance are not to be disregarded. But what influences me the most is, that I engaged in it at first gratuitously, along with a set of men whose character and situation in life must command the respect of the multitude, and that I hope to go on with it as a matter of emolument along with the same associates. All the men here will take their ten guineas, I find, and, under the sanction of that example, I think I may take my editor's salary also, without being supposed to have suffered any degradation. It would be easy to say a great deal on this subject, but the sum of it, I believe, is here, and you will understand me as well as if I had been more

eloquent: I would undoubtedly prefer making the same sum by my profession; but I really want the money, and think that I may take it this way, without compromising either my honour or my future interest.

Such was the train of reasoning by which Jeffrey committed himself to the *Review*. It was that important step in life which a man can take but once, and by which the whole tenor of his after-course is determined. In Jeffrey's case it was both wise and prosperous, notwithstanding the manifold feuds of authorship in which it necessarily involved him. It was not merely from the small fry of writers, who writhed under his critical inflictions, that these quarrels arose; but also from men of the highest mark, whom he tried by a standard proportioned to their merits, and therefore occasionally found wanting. In this way he offended such distinguished authors as Scott, Byron, Southey, Wordsworth, and Coleridge; but in most instances the resentment he kindled was transient, and followed by a cordial reconciliation. Even Byron, the most indignant and most formidable of the whole, recanted his vilifications of Jeffrey in a much higher strain of poetry than that which characterized his *English Bards and Scotch Reviewers*. But of all these quarrels, that with Thomas Moore threatened to be the most serious. In 1806 the young poet of Erin published a volume, which will ever remain a blot upon his fair fame. It was entitled *Epistles, Odes, and other Poems*; and notwithstanding its undoubted merits, which no one was more ready to acknowledge than Jeffrey, he opened his critique with such a burst of indignation as the offence of the poet merited. After acknowledging the high talents of Moore in a few sentences, the reviewer thus continues: "He is indebted, we fear, for the celebrity he actually enjoys to accomplishments of a different description; and may boast, if the boast can please him, of being the most licentious of modern versifiers, and the most poetical of those who, in our times, have devoted their talents to the propagation of immorality. We regard his book, indeed, as a public nuisance, and would willingly trample it down by one short movement of contempt and indignation, had we not reason to apprehend that it was abetted by patrons who are entitled to a more respectful remonstrance, and by admirers who may require a more extended exposition of their dangers." The article throughout was judged to be so personal, that the poet resolved to redress himself in another way than by writing a rejoinder, either in prose or verse. In short, he resolved to call the critic out, a purpose which he was enabled to effect in consequence of a visit that Jeffrey made to London a short time after the article was published. The hostile parties met in a field near London, and Jeffrey was attended on this occasion by his friend Horner. The police, however, had got intelligence of their purpose, and arrested the combatants when the duel was about to commence. On reaching the police-office the pistols were examined, when it was found that Jeffrey's contained no bullet, as it had probably dropped out when the weapon was snatched from him; while that of the poet was furnished with the usual complement of lead, and ready for execution. A foolish affair in itself, the meeting was rendered more ridiculous still by the reports that were founded upon the harmless pistol, both weapons being represented as in the same condition, and fit to produce nothing more than a little noise. The offending parties, being bound over to keep the peace, resolved to adjourn the combat to the neutral ground of Hamburg. But better thoughts occurred, and an explanation fol-

lowed, in which Jeffrey declared that it was the morality of the book, and not of the man, which he had judged and condemned; while Moore professed himself satisfied with the explanation. Nothing was more natural than that two such fiery spirits should pass from the extreme of dislike to that of friendship; and such was the case with Moore and Jeffrey, whose affection for each other continued till the close of life.

We have already seen the misgivings of Jeffrey as to the effect which his literary censorship would produce upon his progress at the bar. In this respect his fears were happily disappointed; for, although his progress was not rapid, it was steadily growing from year to year, accelerated on the whole, rather than retarded, by his office of reviewer. The literary society of Edinburgh, also, was constantly increasing, and among these he was enabled to take an important stand, as the highest and most influential of British critics. Even the death of his amiable wife, which occurred in 1805, and which he felt more deeply than any calamity that ever befell him either before or after, only drove him more keenly into the duties of active life. And these were neither few nor trivial; for, besides his practice, both in the civil and criminal courts, he took an important share in the legal business of the General Assembly, in which he continued a pleader for twenty years. Saving this mournful domestic bereavement, all things went prosperously onward, so that by the commencement of 1807 he thus writes to his brother: "I work at the *Review* still, and might make it a source of considerable emolument if I set any value on money. But I am as rich as I want to be, and should be distressed with more, at least if I were to work more for it." Of the journal itself, also, Sir W. Scott, who disliked its political principles with a full measure of feudal and Tory dislike, thus testifies to its popularity: "Of this work 9000 copies are printed quarterly, and no genteel family can pretend to be without it; because, independently of its politics, it gives the only valuable literary criticism which can be met with." This unprecedented success not only alarmed the enemies of political innovation, but excited their literary ambition. Could not a coterie be assembled in London as learned and talented as that of Edinburgh, and an antagonist journal be started as formidable as this critical Goliath? At length the decision was precipitated by an article in the *Edinburgh Review* for October, 1808, on "Don Pedro Cevallos on the French Usurpation of Spain." This talented paper, written by Jeffrey himself, which ventured to run counter to the political enthusiasm of the day upon the subject of Spanish patriotism, excited the Tory resentment to the highest pitch; and the feeling was expressed in every form, from the magnificent disdain of the Earl of Buchan—who kicked the offensive number through his lobby, and into the street, believing that thereby he had sealed for ever the fate of the *Edinburgh Review*—to the calm but stern disapproval of Sir Walter Scott, who thus wrote to its publisher: "The *Edinburgh Review* had become such as to render it impossible for me to continue a contributor to it; now it is such as I can no longer continue to receive or read it."

The plan of the *Quarterly*, which had for some time been contemplated, was soon arranged, and its first number appeared in February, 1809. It is honourable to the *Edinburgh Review* to state, that its system of management was the one adopted by the new rival journal, at the recommendation of Sir Walter Scott. This plan was unfolded by Sir Walter in a letter to Gifford, the newly-appointed editor

of the *Quarterly*, previous to its commencement. His letter, from which we give the following extract, sufficiently shows how essential Jeffrey had been to the prosperity of the *Edinburgh periodical*, as well as the sagacious measures which he had adopted for the purpose. Indeed, they may be said to have formed the exemplar of all the numerous magazines of our day:—"The extensive reputation and circulation of the *Edinburgh Review* is chiefly owing to two circumstances: first, that it is entirely uninfluenced by the booksellers, who have contrived to make most of the other reviews merely advertising sheets to puff off their own publications; and, secondly, the very handsome recompense which the editor not only holds forth to his regular assistants, but actually forces upon those whose circumstances and rank make it a matter of total indifference to them. The editor, to my knowledge, makes a point of every contributor receiving this *bonus*, saying that Czar Peter, when working in the trenches, received pay as a common soldier. But there is still something behind, and that of the last consequence. One great resource to which the *Edinburgh* editor turns himself, and by which he gives popularity even to the duller articles of his *Review*, is accepting contributions from persons of inferior powers of writing, provided they understand the books to which the criticisms relate; and as such are often of stupifying mediocrity, he renders them palatable by throwing in a handful of spice—namely, any lively paragraph, or entertaining illustration, that occurs to him in reading them over. By this sort of veneering, he converts, without loss of time or hindrance of business, articles which, in their original state, might hang in the market, into such goods as are not likely to disgrace those among which they are placed." In this way Jeffrey plumed many a heavy article, and sent it soaring heavenward, which, without such aid, would have been doomed to dabble in the mud. It is evident, however, that this, the most important, was also the most difficult, of all editorial labours; and without a very skilful hand, would have converted the process of fine veneering into clumsy patchwork. It must have been amusing in not a few cases, to see a grave contributor to the *Edinburgh Review* reading his article for the first time in print, and wondering at his own wit and vivacity!

Notwithstanding the merited success of the *Quarterly*, Jeffrey felt neither envy nor alarm; there was now room enough in the literary world for both journals, and the excellence of the one was a healthy stimulus to the other. His affairs were also so prosperous, that after successive removals to more fashionable mansions in Edinburgh, he was enabled, in 1812, to occupy a country-house at Hatton, near Edinburgh, once a seat of the Earls of Lauderdale. This antique residence was soon enlivened by an additional tenant. In 1810 Jeffrey had met with Miss Charlotte Wilkes, grand-niece of the celebrated John Wilkes, who was on a visit to Edinburgh with her uncle and aunt, and this acquaintance ripened into an attachment, that was followed by marriage in 1813. As the lady, however, resided in New York, it was necessary that Jeffrey should repair to America for his bride; and thither accordingly he went, notwithstanding his invincible abhorrence of the sea, and impatience of the restraints of navigation. His journal of the voyage, as might be expected, is a wrathful enumeration of cloudy skies, gales, sea-sickness, lumbered decks, soured companions, and squalling children; ending with "If I get back safe to my own place from this expedition, I shall never willingly go out of sight of land again in my life." It was well that such a consolation

awaited his landing, in one who, for thirty-four years, was the comfort of his life and enliverer of his home. At his return to Edinburgh, in the beginning of 1814, he threw himself into the work of the *Review* with fresh ardour, for the disastrous campaign of Napoleon in Russia, and the series of important events that rapidly followed, by which the whole history of the world was changed, gave full scope to his political prelections. In 1815 he removed his country residence from Hatton to Craigcrook, about three miles to the north-west of Edinburgh, and there his summers were spent till the close of his life. The mansion at first consisted of nothing but an old tower; but this and the adjacent grounds he enlarged, improved, and beautified, as he would have done with some article for the *Review* that was too dull to be published in its original state, but too good to be neglected. By successive additions the building was expanded into a stately baronial residence, while the thirty or forty acres that surrounded it gave full exercise to that taste for the pleasing and the beautiful which hitherto he had expressed only in theory. There, also, he gathered round him such distinguished characters as Atticus himself might have envied. "What can efface these days," exclaims his affectionate biographer, "or indeed any Craigcrook day, from the recollection of those who had the happiness of enjoying them!"

A change in the Scottish tribunal at the beginning of 1816 brought Jeffrey into greater legal practice than ever. This was the introduction of juries for the trial of facts in civil causes; and for such a department he soon showed himself well fitted, by his versatile intellectual powers, the variety of his knowledge, and ready command of every kind of oratory. Here, too, the fact of his connection with the *Review*, instead of retarding his progress, only brought him clients in multitudes, for he was now recognized as the champion of popular rights, as well as a most able and accomplished pleader. Yet, with this great addition to his professional duty, neither his diligence nor productiveness as a writer was abated, so that, independently of his wonted labours in the *Review*, he wrote the article "Beauty" in the *Encyclopædia Britannica*—a treatise that, notwithstanding the fluctuating nature of every theory upon that subject, will always continue to be admired for the metaphysical depth of its sentiments, and the classic finished elegance of its style. This tide of success, however, was on one occasion interrupted. Strange to tell, Jeffrey stuck a speech! In 1818 John Kemble was about to take leave of the Scottish stage; and as his admirers proposed to give him a public dinner in Edinburgh, Jeffrey was commissioned to present him a snuff-box at the banquet. He rose for the purpose with full confidence in that extemporaneous power which had never failed him; but when the dramatist raised his kingly form at the same instant, and confronted him with magnificent obeisance, the most fluent of speakers was suddenly struck dumb—he sat down, with his speech half-finished and his gift unrepresented!

It was now time that honorary distinctions as well as substantial profits should descend upon the successful critic and barrister, so that he should become something more than plain Francis Jeffrey. These were now at hand; and the first that adorned him appropriately enough came from a seat of learning. His own college of Glasgow had not lost sight of its early *alumnus*; and after having elected the highest and most talented to the office of lord-rector of the university, the claims of the prince of critics to fill it ought not to be overlooked. So felt the young students, by whose suffrages the rector is chosen,

and in 1820, notwithstanding the hostility of the professors, whose dislike of Jeffrey's Whiggism could not be overcome, he was invested with the honoured distinction. After this, proposals were made from influential quarters to obtain for him a seat in parliament; but these he declined: it was from the court of law and not the senate that his next honours were to be obtained. Accordingly, in 1829, he was unanimously elected dean of the Faculty of Advocates, the highest honour which his own profession can bestow, and all the more honourable that the election was by the votes of his brethren. It was no trivial indication of political change, that the editor of the *Edinburgh Review* should have been appointed to such an office, in the very heart of Edinburgh, and by a body of men who had in former times been the keenest and most influential champions of Toryism. It was necessary, however, that his editorship should cease, and he gladly resigned it into younger hands. It was not an easy sacrifice to relinquish an office so congenial to his tastes and habits, which he had held for twenty-seven years, and which he had raised by the force of his talents to such high distinction in the literary and political world. The list of his contributions during this period is truly astounding, not only for quantity, but variety. They amounted in all to 201 articles, a selection from which was published in eight volumes, under his revision, in 1843. After having been dean of faculty for a very short period, Jeffrey, in 1830, was appointed lord-advocate. This office, although resembling that of the attorney-general in England, has few recommendations, beyond those of mere distinction, to a successful practitioner at the Scottish bar; for, besides affording a salary of only £300 per annum, it has legal and political duties attached to it sufficient for the utmost energies of the most talented individual. For three years and a half he continued in this laborious office, during which period he was almost exclusively occupied with the important measures of parliamentary and burgh reform, and spent much of his time in attendance upon the House of Commons, which he did as member for the Forfarshire burghs, and finally for the burgh of Malton. His situation in the House of Commons was anything but a sinecure, as the passing of the reform bill for Scotland, of which he was the official manager, cost him many speeches and sleepless nights, as well as a vast amount of daily anxiety. After this great work was successfully accomplished, his chief ambition was to represent his native city in the first reformed parliament. Nothing, indeed, could be more legitimate than such ambition after the toils he had undergone in the cause of reform, not merely as Lord-advocate of Scotland, but also as the ablest of political writers in behalf of the measure, when its very idea was reckoned tantamount to high-treason. His wish was gratified. He was put in nomination as candidate for the representation of Edinburgh, and returned by a majority of votes on the 19th of December, 1832, after which he resumed his parliamentary duties, and the incessant worry with which the adjustment of the details of the Reform Bill was connected. While thus employed, a vacancy occurred on the bench of the Court of Session, in 1833, and Jeffrey was appointed to this, the highest office which a Scottish lawyer can attain. But what he valued more highly was, that it freed him from the harassing labours of parliament, and those of lord-advocate, and restored him to the society of his friends and full enjoyment of his home. It was the natural feeling of one who had already passed three-score years of life, and passed them in severe toil and intellectual exertion.

Having ceased from his avocations as lawyer and reviewer, and passed into that peaceful but dignified office to which his merits had so honourably won their way, the rest of the narrative of Jeffrey's life may be briefly told. On the 7th of June, 1834, he took his seat on the bench, with the title of Lord Jeffrey, instead of assuming a territorial one from the landed property which he possessed. Was this humility, eschewing a pompous designation as savouring too much of aristocracy and feudalism—or pride, that felt as if his own family name had now been raised to such distinction as to make a lordly change unnecessary? Both feelings may have been so curiously blended in the choice, that it would be better to leave them unquestioned. At all events, the familiar name of Jeffrey was more grateful to the literary ear than Lord Craigcrook, or any other such title could have been. His official duties required his attendance in the court every morning at nine o'clock, and thus, with him, the virtue of early rising was enforced by necessity. During the winter, when the court was sitting, his place of residence was Edinburgh; he then usually repaired in spring to London or its neighbourhood; and in autumn he lived at his residence of Craigcrook, which seemed every year to become more and more endeared to him. Having now so much leisure upon his hands, and that too, it may be added, for the first time in his life, he was often urged by his friends to write some important original work, in which his whole intellectual power would be condensed, and his fame embodied for the esteem of posterity when the *Edinburgh Review* itself would be supplanted by younger and more popular candidates. But to this his answer was, "I have no sense of duty that way, and feel that the only sure or even probable result of the attempt, would be hours and days of anxiety and unwholesome toil, and a closing scene of mortification." It was the apology of one who had already written so much that he had become weary of the task—or who had written so well, that he was afraid of risking all he had already won upon such a final and decisive cast. At all events, he rested satisfied with the fame he had already acquired, and in this way it may be that he acted wisely. On the 27th of June, 1838, his daughter, and only child, was married to William Empson, Esq., professor of law in the East India College, Haileybury; and this union, besides imparting an additional charm to his yearly visits to England, produced to him those solaces for his old age, which perhaps a new successful literary undertaking would have failed to impart. These were the little grandchildren who were soon entwined like rich tendrils around his affectionate heart, and in whose society he renewed all the freshness and buoyancy of his early youth.

In his capacity of judge, Lord Jeffrey was connected with those decisions of the Court of Session that preceded the disruption of the Church of Scotland; and his award was in favour of that party by whom the Free Church was afterwards constituted. He took an intense interest in the whole controversy from the commencement, and even at an early period foresaw that a disruption was inevitable, while he lamented such a fatal necessity. But still his heart was with the dissentients, for he saw that they could not act otherwise consistently with their convictions as to the spiritual independency of the church. Thus he felt while their case was discussed in the Court of Session, and afterwards removed by appeal to the House of Lords, and he regarded the final award of the supreme tribunal as short-sighted, unjust, and tyrannical. At length the crisis approached, for the meeting of the General Assembly of 1843 was at

hand. His interest about the result in the great coming conflict of the church was thus expressed: "I am anxious to hear what her champions and martyrs are now doing, and what is understood to be their plan of operation at the Assembly. It will be a strange scene any way, and I suppose there will be a separation into two assemblies." He knew too well the elements of the Scottish character, and was too conversant with the history of our national church, to believe, as most of the politicians of the day believed, that the opposition of the evangelical party would break down at the last moment under the argument of manse, glebe, and stipend. But would the secession be on such a scale as to constitute a great national movement? Or when the crisis came, might there not be such a fearful winnowing as would reduce the protesting party to a mere handful? At length the day and the hour of trial arrived. Jeffrey was reading in his study when tidings were brought to him that the whole body had departed as one man—that 450 ministers had fearlessly redeemed their pledge to sacrifice their earthly interests at the command of duty, and had left the assembly, to constitute another elsewhere! He threw the book from him, and exclaimed in a tone of triumph, "I am proud of my country! no other than Scotland," he added, "would have acted thus."

The remainder of Lord Jeffrey's life was passed in the enjoyment of a happy old age, his duties of judge, to which he attended to the last, being alternated with social intercourse, domestic enjoyment, and reading—that incessant process of acquiring new ideas, without which it seemed as if he could not have survived for a single hour. Thus his course went on till the close of 1849; but though still exhibiting much of his former activity, as well as enjoying every source of happiness, he knew that this must soon terminate. "I have made," he thus writes to his son-in-law and daughter, "a last lustration of all my walks and haunts, and taken a long farewell of garden and terrace and flowers, seas and shores, spiry towers and autumnal fields. I always bethink me that I may never see them again." He had indeed seen the last of his autumns; for on the 22d of January following, after a brisk afternoon walk round the Calton Hill, he was attacked by bronchitis, a complaint to which he had for several years been more or less subject; but so little did he apprehend the consequences, that he thought that at the worst they would only compel him to resign his place on the bench. But death was advancing with a swift though silent step, and after four days of illness, in which he suffered little, and anticipated a speedy recovery, he breathed his last. This was on the 26th of January, 1850. He, too, felt his ruling passion strong in death; for in his dreams during the three nights previous to his dissolution, the spirit of the Edinburgh reviewer predominated, so that he was examining proof-sheets, reading newspapers, and passing judgment upon arguments or events as they rose before his mind's eye in the most fantastical variety. During the last year of his life his walks had carried him to the Dean Cemetery, where, amidst its solemn vistas, enlivened with the song of the blackbird, he had selected the spot which he wished to be his final resting-place; and there accordingly his remains were deposited on the 31st of January.

Mrs. Jeffrey outlived her husband only a few months. She died at Haileybury on the 18th of May, and her remains were interred beside his in the Dean Cemetery.

JOHNSTON, SIR ARCHIBALD, of Warriston (a judge by the designation of Lord Warriston), an

eminent lawyer and statesman, was the son of James Johnston of Beirholm in Annandale, a descendant of the family of Johnston in Aberdeenshire, and who for some time followed a commercial life in Edinburgh, being mentioned in a charter of 1608 as "the king's merchant." The mother of the subject of our memoir was Elizabeth, daughter of Sir Thomas Craig, the first great lawyer produced by Scotland, and whose life has already been given in the present work. Of the date of the birth of Archibald Johnston, and the circumstances of his education, no memorial has been preserved: he entered as advocate in 1633. In the great national disturbances which commenced in 1637 Johnston took an early and distinguished part, acting apparently as only second to Sir Thomas Hope in giving legal advice to the Covenanters. The second or general supplication of the nation to Charles I. for relief from his Episcopal innovations was prepared by the Earl of Rothes and Archibald Johnston—the former being preferred on account of his distinction as an active and influential partisan, and the latter from the general character given of him by his friends, as singularly well acquainted with the history and constitution of the genuine Presbyterian Church of Scotland. This document, which was presented to the privy-council on the 24th of September, 1637, in the presence of a band of the supporters of its principles, which made the act more solemn than a regal pageant, leaves for the politicians of all ages a fine specimen of that calmness in reasoning and statement which men of judgment and principle know to be necessary for the preservation of order in a state when they are representing grievances, however deep, to a governor, however unreasonable; and of that firmness of position which, when supported by a hold of popular opinion, must either be allowed to prevail, or leave to him who obstructs it the odium of the confusion which may follow. After the supplicants, who had increased to a vast body of men, spreading over the whole of the southern part of Scotland, had united themselves under a representative constitution, termed "The Tables," a renewal of the national covenant was judged a useful measure for a combination of effort and the insurance of a general union and purpose. Johnston and the celebrated Alexander Henderson were employed to suit the revered obligation to which their ancestors had sworn, to the new purpose for which it was applied, by including the protestations against the liturgy of the Episcopal church, under the general declarations which it previously bore against the doctrine of the Church of Rome, and adducing authorities in support of the new application. The obligation was signed in March, 1638, under circumstances too well known to be recapitulated.¹

Johnston, although from his secondary rank he did not then assume the authority of a leader, was, from his knowledge and perseverance, more trusted to in the labours of the opposition than any other man, and his name continually recurs as the agent in every active measure. To the unyielding and exasperating proclamation which was read at the market-cross of Edinburgh on the 22d of February, 1638, he prepared and read aloud, on a scaffold erected for the purpose, the celebrated protestation in name of the Tables, while the dense crowd who stood around prevented the issuers of the proclamation from departing before they heard the answer to

¹ For such matters connected with this period as are here, to prevent repetition, but slightly alluded to, see the memoirs of HENDERSON, of MONTROSE, and of the first DUKE OF HAMILTON, in this collection.

their challenge. On the 8th of July the king issued another proclamation, which though termed "A proclamation of favour and grace," and though it promised a maintenance of the religion *presently professed within the kingdom*, without innovation, an interim suspension of the service-book, a rectification of the high-commission, and the loudly called for General Assembly and parliament, was, with reason, deemed more dangerous than a defiance. Johnston had a protestation prepared for the delicacy of this trying occasion, which, with the decorum from which he seems on no occasion to have departed, he, "in all humility, with submissive reverence," presented in presence of the multitude.¹ When, on the 22d of September, the parliament and General Assembly were proclaimed, he prepared another protestation in a similar tone to the former, which he read in his own name, and in that of the Earl of Montrose, for the nobles; Gibson younger of Durie for the barons; George Porterfield, merchant in Glasgow, for the burghs; and Henry Pollock, minister of Edinburgh, for the clergy. It will be easily conjectured that, at the period when he was thus publicly employed, Johnston was privately acting as a partisan of the covenant, and an enemy of Prelacy and arbitrary power, by all the means which a political agent invariably uses. At such a period the more we can trace the private proceedings and feelings of the public man the better can we hold him up as a biographical example. As the only curious document connected with our subject at this period of his existence, we give the following somewhat mutilated letter to Johnston, from a person who did not choose to sign his name; it is characteristic of the feeling of the party, and of the occupation of the subject of our memoir; and if to a speculative politician it may breathe an illiberal spirit, let him remember that there never existed a party, however pure, which did not wish to suppress the opposite party, and that not having power and numbers on their side, the opponents of the covenant were in the situation of disturbers of society, in as far as they wished to impose rules on the whole kingdom.

"For Mr. Archibald Johnston of Warriston, advocate.

"Dear Christian Brother and courageous Protestant—Upon some rumour of the Prelate of St. Andrews his coming over the water, and finding it altogether inconvenient that he or any of that kynd should show themselves peaceably in publicke, some course was taken how hee might be enterreynt in such places as he should come unto: we are now informed that hee (will) not come, but that Broughen is in Edinburgh or thereabout; it is the advyce of your friends here, that in a private way some course may be taken for his terror and disgrace if he offer to show himself in publick. Think upon the best r . . . by the advyce of your friends there. I fear that their publick appearance at Glasgow shall be prejudicial to our cause. We are going to take order (with) his cheefe supporters there, Glaidstanes, Skryngmoor, and Hallyburton.

"Wishing you both protection and direction from your maister, I continew, youre owne whome you know. G.

"28th October, 1638."²

Such was the feeling in which the leaders of the covenant prepared themselves for the renowned General Assembly held at Glasgow in November and December, 1638. On that occasion Johnston was, by a unanimous vote, chosen clerk of the assembly. On its being discovered that his precursor had been enabled to procure only two of the seven volumes of minutes of the General Assemblies held since the Reformation, the moderator, probably in pursuance of a preconceived measure, called upon all those who were aware of the existence of any others to give information on the subject to the assembly. Johnston hereupon produced the other five volumes—how obtained by him we know not—

by which service he greatly increased the confidence previously placed in him. On the day before the session terminated the assembly elected him procurator for the church, and, as was afterwards ratified by act of parliament, he received for the former of these offices 500, and for the latter 1000 merks yearly.³

Johnston was one of the commissioners appointed by the Scots to conduct the treaty at Berwick. The General Assembly, which was the consequence of that pacification, passes over, and the unsatisfactory parliament which followed is commenced, ere we again observe Johnston's name connected with any public affairs beyond the usual routine of his duties. The parliament commenced its sittings on the 31st of August, 1639. On the 14th of November Sir Thomas Hope, in his official capacity as lord-advocate, produced a warrant from the king addressed to the commissioners, which, on the ground that the royal prerogative was interested in the proceedings, ordered a prorogation to the 2d of June, 1640. The warrant was read by Sir Alexander Gibson of Durie, one of the clerks of session, on which the lord-advocate took the usual protest, calling on the clerk actually to dissolve the meeting. On this the clerk, who was performing an unpleasing office, answered "that he had already read the said warrant containing the said prorogation, and was ready to read the same as oft as he should be commanded, but could not otherwise prorogate the parliament." The Earl of Rothes added to his embarrassment, by challenging him to "do nothing but as he would be answerable to the parliament, upon payne of his life." And the junior clerk, Mr. William Scott, being called on to dissolve the meeting, sagaciously declined officiating in the presence of his senior. Johnston then came forward, and, in name of the three estates, read a declaration purporting that his majesty, having, in compliance with the wish of his faithful subjects, called a free assembly and parliament, and submitted matters ecclesiastical to the former, and matters civil to the latter; the commissioner had (it was presumed, without the full permission of the king, attempted to dissolve the parliament—a measure which the estates maintained could not be constitutionally taken without the consent of the parliament itself. With that respect for the person of the king which, as the advocates of peaceful measures, the Covenanters at that period always professed to maintain, the document proceeds to state that the estates are constrained to the measure they adopt by "our zeal to acquit ourself according to our place, both to the king's majesty, whose honour at all times, but especially convened in parliament, we ought to have in high estimation, and to the kingdom which we represent, and whose liberties shall never be prostituted or vilified by us." Having denounced the prorogation as unconstitutional, this remarkable state-paper thus proceeds—"But because we know that the eyes of the world ar upon us, that declarations have been made and published against us, and malice is prompted for hir obloquies, and wateth on with opin mouth to snatch at the smallest shadow of disobedience, disservice, or disrespect to his majesty's commandments, that our proceedings may be made odious to such as know not the way how thes commandments are procured from his majesty, nor how they are made knowin and intimat to us, and doe also little consider that we are not now private subjects bot a sitting parliament, quhat national prejudices we have sustenit in tyme past by misinformation, and quhat is the present state of the

kingdom;" so arguing, the presenters of the declaration, that they may put far from them "all shaw or appearance of what may give his majesty the least discontent," resolve, in the meantime, merely to vindicate their rights by their declaration, and, voluntarily adjourning, resolve to elect some of each estate, as a permanent committee, endowed with the full powers of a parliamentary committee, to "await his majesty's gracious answer to our humble and just demands, and farther to remonstrate our humble desires to his majesty upon all occasions; that hereby it may be made most manifest, against all contradiction, that it was never our intention to deny his majesty any parte of the civil and temporal obedience which is due to all kings from their subjects, and from us to our dread soverane after a special maner, bot meerlie to preserve our religion, and the liberties of the kingdome, without which religion cannot continue long in safetie."—"And if it sall happen," continues this prophetic declaration "(which God forbid), that, efter we have made our remonstrances, and to the uttermost of our power and duetie used all lawful meanes for his majesty's information, that our malicious enemies, who are not considerable, sall, by their suggestions and lyes, prevail against the informations and generall declarations of a whole kingdom, we tak God and men to witness, that we are free of the outrages and insolencies that may be committed in the mean tyme, and that it sall be to us no imputation, that we are constrained to tak such course as may best secure the kirk and kingdome from the extremitie of confusion and miserie."

It is to be remarked that this act of the Covenanters did not assume the authority of a protest; it was a statement of grievances to which, for a short time, they would submit, supplicating a remedy. The assertion that the crown had not the sole power of proroguing parliament may be said to be an infringement of prerogative; but this very convenient term must owe its application to practice, and it appears that the royal power on this point had not been accurately fixed by the constitution of the Scottish parliament. The choice of the lords of articles by the commissioner—a step so far a breach of "privilege" (the opposite term to prerogative), that it rendered a parliament useless as an independent body—was likewise remonstrated against, along with the application of supplies without consent of parliament.

The Earls of Dunfermline and Loudon were sent as commissioners to represent the declaration to the king. "They behaved themselves," says Clarendon, "in all respects, with the confidence of men employed by a foreign state, refused to give any account but to the king himself; and even to the king himself gave no other reason for what was done, but the authority of the doers, and the necessity that required it; that is, that they thought it necessary; but then they polished their sturdy behaviour with all the professions of submission and duty which their language could afford."

As connected with this mission, some historians have alluded to, and others have narrated, a dark intrigue, of which Johnston was the negative instrument; a matter which has never been cleared up. We shall give it in the words of Burnet, the nephew of Johnston, and who had therefore some reason to know the facts. "After the first pacification, upon the new disputes that arose, when the Earls of Loudoun and Dumfermling were sent up with the petition from the Covenanters, the Lord Saville came to them, and informed them of many particulars, by which they saw the king was highly

irritated against them. He took great pains to persuade them to come with their army into England. They very unwillingly hearkened to that proposition, and looked on it as a design from the court to ensnare them, making the Scots invade England, by which this nation might have been provoked to assist the king to conquer Scotland. It is true, he hated the Earl of Strafford so much, that they saw no cause to suspect him; so they entered into a treaty with him about it. The Lord Saville assured them, he spoke to them in the name of the most considerable men in England, and he showed them an engagement under their hands to join with them if they would come into England, and refuse any treaty but what should be confirmed by a parliament of England. They desired leave to send this paper into Scotland, to which, after much seeming difficulty, he consented; so a cane was hollowed, and this was put within it; and one Frost, afterwards secretary to the committee of both kingdoms, was sent down with it as a poor traveller. It was to be communicated only to three persons—the Earls of Rothes and Argyle, and to Warriston, the three chief confidants of the Covenanters. . . . To these three only this paper was to be showed, upon an oath of secrecy; and it was to be deposited in Warriston's hands. They were only allowed to publish to the nation that they were sure of a very great and unexpected assistance, which, though it was to be kept secret, would appear in due time. This they published; and it was looked on as an artifice to draw in the nation; but it was afterwards found to be a cheat indeed, but a cheat of Lord Saville's, who had forged all those subscriptions. . . . The Lord Saville's forgery came to be discovered. The king knew it; and yet he was brought afterwards to trust him, and to advance him to be Earl of Sussex. The king pressed my uncle (Johnston) to deliver him the letter, who excused himself upon his oath; and not knowing what use might be made of it he cut out every subscription, and sent it to the person for whom it was forged. The imitation was so exact, that every man as soon as he saw his hand simply by itself, acknowledged that he could not have denied it."¹ Burnet had certainly the best opportunities for both a public and private acquaintance with such an event, and the circumstance has been at least hinted at by others; but Mr. Laing justly remarks that "in their conferences with these noblemen, and with Pym and Hambden, the Scottish commissioners during their residence in London must have received such secret assurances of support, that, without this forged invitation, the committee of estates would have chosen to transfer the war into England."²

At the parliament which met on the 2d of June, 1640, the representative of majesty in that body choosing to absent himself, or dreading the danger of a journey to Scotland, the estates proceeded to reduce themselves to a formal and deliberative body by the choice of a president. To this convention Johnston produced a petition from the General Assembly, which had been ratified by the privy-council, praying for a legislative ratification of the covenant, and an order that it should be enforced on the inhabitants of the country with all civil pains,³ —a requisition which the convention was not in a disposition to refuse. On the 11th of June, by the 34th act of this parliament, the celebrated committee of forty having, in absence of the superior body which called it into existence, the full legislative power of a republican congress, was elected, and the members

¹ Burnet, 37, 39, 41. ² Laing, iii. 194. ³ Act. Parl. v. 293.

were divided betwixt the camp and Edinburgh. Our surprise that so influential and laborious a man as Johnston was not chosen a member of this body is relieved by the place of higher, though somewhat anomalous, trust to which we find him appointed, as general agent and adviser to the body—a sort of leader without being a constituent member. “And because,” says the act, “there will fall out in the camp a necessitie either of treatties, consultations, or public declarations, to schaw the reasons of the demands and proceedings in the assemble and parliament, and the prejudices agains either of them, the estates ordayne Mr. Archibald Johnston, procurator for the kirk, as best acquaint with these reasons and prejudices, to attend his excellence (the general) and to be present at all occasions with the said committee, for their farther information, and clearing thairant.”¹ Johnston was one of the eight individuals appointed to treat with the English commissioners at Ripon, by an act of the great committee of management, dated the 30th of September, 1640.² When this treaty was transferred to London, Johnston was chosen a member of the committee, along with Henderson, as supernumeraries to those appointed from the estates, and probably with the peculiar duty of watching over the interests of the church, “because many things may occur concerning the church and assemblies thereof.”³

The proceedings and achievements of this body are so well known that, in an article which aims at giving such memorials of its subject as are not to be readily met with in the popular histories, they need not be repeated. On the 25th day of September, 1641, Johnston produced in parliament a petition that he might be exonerated from all responsibility as to the public measures with which he had for the previous four years been connected, mentioning the important office which he held as adviser to the commissioners attending on the motions at the camp, and the duties he was called on to perform at the treaty of Ripon and London; and observing, that it has been considered necessary that others so employed should have their conduct publicly examined in parliament, he craves that all requisite inquiry may immediately be made as to his own proceedings; that, if he has done anything “contrair to their instructions, or prejudicial to the publick, he may undergoe that censure which the wrongers of the countrey and abusers of such great trust deserves;” but if it has been found that he has done his duty, “then,” he says, “doe I in all humility begg that, seeing by God’s assistance and blessing the treattie of peace is closed, and seeing my employment in thir publick business is now at an end, that before I returne to my private affaires and calling, from the which these four yeires I have been continually distracted, I may obtaine from his gracious majesty and your lordships an exoneration of that charge, and an approbation of my former carriage.” The exoneration was granted, and the act ratifying it stated, that after due examination, the estates found that Johnston had “faithfullie, diligientlie, and cairfullie behaved himself in the foresaid charge, employments, and trust put upon him, in all the passages thairrof, as he justly deserves thair treu testimonie of his approven fidelitie and diligence.”⁴

In 1641, when the king paid his pacificatory visit to Scotland, Johnston obtained, among others, a liberal peace-offering. He had fixed his eyes on the office of lord-register, probably as bearing an affinity to his previous occupations; but the superior influ-

ence of Gibson of Durie prevailed in competition for that situation; he received, however, the commission of an ordinary lord of session, along with a liberal pension, and the honours of knighthood. During the sitting of the parliament we find him appointed as a commissioner, to treat with the king on the supplementary matters which were not concluded at the treaty of Ripon, and to obtain the royal consent to the acts passed during the session. Much about the same period he was appointed, along with others, to make search among the records contained in the castle, for points of accusation against the “incendiaries;” the persons whom he and his colleagues had just displaced in the offices of state and judicature. It may be sufficient, and will save repetition, to mention that we find him appointed in the same capacity which we have already mentioned, in the recommissions of the committee of estates, and in the other committees chosen to negotiate with the king, similar to those we have already described, among which may be noticed the somewhat menacing committee of 1641, appointed to treat as to commerce, the naturalization of subjects, the demands as to war with foreigners, the Irish rebellion, and particularly as to “the brotherlie supplie and assistance” of the English parliament to the Scottish army.⁵

In the parliament of 1643 Sir Archibald Johnston represented the county of Edinburgh, and was appointed to the novel situation of speaker to the barons, as a separate estate. In this capacity, on the 7th of June, 1644, he moved the house to take order concerning the “unnatural rebellion” of Montrose,⁶ and somewhat in the manner of an impeachment he moved a remonstrance against the Earl of Carnwath, followed by a commission to make trial of his conduct, along with that of Traquair, of which Johnston was a member.⁷ During the period when, as a matter of policy, the Scots in general suspended their judgment between the contending parties in England, Warriston seems early to have felt, and not to have concealed, a predilection for the cause of the parliament, and was the person who moved that the General Assembly should throw the weight of their opinion into that scale.⁸

Johnston had been named as one of the commissioners, chosen on the 9th August, 1643, for the alleged purpose of mediating betwixt Charles I. and his parliament; but Charles, viewing him as a dangerous opponent, objected to providing him with a safe-conduct, and he appears to have remained in

⁴ A curious evidence of his opinions, and the motives of his political conduct at this period, exists, in the form of some remarks on the aspect of the times, which appear to have been addressed to his friend Lord Loudon. The manuscript is in scroll, very irregularly written, and with numerous corrections; circumstances which will account for any unintelligibility in the portion we extract. It bears date the 21st of June, 1642. “Seeing thir kingdoms most stand and fall together, and that at the first design in all thir late troubles, so the last effort of thes evil counsels prevailing stit to the suppression of religion and liberty and the erection of poperye and arbitrary power; it is earnestly desyrd by good Christians and patriots that the question of the war be right stated, as a warr for religion and libertie, against papists and prelates, and their abackers and adherents; and that now, in thair straits and difficulties, they might enter in a covenant with God and amongst themselves, for the reformation of the church, abolishing of popery and prelaycy out of England and Scotland, and preservation of the roule and peace of thir kyngdoms, &c. without diminution of his majesty’s authorities, might not only free them of fears from this, but also fill them with hopes of their bearing alongst with their proceedings the hearts and confidence of thir kyngdoms. Pitmaylie may remember weal what of this kynd was motioned at Rippon, and spoken of agayne, when the English armye was reported to be comyng up.”—Wodrow’s *Papers*, Ad. Lib. vol. lxvi.

⁴ *Act. Parl.* v. 414.

Edinburgh. He, however, conducted a correspondence with the commissioners who repaired to London, as a portion of which, the subjoined letter to him from the Earl of Loudon, which throws some light on the policy of the Scots at that juncture, may be interesting.¹

We find Johnston sent to London on the 4th of July, 1644, but it is probable that, before that time, he had managed to visit England without the ceremonial of a safe-guard from the falling monarchy; and on the 9th of January, 1645, we find him along with Mr. Robert Barclay, "two of our commissioners lattle returned from London," reporting the progress of their proceedings to the house.² The proceedings of this commission, and of the assembly of

divines at Westminster, with which Warriston had a distinguished connection, may be passed over as matters of general history. Warned, probably, by the cautious intimations of the letter we have just quoted, Johnston was the constant attendant of the English commissioners on their progress to Scotland, and was the person who moved their business in the house.³ On the death of Sir Thomas Hope, in 1646, Johnston had the influence to succeed him as lord-advocate, an office for which he seems to have adapted himself by his numerous motions against malignants. With a firm adherence to his previous political conduct, Johnston refused accession to the well-known engagement which the Duke of Hamilton conducted as a last effort in behalf of the unfortunate monarch.

On the 10th of January, 1649, the Marquis of Argyre delivered a speech, "wich he called the breking of the malignants' teith, and that he quho was to speake after him (viz. Warriston) wolde brecke their jawes." Argyre found the teeth to be five, which he smashed one by one:—"His first was against the ingagers being statesmen, and intrusted with great places, quho had broken their trust. 2. Against the engagers' committee-men, quho by ther tyranny had opprest the subjects. 3. Against declared malignants, formerly fyned in parliament, or remitted, and now agayne relapsed. 4. Against thesesse that wer eager promoters of the laitt ingagemet with England. 5. Against suche as had petitioned for the advancement of the levey." After these were demolished, Johnston commenced his attack on the toothless jaws; he "read a speache two houres in lenthe off his papers, being an explanatione of Argyre's five heads, or teith, as he named them; with the anssuering of such objects he thought the pryme ingagers wolde make in their awen defence against the housse now convened, wich they did not acnounge to be a lawfull parliament."⁴

On the 6th of January, the imminent danger of the king prompted the choosing a committee to act for his safety under instructions. The instructions were fourteen; and the most remarkable and essential was, that a protest should be taken against any sentence pronounced against the king. "That this kingdom may be free of all the desollatione, misery, and bloodshed, that incertable will follow thereupone, without offering in your ressonne, that princes ar eximed from triall of justice."⁵ This was by no means in opposition to the principles which Johnston had previously professed, but his mind appears to have been finally settled into a deep opposition to all monarchy. Along with Argyre he distinguished himself in opposing the instructions by a method not honourable to their memory—a proposition that the measure should be delayed for a few days to permit a fast to be held in the interim. One of the last of his ministerial acts as lord-advocate was the proclamation of Charles II. on the 5th of February, 1649; and he was, on the 10th of March in the same year, appointed to his long-looked-for post of lord-register, in place of Gibson of Durie, superseded by the act of classes. At the battle of Dunbar in 1650 he was one of the committee of the estates appointed to superintend the military motions of Leslie, and was urgent in pressing the measure which is reputed to have lost the day to the Scots. He was naturally accused of treachery, but the charge has not been supported. "Waristoun," says Burnet, "was too hot, and Lesley was too cold, and yielded too easily to their humours, which he ought not to have done;"⁶

¹ "My Lord,—The sending of commissioners from the parliament here to the parliament of Scotland at this time was upon the sudden moved in the House of Commons (befoir wee wer acquainted thereof) by the solicitor, and seconded by some who profes to be o' freinds, as a greater testimonie of respect than the sending of a letter alone, and was in that sens approved by the whole hous, who, I believe, does it for no other end, neither is ther any other instructions given by the house than these, whereof the copy is sent to you, which ar only general for a good correspondence betwixt the two kingdoms. Bot I cannot forbear to tell you my apprehensions, that the intention and designs of some particular persons in sending down at this time, and in such a juncture of affaires (when ther is so great rumor of division and factiones in Scotland), is by them to learne the posture of business ther in the parl^t, assemblies, and kingdom, that they may receive privat information from them, and make ther applications and uses thereof accordingly. That which confirms this opinion to me the more, is, that the sending of these perones to Scotland was moved and seconded by such as profes themselves to be o' freinds w^out giving us any notice thereof till it was done; and the day before it was motioned, they and yo' old friend Sir Henry Vaine, younger, wer at a consultation together, and yo' lo^p: knows how much power Sir Henrie Vain has with Sir W^m Armyne and Mr. Bowlls.* Sir William Armyne is a very honest gentleman, but Mr. Bowlls is very deserving, and doubtless is sent (thoghe not of intention of the parl^t) as a spy to give privat intelligence to some who are jealous and curious to understand how all affairs goe in Scotland. Thomsone I hear is a Independent, and (if he goe not away before I can meit with some freinds) I shall c^otryve that there may be a snare laid in his gaitt to stay his journey; they wold be used with all civillie when they come, bot yo' lo^p: and others wold be verie wary and circumspect in all yo' proceedings and deallings wth them; seeing the hous of parl^t and all such heir as desyre a happie and well-grounded peace, or a short and prosperous warre, ar desyrus that the Scottish armie advance southward (although I dare not presume to give any positive judgment without presyene knowledge of the condition and posture of o' own kingdom). I cannot see any human means so probable and lyklye to settle religion and peace, and make o' nation the more considerable, as the advancing of o' armie southward if the turbulent comotions and rud distractions of Scotland may permitt, nor is it possible that so great an armie can be longer entertained by the northern counties, so barren and much waisted with armies; nor can it be expected that the parl^t of England can be at so great charge as the entertainment of that armie (if they did realleie intertain them), unless they be more useful for the caus and publick service of both kingdoms than to lye still in thes northern counties, being now reduced, and the king to vexe the south with forces equal to theirs; bot there needs not arguments to prove this point, unless that base crewe of Irish rebels and their perfidious confederates, and the unnatural factions of o' countrymen forgetting o' covenant, ar grown to such a hight of mischief and misery, as to make such a rent at home as to disable us to assist o' freinds, and prosecute that cause which I am confident God will carrie on and perfyte against all opposition; and in confidence thereof I shall encourage myself, and rejoyce under hope, although I should never sie the end of itt. I beseeche you to haist back this bearer, and let me know with him the condition of affairs in Scotland; how o' good freinds are, and how soon we may expect yo' returne hither, or if I must come to you befoir ye come to us. I refer the Marquiss of Argyre and my Lord Balmerinoch, and other freinds to you for intelligence, to spair paines and supply the want of leasure; and will say noe more at this time, bot that I am your most affectionate and faithfull friend, LOUPOUNE."—Wodrow's *M.S. Collection*, vol. lxxi. The letter is dated from Worcester House, January 6, 1644.

and the mistake may be attributed to the obstinacy of those who, great in the cabinet and conventicle, thought they must be equally great in war.

Warriston was among the few persons who in the committee of estates refused to accede to the treaty of Charles II. at Breda; an act of stubborn consistency which, joined to others of a like nature, sealed his doom in the royal heart. After the battle of Dunbar, the repeal of the act of classes, which was found necessary as a means of re-constructing the army, again called forth his jaw-breaking powers. He wrote "a most solid letter" on the subject to the meeting held at St. Andrews, July 18, 1651, which appears never to have been read, but which has been preserved by the careful Wodrow,¹ for the benefit of posterity. He wrote several short treatises on *The Sinfulness of Joining Malignants*, assailing their arguments in a very considerate and logical manner. One of these is extant, and lays down its aim as follows:

"The first question concerning the sinfulness of the publick resolutions hath bene handled in a former tractat. The other question remaines, anent y^e sinfulness and unlawfulness of the concurrence of particular persons." The question is proposed in the following terms:—"viz^t, when God's covenanted people intrusts God's covenanted interest to the power of God's anti-covenanted enemies, though upon pretence to fight against ane other anti-covenanted enemy—whether a consciensious covenant can lawfullie concur with such a partie in such a cause, or may lawfullie abstane, and rather give testimonie by suffering against both parties and causes, as sinfull and prejudiciall to God's honour and interest. It is presupposed a dutie to oppose the common enemy. The question is anent the meanes of resisting the unjust invader."

"Three things premittid. 1. The clearing of terms. 2. Some distinctions. 3. Some conjunctions handled."² The postulates are, perhaps, rather too sweeping for general opinion, but, presuming them to be granted, the reasonings of this lay divine are certainly sufficiently logical within their narrow space, and may have appeared as mathematical demonstrations to those who admitted the deep sin of accepting assistance from opponents in religious opinion. This resistance appears, however, to have been of a negative nature, and not to have extended to the full extremity of the remonstrance of the west; at least when called on for an explanation by the committee of estates, he declined owning connection with it: "Warreston did grant that he did see it, was at the voting of it, but refused to give his votte therin. He denyed that he wes accessorie to the contriving of it at first."³

After this period he appears to have been for some time sick of the fierce politics in which he had been so long engaged, and to have retired himself into the bosom of a large family. He is accused by a contemporary—not of much credit—of peculation, in having accepted sums of money for the disposal of offices under him; and the same person in the same page states the improbable circumstance of his having restored the money so gained, on all the offices being abolished by Cromwell, and that he was not affluent, having "conquest no lands but Warriston,⁴ of the avail of 1000 merks Scots a year, where he now lives freed of trouble of state or country."⁵

He was a member of the committee of protestors

who, in 1657, proceeded to London to lay their complaints before the government. Cromwell knew the value of the man he had before him, and persuaded him to try the path of ambition under the new government. Wodrow and others have found it convenient to palliate his departure from the adherence to royalty as an act for which it was necessary to find apologies in strong calls of interest and facility of temper. It will, however, almost require a belief in all the mysteries of divine right to discover why *Warriston* should have adhered to royalty without power, and how the opinions he always professed should have made him prefer a factious support of an absent prince to the service of a powerful leader, his early friend and coadjutor in opposing hereditary loyalty.

On the 9th of July, 1657, he was re-appointed clerk-register, and on the 3d of November in the same year he was named as one of the commissioners for the administration of justice in Scotland.⁶ Cromwell created Johnston a peer, and he sat in the protector's upper house with the title of Lord Warriston, occupying a station more brilliant, but not so exalted as those he had previously filled. After the death of Cromwell, Warriston displayed his strong opposition to the return of royalty, by acting as president of the committee of safety under Richard Cromwell. Knowing himself to be marked out for destruction, he fled at the Restoration to France. It is painful, after viewing a life spent with honour and courage in the highest trusts, to trace this great man's life to an end which casts a blot on the times and on the human race. He was charged to appear before the Estates; and having been outlawed in the usual form, on the 10th October, 1661, a reward of 5000 merks was offered for his apprehension. By a fiction of law, the most horrible which a weak government ever invented for protection against powerful subjects—but which, it must be acknowledged, was put in force by Warriston and his confederates against Montrose—an act of forfeiture in absence was passed against him, and he was condemned to death on the 15th of May, 1661. The principal and avowed articles of accusation against him were, his official prosecution of the royalists, and particularly of Gordon of Newton, his connection with the Remonstrance, his sitting in parliament as a peer of England, and his accepting office under Cromwell.

It was necessary that the victim of judicial vengeance should be accused of acts which the law knows as crimes; and acts to which the best protectors of Charles II.'s throne were accessory were urged against this man. For the hidden causes of his prosecution we must, however, look to his ambition, the influence of his worth and talents, and the unbending consistency of his political principles; causes to which Wodrow has added his too ungracious censure of regal vice.

In the meantime Johnston had been lurking in Germany and the Low Countries, from which, unfortunately for himself, he proceeded to France. A confidant termed "Major Johnston" is supposed to have discovered his retreat; and a spy of the name of Alexander Murray, commonly called "Crooked Murray," was employed to hunt him out. This individual, narrowly watching the motions of Lady Warriston, discovered his dwelling in Rouen, and with consent of the council of France he was brought prisoner to England, and lodged in the Tower on the 8th of June, 1663; thence he was brought to Edinburgh, not for the purpose of being tried, but to suffer execution of the sentence passed on him in

absence. When presented to parliament to receive sentence, it was apparent that age, hardship, and danger had done their work effectually on his iron nerves; and the intrepid advocate of the covenant exhibited the mental imbecility of an idiot. His friends accused Dr. Bates of having administered to him deleterious drugs, and weakened him by bleeding; an improbable act, which would have only raised unnecessary indignation against those who already had him sufficiently in their power. The apostate Sharpe and his other enemies are said to have ridiculed the sick lion;¹ but there were at least a few of his opponents not too hardened to pity the wreck of a great intellect before them.

Probably affected by the circumstances of his situation, some of the members showed an anxiety for a little delay; but Lauderdale, who had received imperative instructions regarding him, fiercely opposed the proposition. He was sentenced to be hanged at the cross of Edinburgh on the 22d of July, his head being to be severed from his body, and placed beside that of his departed brother in the cause, Guthrie. Of the mournful pageant we extract the following characteristic account from Wodrow:—

"The day of his execution, a high gallows or gibbet was set up at the cross, and a scaffold made by it. About two o'clock he was taken from prison; many of his friends attended him in mourning. When he came out he was full of holy cheerfulness and courage, and in as perfect serenity and composure of mind as ever he was. Upon the scaffold he acknowledged his compliance with the English, and cleared himself of the least share of the king's death. He read his speech with an audible voice, first at the north side and then at the south side of the scaffold: he prayed next, with the greatest liberty, fervour, and sense of his own unworthiness, frequently using the foresaid expression. After he had taken his leave of his friends, he prayed again in a perfect rapture, being now near the end of that sweet work he had been so much employed about through his life, and felt so much sweetness in. Then the napkin being tied upon his head, he tried how it would fit him, and come down and cover his face, and directed to the method how it should be brought down when he gave the sign. When he was got to the top of the ladder, to which he was helped because of bodily weakness, he cried with a loud voice, 'I beseech you all who are the people of God, not to scar [be scared] at sufferings for the interests of Christ, or stumble at anything of this kind falling out in those days; but be encouraged to suffer for him; for I assure you, in

the name of the Lord, he will bear your charges.' This he repeated again with great fervour while the rope was tying about his neck, adding, 'The Lord hath graciously comforted me.' Then he asked the executioner if he was ready to do his office, who answering he was, he bid him do it, and crying out, 'O pray, pray! praise, praise!' was turned over, and died almost without a struggle, with his hands lifted up to heaven."²

The same partial hand has thus drawn his character: "My Lord Warristoun was a man of great learning and eloquence; of very much wisdom, and extraordinary zeal for the public cause of religion and reformation, in which he was a chief actor; but above all, he was extraordinary in piety and devotion, as to which he had scarce any equal in the age he lived in. One who was his intimate acquaintance says, he spent more time, notwithstanding the great throng of public business upon his hand, in prayer, meditation, and close observation of providences, and self-examination, than ever he knew or heard of: and as he was very diligent in making observations on the Lord's way, so he was visited with extraordinary discoveries of the Lord's mind, and very remarkable providences. He wrote a large diary, which yet remains in the hands of his relations; an invaluable treasure of Christian experiences and observations; and, as I am told by one who had the happiness to see some part of it, there is mixed in sometimes matters of fact very little known now, which would bring a great deal of light to the history of Scots affairs in that period wherein he lived."³

But his nephew, Burnet, has, in his usual characteristic manner, drawn a more happy picture of the stubborn statesman and hardy zealot, too vivid to be neglected: "Warristoun was my own uncle; he was a man of great application, could seldom sleep above three hours in the twenty-four: he had studied the law carefully, and had a great quickness of thought, with an extraordinary memory. He went into very high notions of lengthened devotions, in which he continued many hours a-day: he would often pray in his family two hours at a time, and had an unexhausted copiousness that way. What thought soever struck his fancy during these effusions, he looked on it as an answer of prayer, and was wholly determined by it. He looked on the covenant as the setting Christ on his throne, and so was out of measure zealous in it. He had no regard to the raising himself or his family, though he had thirteen children; but prosperity was to him more than all the world. He had a readiness and vehemence of speaking that made him very considerable in public assemblies; and he had a fruitful invention; so that he was at all times furnished with expedients."

JOHNSTON, DR. ARTHUR, a poet and physician, was born in the year 1587, at Caskieben, the seat of his family, a few miles from Aberdeen. He was the fifth son of George Johnston of that ilk and of Caskieben, the chief of the family of Johnston, by Christian Forbes, daughter of William, seventh Baron Forbes. He appears to have been named after his uncle the Honourable William Forbes of Logie, who was killed at Paris in the year 1574.⁴ This poet, whose chief characteristic was the elegance with which he expressed his own simple feelings as a poet, in the language appropriate to the customs and feelings of a past nation, has left in his *Epigrammata* an address to his native spot; and, although Caskie-

¹ One of these was M'Kenzie, who, with uncharitable and improbable inferences, draws the following graphic picture of the scene:—"He was brought up the street discovered [uncovered]; and being brought into the council-house of Edinburgh, where the chancellor and others waited to examine him, he fell upon his face roaring, and with tears entreated they would pity a poor creature who had forgot all that was in his Bible. This moved all the spectators with a deep melancholy; and the chancellor, reflecting upon the man's former esteem, and the great share he had in all the late revolutions, could not deny some tears to the frailty of silly mankind. At his examination he pretended that he had lost so much blood by the unskilfulness of his surgeons, that he lost his memory with his blood; and I really believe that his courage had indeed been drawn out with it. Within a few days he was brought before the parliament, where he discovered nothing but much weakness, running up and down upon his knees begging mercy. But the parliament ordained his former sentence to be put into execution, and accordingly he was executed at the cross of Edinburgh. At his execution he showed more composure than formerly, which his friends ascribed to God's miraculous kindness for him, but others thought that he had only formerly put on this disguise of madness to escape death in it, and that, finding the mask useless, he had returned, not to his wit, which he had lost, but from his madness, which he had counterfeited."

—Sir G. M'Kenzie's *Annals*, 134.

² Wodrow, i. 385.

³ Wodrow, i. 361. Much search has lately been made for this interesting document, but without success.

⁴ Johnston's *History of the Family of Johnston*, 36.

ben is a piece of very ordinary Scottish scenery, it is surprising how much he has made of it by the mere force of his own early associations. With the minuteness of an enthusiast, he does not omit the circumstance, that the hill of Benochie, a conical elevation about eight miles distant, casts its shadow over Caskieben at the periods of the equinox. As we shall be able, by giving this epigram, to unite a specimen of the happiest original efforts of the author's genius with circumstances personally connected with his history, we beg leave to extract it:—

Æmula Thessaliciæ en hic Jonstonia Tempe,
Hesperus hyperboreo fusa sub axe vides.
Mille per ambages nitidus argenteus undis,
Hic trepidat lætos Urinis inter agros.
Explicit hic seras ingens Bennachius umbras,
Nox ubi libratur lance desique pari.
Gemmifer est amnis, radiat mونس ipsæ lapilli,
Queis nihil Eous purius orbis habet.
Hic pandit natura sinum, nativæque surgens
Purpura felicem sub pede ditat humum.
Aëra per liquidum volucres, in flumine pisces,
Adspicias in pratis luxuriare pascuis.
Hic seges est, hic poma rubent, onerantur aristas
Arva, suas ægre sustinet arbor opes.
Propter aquas arx est, ipsi contermina cœlo,
Auctoris menti non tamen æqua sui.
Imperat hæc arvis et vectigalibus undis,
Et famula stadiis distat ab urbe tribus.
Hæc mihi terra parens: gens has Jonstonia lymphas,
Arvaque per centum missa tuetur avos.
Clara Maronæis evasit Mantua cunius;
Me mea natalis nobilitat humus.

TRANSLATION.

Here, traveller, a vale behold
As fair as Tempe, famed of old,
Beneath the northern sky!
Here Urie, with her silver waves,
Her banks, in verdure smiling, laves,
And winding wimplies by.
Here, towering high, Bennachie spreads
Around on all his evening shades,
When twilight gray comes on:
With sparkling gems the river glows:
As precious stones the mountain shows
As in the East are known.
Here nature spreads a bosom sweet,
And native dyes beneath the feet
Bedeck the joyous ground:
Sport in the liquid air the birds,
And fishes in the stream; the herds
In meadows wanton round.
Here ample barn-yards still are stored
With relics of last autumn's hoard
And firstlings of this year;
There waving fields of yellow corn,
And ruddy apples, that adorn
The bending boughs, appear.
Beside the stream, a castle proud
Rises amid the passing cloud,
And rules a wide domain
(Unequal to its lord's desert):
A village near with lowlier art,
Is built upon the plain.
Here was I born: o'er all the land
Around the Johnstons bear command,
Of high and ancient line:
Mantua acquired a noted name
As Virgil's birth-place; I my fame
Inherit shall from mine.

In a similar spirit he has left an epigram on the small burgh of Inverury, in the neighbourhood of Caskieben, in which he does not omit the circumstance, that the fuel of the inhabitants (vulgo, the peats) comes from the land in which he was born. A similar epigram to another neighbouring burgh, the royal burgh of Kintore, now holding the rank of a very small village, informs us that at the grammar-school of that place he commenced the classical studies which afterwards acquired for him so much eminence:

"Hic ego sum memini musarum factus alumnus,
Et tiro didici verba Latina loqui."

After leaving this humble seat of learning, he is said to have studied at Marischal College in Aberdeen; a circumstance extremely probable, but which seems to have no other direct foundation than the conjecture of Benson, from the vicinity of his paternal estate to that institution, and his having been afterwards elected rector of the university, an honour generally bestowed on illustrious alumni.¹

Johnston, intending to study medicine, a science which it would have been in vain at that period to have attempted in Scotland, proceeded to Rome, and afterwards to Padua, where he seems to have acquired some celebrity for the beauty of his earlier Latin poems, and took the degree of Doctor in Medicine.² He afterwards travelled through Germany, Holland, and Denmark, and finally fixed his abode in France. If he remained for a considerable period at Padua, he must have early finished his curriculum of study at Aberdeen, as he is said by Sir Thomas Urquhart to have been laureated a poet in Paris at the age of twenty-three.

He remained for twenty years in France, a period during which he was twice married, to ladies whose names are unknown, but who bore him thirteen children to transmit his name to posterity. On his return to Britain, about the year 1632, probably at the recommendation of Laud, who was his friend, and had commenced the career of court influence, Johnston was appointed physician to Charles I., a circumstance which must have preceded or immediately followed his arrival, as he styles himself in the first edition of his *Parerga* and *Epigrammata*, published at Aberdeen in 1632, "Medicus Regius." The *Parerga* consists, as its name may designate, of a variety of small pieces of poetry, which cannot be conveniently classed under a more distinct name. A few are satirical, but the lyrical (if they may be said to come correctly under that designation) form the most interesting portion. Johnston seldom indulges in the metaphoric brilliancy which characterized the native writers in the language which he chose to use; but he has a considerable portion of their elegance, while much of the poetry is founded on association and domestic feeling, of which he has some exquisitely beautiful traits, which would have been extremely pleasing had he used his vernacular tongue. He is said to have wished to imitate Virgil; but those who have elevated Buchanan to the title of the "Scottish Virgil," have designated Johnston the "Scottish Ovid;" a characteristic which may apply to the versification of his *Psalm*s, but is far from giving a correct idea of the spirit of his original pieces.

Benson mentions, that Johnston was a litigant in the Court of Session in Edinburgh at the period of his return to Britain; and probably the issue of his suit may account for a rather unceremonious attack in the *Parerga* on advocates and agents, unblushingly addressed "Ad duos rabulas forenses, Advocatum et Procuratorem," of whom, without any respect for the College of Justice, the author says,

"Magna minorque fere, quarum paria altera lires;
Altera dispensas, utraque digna mori," &c.

On approaching the period when Johnston published his translation of the *Psalm*s of David, we cannot help being struck with the circumstances under which he appears to have formed the design. Dr. Eaglesham had, in the year 1620, published a criticism of considerable length, for the purpose of

¹ Benson's "Life" prefixed to Johnston's *Psalm*s, vi.

² "Quod ex carmine manuscripto in Advocatorum Bibliotheca, Edinburgi servato, intelligimus." The circumstance is mentioned in Sir Robert Sibbald's *Bibliographia Scotica*, which though not a "carmen," may be the MS. referred to.

proving that the public voice had erred in the merit it allowed to Buchanan's version of the Psalms, and modestly displaying a translation of Psalm civ., of his own workmanship, between which and the psalms of Buchanan he challenged a comparison.¹ Dr. William Barclay penned a critical answer to this challenge,² and Johnston made a fierce stroke at the offender, in a satirical article in the *Parerga*, which he calls "Consilium Collegii Medici Parisiensis de Mania Hypermori Medicastri," commencing

"Que Buchananæis medicaster crimina misis
Obicit, et quo se jactat inane melos;
Vidimus: et quotquot tractamus Pæonias artes,
Hic vates, uno diximus ore, furit," &c.

Johnston, however, did not consider himself incapacitated to perform a work in which another had failed, and he, probably at that period, formed the resolution of writing a version of the Psalms, which he afterwards produced under the auspices, and with the advice, of his friend Laud, which he published at London and Aberdeen in 1637. No man ever committed a more imprudent act for his own fame; as he was doomed by the nature of his task, not only to equal, but to excel, one of the greatest poets in the world. His fame was not increased by the proceedings of his eccentric countryman Lauder, who many years afterwards endeavoured with a curious pertinacity to raise the fame of Johnston's version far above that of Buchanan. Mr. Auditor Benson, a man better known for his benevolence than his acuteness, was made the trumpet of Johnston's fame. This gentleman published three editions of Johnston's psalms; one of which, printed in 1741, and dedicated to Prince George, afterwards George III., is ornamented with a very fine portrait of the poet by Vertue after Jamesone, and is amply illustrated with notes. The zealous editor received as his reward from the literary world, a couplet in the *Dunciad*, in which, in allusion to his having procured the erection of the monument to the memory of Milton in Westminster Abbey, it is said,

"On two unequal crutches propt he came,
Milton's on this, on that one Johnston's name."

A late writer, considerably versed in classical and biblical criticism—Mr. Tennant—finds, that even after the luxuriant fervidness of Buchanan, there is much to admire in the calm tastefulness and religious feeling of Johnston, and that the work of the latter is not only a more faithful translation, but given in a manner better suited (in his opinion) to the strains of the holy minstrel, than that followed by the fiery genius of Buchanan, when restricted to translation. "He is not," remarks this author, "tempted like Buchanan, by his luxuriance of phraseology, and by the necessity of filling up, by some means or other, metrical stanzas of prescribed and inexorable length, to expatiate from the psalmist's simplicity, and weaken, by circumlocution, what he must needs beat out and expand. His diction is therefore more firm and nervous, and, though not absolutely Hebræan, makes a nearer approach to the unadorned energy of Jewry. Accordingly, all the sublime passages are read with more touching effect in his than in Buchanan's translation: he has many beautiful and even powerful lines, such as can scarce be matched by his more popular competitor; the style of Johnston possessing somewhat of Ovidian ease, accompanied with strength and simplicity, while the tragic pomp and worldly parade of Seneca and Prudentius are more affected by Buchanan."³

Let us conclude this subject with remarking the peculiar circumstance, that while Scotland has produced two Latin versions of the psalms, rivals in excellence, the talent of the whole nation has been unable to produce any English version which can be considered as their equal in point of versification. In 1641 Johnston died at Oxford, where he had gone on a visit to a daughter married to a divine of the Church of England. Besides the works already mentioned, he wrote *Muse Aulica*, addressed to his eminent contemporaries, translated Solomon's Song, the Creed, and the Lord's Prayer, and edited the *Delitæ Poetarum Scotorum*, in which he introduced not a few of his own productions. His works were published at Middleburg, in 1642, by his friend Scott of Scotstarvet. The representatives of his family are Sir William Johnston of Hilton in Aberdeenshire, and Mr. Johnston of Viewfield in the same county.

The brother of the poet was a man of some local celebrity; he was Dr. William Johnston, professor of mathematics in the Marischal College of Aberdeen. "He was," says Wodrow, "a learned and experienced physitian. He wrote on the mathematics. His skill in the Latin was truly Ciceronian."⁴

JOHNSTONE, MRS. CHRISTIAN ISOBEL. This talented literary lady and popular novelist was born in Fifeshire in 1781. When very young she married a Mr. McLeish, whom she was afterwards compelled to divorce. Her second and last husband was Mr. John Johnstone, schoolmaster at Dunfermline, to whom she was married about the year 1812. Having removed to Inverness, where Mr. Johnstone purchased the *Inverness Courier*, of which he also became editor, the literary talents of his wife so effectually aided him, that the paper soon acquired a character superior to that of most of our provincial journals. While residing in Inverness she also wrote *Clan Albyn, a National Tale*, which was published anonymously at Edinburgh in 1815, and obtained great popularity. Sir Walter Scott's novels were already bringing Scotland into vogue, and several writers were throwing themselves into the popular current; but of all the followers of the "Great Unknown," none was received with greater favour than Mrs. Johnstone. Although the memory of *Clan Albyn* is now extinguished in the public mind by the myriads of novels which have succeeded it, the recollections of the vigorous sketches in that work both of Highland and Lowland characters and scenery, and those of the disasters of Sir John Moore's campaign in Spain, are still fresh among many whose lives commenced with the present century. Having sold the *Inverness Courier*, Mrs. Johnstone removed with her husband to Edinburgh, where she was engaged by Mr. Blackwood the publisher to write another novel: in consequence she produced her *Elizabeth de Bruce*, a tale of which the locality and events are partly of Scottish and partly of Irish character. It was published in 1827, but although superior to *Clan Albyn*, it scarcely obtained the same popularity. Either the standard of the author of Waverley was too high, or his imitators too numerous, to insure success in such a kind of competition. It is only justice, however, to Mrs. Johnstone to add, that while the usual impression of a three-volumed novel was 500 copies, the publisher printed 2000 of *Elizabeth de Bruce*, and that of these about 1200 or 1400 copies were sold at the regular price.

⁴ *Catalogues of Scottish Writers*, published by Mr. Maidment, Edinburgh, 1833, p. 114.

Mrs. Johnstone and her husband being now committed to literature, embarked in it with hearty and mutual zeal; the latter opened a printing-office in St. James' Square, and Mr. Blackwood and Mr. Johnstone having purchased the copyright of the *Edinburgh Weekly Chronicle*, the printer and his talented wife became the joint editors of the newspaper. But while their views in politics were those of the liberal party, Mr. Blackwood was heart and soul with the Tories, which made a lasting co-proprietorship impossible; and in consequence of this incompatibility of temper, the union was dissolved, and the *Chronicle* sold. The Johnstones now threw themselves into other literary undertakings, the chief of which was the periodical called *The Schoolmaster*, supposed to have been the earliest series of our cheap literature in Edinburgh, the plan of which was first suggested by Mrs. Johnstone, and afterwards matured by her husband. As it was the first, it was also one of the best, of our Edinburgh cheap and popular literature, as none of its followers can be said to have surpassed the *Schoolmaster*. But it was too good to be highly popular: the importance of its articles and the talent with which they were discussed was "caviare to the multitude," while its cheap price repelled those readers who estimated the value of literature merely by the amount of its cost. On this account it was found necessary to merge the publication into *Johnstone's Magazine*, which was published monthly for a considerable period at eightpence. This new periodical, in which politics were almost wholly avoided, and subjects of literary and social interest chiefly discussed, promised to be successful, when a difficulty occurred: *Tait's Magazine* was also printed at St. James' Square office, and both magazines were issued by the same publisher. A compromise was the consequence, by which *Johnstone's Magazine* was absorbed into that of *Tait*, while the latter, still retaining the name of *Tait's Magazine*, was reduced from its monthly price of half-a-crown to a shilling. It was a satisfactory arrangement to both parties, while the popularity of the periodical in this new form was insured by the appointment of Mrs. Johnstone to be its chief contributor and director. Although she was nominally the editor, her authority was subject to the control of Mr. Tait, who still retained the principal management, and thus she acted the same part for *Tait's Magazine* that Wilson did for *Blackwood's*. After the accession of Mrs. Johnstone to *Tait's Magazine* it was inspired with new life, and rose rapidly in popularity, while this success was owing not so much to the political articles it contained, as to its elaborate, able, and just criticisms, which were written almost exclusively by Mrs. Johnstone. It may be remarked also, that although a just she was a gentle critic, and wherever true merit appeared in the subjects of her review, or the promise of future excellence, she was always careful, with feminine gentleness, to point out the one and encourage the other.

The next separate work published by Mrs. Johnstone after *Clan Albyn* and *Elizabeth de Bruce*, was *Lives and Voyages of Drake, Cavendish, and Dampier, including a History of the Buccaneers*. This work, which formed the fifth volume of the Edinburgh Cabinet Library, was published in 1831, and in the following year appeared her *Nights of the Round Table*, a punning title, in which were included a series of lively tales and sketches. This she always considered as the best of her works of fiction. But a still more popular work was the *Edinburgh Tales*, chiefly written by herself in the *Schoolmaster*, *Johnstone's Magazine*, and *Tait's Magazine*, and which

were now published with several contributions of other writers in a regular series, in weekly numbers and monthly parts, and which when finished composed three large volumes. These were so popular, that in their weekly and monthly form more than 30,000 copies were sold, while in their collective form they still obtained a considerable sale. Of these tales, by far the best are Mrs. Johnstone's own, while the largest of the series—*Violet Hamilton* and the *Western Exclusives*—are equal to her best productions. Few sketches, indeed, of Glasgow society at the beginning of the present century are at all to be compared with those contained in the *Western Exclusives*. The last and also the most popular of all her works which we have occasion to mention, bore the following well-known title, *The Cook and Housewife's Manual. A Practical System of Modern Domestic Cookery and Family Management*. By Mrs. Margaret Dodds, of the Cleikum Inn, St. Romans. It was written at the earlier period of her life in Inverness, and besides being lively and fanciful in style, with the principal epicures of Scott's *St. Ronan's Well* and other popular novels as the principal speakers and actors, the valuable directions and receipts contained in it made it the oracle of the kitchen, and *Meg Dodds' Cookery* became a household word. This combination indeed of the lively and witty with the wise and the practical, formed the chief attraction of the work; it was the new experiment of investing culinary operations with the charms of novel-writing; and even those who did not care for luxurious dinners were interested in the directions given for concocting them, and the alluring style in which these directions were conveyed. This singular volume was in such great demand, that in 1858 ten editions of it had appeared, and from the sale Mrs. Johnstone derived a regular revenue for the rest of her life.

While her popularity in the literary world was so great, and always increasing, "her manner of life," writes one of her biographers, "was that of a perfect gentlewoman. She might have easily obtained a greater name in the world if she had sought it. She sought it not. Even the good she did was often concealed from those for whom it was done. Many persons now occupy respectable positions in the world who are indebted exclusively to the plans of this gentlewoman—devised without solicitation, and untold when they were successful. . . . Whenever she thought that it was within her power to be useful to those with whom she had in any way become acquainted, however slightly, but so far as induced her to believe that their conduct would support her recommendation, she said nothing on the subject to them, but sought to accomplish her object. If she failed, no hopes had been erected to be cast down again; and if she succeeded, the success was seldom told by herself, and the originator of some change in life was not always known—perhaps in some cases never known—to him whose course of life was changed."

It is only necessary to add, that after 1846 Mrs. Johnstone's connection with *Tait's Magazine* ceased, and that she retired into private life with the competence which her industry had acquired. At length, full of years, honoured by society, and beloved by all who knew her, she died at Edinburgh on Aug. 26, 1857. Her affectionate husband, the director and often the partaker of her literary exertions, followed in a few months after, and over their grave in the Grange Cemetery stands an elegant obelisk with the following inscription: "Mrs. Christian Isobel Johnstone, died 26 August 1857, aged 76. John Johnstone, died 3 November following, aged 78. A memorial of literary excellence and private worth. Erected 1858."

JOHNSTON, GEORGE, M.D. This distinguished naturalist, and attractive writer in natural science, was born in 1798, but of what parentage we have seen no record. He was destined for the medical profession, and apprenticed to Dr. Abercrombie of Edinburgh, who, in his day, was one of the most eminent medical practitioners of Britain. Having gone through the usual medical education and practical training, George Johnston graduated in Edinburgh in 1819, and afterwards settled down in the general practice of his profession at Berwick-upon-Tweed. Having acquired a taste at Edinburgh for the study of natural history, it was so suited to his inquiring mind and refined poetical temperament that he continued to prosecute it till the end of his life; and although occupied with a laborious professional practice, which leaves small leisure or inclination for other pursuits, the works which he published in natural history have sufficed to establish his name among the most distinguished writers in that department.

At the time when Dr. Johnston first settled as a medical practitioner in Berwick-upon-Tweed, little was known of the lower forms of animal life, to which he devoted his attention; and thus, although he stood alone, he occupied a field in which his researches might go on without a rival, and which, by the right of pre-occupation, he could make his own for the time being. And nobly did he justify the advantages of such a starting-point. After he had established himself in Berwick, he proceeded to publish the results of his inquiries in the various natural history journals and the transactions of natural history societies. Thus his principal papers, indicating the wide range of his sympathy with natural objects, his remarkable powers of observation, and his sound and cautious judgment, appeared in the *Edinburgh Philosophical Journal*, the *Magazine of Natural History*, the *Annals of Natural History* (of which latterly he was one of the editors), the *Transactions of the Natural History Society of Newcastle*, and the *Proceedings of the Berwickshire Naturalists' Club*, of which he was one of the founders. But the work by which he was best known to the scientific world at large, and which perhaps will constitute the most lasting monument of his fame, was his *History of British Zoophytes*. Of this important work we see the original elements in his "Descriptive Catalogue of the Recent Zoophytes found on the Coast of Durham," which appeared in the second volume of the *Transactions of the Natural History Society of Newcastle-upon-Tyne*, and in his "Catalogue of the Zoophytes of Berwickshire," published in the *Proceedings of the Berwickshire Naturalists' Club*. His great original *History of British Zoophytes* was published first in Edinburgh in 1838, and afterwards a second edition of it was issued from the London press in 1847. The work was welcomed as by far the most complete and accurate account of the British forms of these animals we yet possessed; and to enhance its value, it was beautifully illustrated by Mrs. Johnston. But while employed upon the zoophytes, the sponges and corallines did not escape his notice, and in 1842 he published *A History of British Sponges and Lithophytes*. This work, like the previous one, is still the best and most complete in our language on the subject of which it treats; and the effect of both was to raise the reputation not only of the author, but the town in which he dwelt, so that Berwick, only distinguished as yet by its traditions of border warfare, had now become so notable in science, as to be scarcely second to Selborne. The subjects indeed which employed the pen of Dr. Johnston had not the same attractive and popular interest as those on which White of Selborne

had written; but his lively fancy and elegant pleasing style could impart to them a charm which elevated them from their dullness and apparent insignificance into objects of popular importance. Having devoted much of his attention to the mollusca, as appears from many of his papers on the subject, Dr. Johnston published in 1850 his *Introduction to Conchology, or Elements of the Natural History of Molluscan Animals*. This is a delightful literary performance, and full of interesting illustrations of the structure and habits of the shell-fishes of Great Britain.

Hitherto we have viewed this excellent naturalist ranging among zoophytes and lithophytes, crustacea and molluscs, and all the forms of invertebrate life. Wherever he went he observed; his professional visits were made with restless inquiring eye to whatever was interesting in the kingdom of nature; and even while standing upon the sea-shore, every object which the waves deposited upon the sand arrested his attention, and became a subject of study. To him the sea was a populous and living world, instead of a picturesque mass of water. "It is very true," he said, "that I have been a scholar for many years in the book of nature; and I have taught myself to take note of, and pleasure in, those works with which the Creator has crowded and adorned the paths I daily walk; and sure I am that now I can see and appreciate a beauty and excellence where otherwise they would not have impressed me." Such was his declaration in the preface to a new work entitled *Terra Lindisfarnensis*, of the first volume of which, *The Natural History of the Eastern Borders*, Dr. Johnston was the author. The field over which it ranged comprised the whole of Berwickshire, the liberties of Berwick, North Durham, and the immediately adjacent parts of Northumberland and Roxburghshire; and while the specific object of the volume was to describe the "botany" of that district, it was abundantly interspersed with anecdote and folk-lore, legend, poetry, and biography, local objects and scenery to interest every reader. To the active mind of its author, however, such a production was a recreation and relief from more severe studies, to which he returned with redoubled ardour. He had long been investigating the annelida, the true worms of the naturalist, but a greatly neglected branch of British zoology, and had written several papers on British annelides and Irish annelides, which were greatly admired, and had called the attention of naturalists to the subject. Thus encouraged to persevere, he had made preparations for writing a complete work on British annelides, when he was seized with paralysis, and died on the 3d of July, 1855.

The unexpected death of Dr. Johnston was lamented in the scientific world as no ordinary bereavement. To a mind untired in investigation, and which phenomena, however minute, could not escape, he added those powers of eloquence and charms of imagination which adorned whatever he touched, and invested the humblest objects of nature with new interest and beauty. He resembled indeed the lamented Hugh Millar, although in a different field of natural science. It was his observant eye that first detected the new water-weed (*Anacharis alsinastrum*) in the lake at Dunse Castle in 1838, and again in the waters of the Whiteadder in 1841. His interest in science was also manifested not only in his writings, but the societies with which he was connected. He was an active member, if not also the founder, of the Berwickshire Natural History Club, and one of the founders of the Ray Society for the publication of works on natural history, and was one of the

secretaries of the society till his death. With regard to his personal and private character, one of his biographers adds, "He was a man of the most genial and kindly disposition, and greatly beloved in the circle of naturalists by whom he was surrounded, and whom he often met in the Naturalists' Field Club he had established. He was well read in the literature of natural history, and nothing delighted him more than imparting his copious stores of information to others. His correspondence was extensive, and many a living naturalist is indebted to him for encouragement in the prosecution of his earliest labours." Such was the man who contributed so largely to the literature of the natural history of Great Britain, and who, although half-buried in a humble position and obscure border town, obtained so high and so wide a renown in the scientific world.

JOHNSTONE, JAMES, a physician of some eminence, was born at Annan in the year 1730. He was the fourth son of John Johnstone, Esq., of Gala-bank, one of the oldest branches of the family of that name. He received the rudiments of his classical education from Dr. Henry, the well-known author of the *History of Great Britain*. The science of medicine he studied first in Edinburgh and afterwards in Paris; and such was his progress in these studies, that he took the degree of Doctor of Medicine before he had completed his twenty-first year. On this occasion he published a thesis, *De Aeris Facilitate Imperio in Corpore Humano*, which discovered an ability that procured him many valuable friends. On completing his education, Dr. Johnstone commenced practice at Kidderminster, in Worcestershire, where he quickly acquired a great degree of celebrity by the successful manner in which he treated a peculiar epidemic, called, from its remarkable virulence in that locality, the Kidderminster fever. Of this fever, and his mode of treating it, he published an account in 1758, an exceedingly important treatise, from the circumstance of its pointing out the power of minerals and vapours to correct or destroy putrid febrile contagion. This discovery, now so frequently and successfully employed in arresting the progress of infection, and in purifying infected places, though since claimed by others, belongs beyond all doubt to Dr. Johnstone; who pointed out also the simple process by which it was to be effected—viz. by pouring a little vitriolic acid on common salt.

Dr. Johnstone was well known in the learned world by several interesting publications on subjects connected with his profession, and by several important additions which he made to the general stock of medical knowledge. Amongst these was the discovery of a cure for the ganglion of the nerves and of the lymphatic glands.

From Kidderminster he removed to Worcester, where he continued to practise till within a few days of his death, which happened in 1802, in the seventy-third year of his age. His death was much regretted, and it was then considered that the medical science had by that event lost one of its brightest ornaments. Dr. Johnstone acquires no small degree of additional celebrity from his having been the intimate friend of the amiable George Lord Lyttleton, and from his being the author of the affecting account of that nobleman's death inserted by Dr. Johnson in his *Lives of the Poets*.

In a letter which he addressed to the editor of *Doddridge's Letters*, he says—"Lord Bacon reckons it a great deficiency in biography that it is for the most part confined to the actions of kings and princes, and a few persons of high rank, while the memory of men distinguished for worth and goodness in the

lower ranks of life has been only preserved by tradition." The latter character was Dr. Johnstone's, and the deficiency would indeed have been great had his name been omitted in the list of those who have deserved well of their country and of posterity. His general character and conduct are spoken of in terms of high admiration by all his contemporaries and biographers; and the serenity of his death, the cheerful and resigned spirit in which he contemplated and awaited that event, is made a conspicuous feature in the history of his useful but unobtrusive life. His celebrity as a medical practitioner was very great, and his professional skill was fortunately associated with a singular degree of kindness and amenity of manner—qualities to which the Rev. Job Orton, a man himself celebrated for piety and talent, thus bears testimony:—"I left Shrewsbury and came to Kidderminster that I might have the advice of a very able and skillful physician, Dr. Johnstone, who hath always proved himself a faithful and tender friend, to whose care as a physician I, under God, owe my life, and to whose friendship I am indebted for some of the greatest comforts of it."

Several of Dr. Johnstone's physiological inquiries were published in the *Philosophical Transactions*, and are to be found in the 54th, 57th, and 60th volumes of that work. They were afterwards enlarged and printed separately.

JOHNSTON, JAMES F. W. This excellent practical chemist, who applied the science of chemistry to agriculture, was born at Paisley in 1796, but in infancy and boyhood, in consequence of the repeated migrations of his father, he first removed to Manchester, and afterwards to Kilmarnock in Ayrshire. During this time his education had been going on; and resolving to devote himself to the clerical profession, he studied at the university of Glasgow, supporting himself in the meantime, like many of his fellow-students, by private teaching. Having finished his courses of philosophy and theology, he became a licentiate of the Church of Scotland; he also opened a school at Durham, and solaced himself with its drudgery while he patiently awaited the uncertain chances of clerical promotion. From this uncertain position, however, he was delivered by a marriage with one of the daughters of the late Thomas Ridley, Esq., of Park End. Possessing by this union a competent income, he abandoned his school, and devoted himself to the study of chemistry, to which he had long felt a preference, and to perfect himself in the science he removed to Sweden, and became the pupil of the celebrated Berzelius. His proficiency was so rapid and remarkable, and his reputation as a chemist so fully established, that before returning to Scotland in 1833, he was appointed to the readership of chemistry and mineralogy in the university of Durham, then newly established, the charge being kept vacant until his return from Sweden. This appointment he retained until his decease, although he made the neighbourhood of Edinburgh his regular home, giving his attendance during term time only at Durham.

During the first year of his readership, Professor Johnston appears to have chiefly confined himself to researches in pure chemistry, and in this period he produced a valuable series of papers on the *Chemistry of the Resins*, and other similar subjects. This, however, was too narrow a range for the practical and expansive mind of the professor, and in 1840 the period arrived when his general reputation was to commence. In that year Liebig laid before the British Association his *Treatise on Chemistry applied to Agriculture and Physiology*, and

Johnston enthusiastically threw his mind into the subject. His proper vocation had been suggested; he devoted himself at once to the study of agricultural chemistry, and soon afterwards he delivered a course of lectures in that department of the science to the Durham County Agricultural Society, which, commencing in 1841, were finished in 1844, and composed when published, during the last year above mentioned, one large octavo volume. During the issue in parts of this publication, which contained the pith and substance of his lectures, the attention not merely of the practical farmers of England, but those of Scotland also, was powerfully attracted to the subject; and while his *Lectures on Agricultural Chemistry and Geology* confirmed his reputation as the chief British authority in this important department, in 1843, when the Agricultural Chemistry Association of Scotland was established, Professor Johnston was elected as the fittest person to hold the office of its chemist. His laboratory in Edinburgh thus became the central point of the agricultural chemistry of his native country, and during the five years in which he held this office his assiduity was unwearied, while his researches, which were of extraordinary extent and immense practical utility, inspired our farmers with a scientific intelligence of their profession to which hitherto they had been almost entirely strangers. As the Agricultural Chemistry Association for Scotland had been established only for five years, being incorporated at the end of that time with the Highland Society, Johnston left Edinburgh, and returned to his permanent charge at Durham.

While thus actively employed in experimenting, the pen of the professor had not been idle; and besides his highly popular lectures, he published a *Catechism of Agricultural Chemistry and Geology*, which was so popular that thirty-three editions have been published in this country alone. Nor was this all, for it has been translated into nearly every language in Europe, and been widely disseminated over the United States of America, where his reputation is as warmly cherished as in Britain, and where his lessons find a fresher and wider field of occupation. Soon after his return to Durham he was invited to deliver lectures on agricultural chemistry in the United States and Canada, with which he complied; and on coming home he published his work entitled *Notes on North America*, which though less professional than his other writings, contains important observations on the agriculture and general social condition of North America, and its vast resources in soil and climate. Besides these entire productions, he wrote several articles which were published in literary and scientific magazines, among the latter of which it is sufficient to mention *Blackwood's Magazine* and the *Edinburgh Review*. But the most popular, and perhaps the most useful, of all his works was the *Chemistry of Common Life*, which he commenced only two years before he died. Than this work no scientific publication has been more popular, and while the style is so simple as to attract general readers, and so intelligible as to be understood by the most unlearned, the subject is of such vital importance that all feel interested in it. The last effort of his pen was employed in the production of a kindred work entitled the *Geology of Common Life*, when his career was unexpectedly terminated. He had been upon the Continent for several months, and was about to return to England, when he caught cold, but did not apprehend any serious results. Scarcely, however, had he reached his home in Durham, when symptoms of hemorrhage in the lungs appeared, and he died of a rapid

decline on the 18th of September, 1855, aged fifty-nine years. Such was the end of this scientific Triptolemus, who taught mankind at large how to cultivate the soil to the best advantage, and how to use its produce, and who will continue to be the benefactor of millions who may be ignorant even of his name. His valuable scientific apparatus he generously bequeathed to the Free Church College of Edinburgh.

JOHNSTON, JOHN, a Latin poet and classical scholar of considerable eminence in the earlier part of the seventeenth century. Though this individual is one of the ornaments of a very distinguished age of Scottish literature, the date of his birth is not accurately ascertained, but it must have been previous to the year 1570, as in 1587 he began to be known to the world. He styles himself "Aberdonensis;" and as he was a member of the House of Crimond, he was probably born at the family seat near Aberdeen. Dr. Mc'rie, whose minute labours have thrown so much light on the literary history of this period, has, among other facts connected with Johnston (which we shall here carefully recapitulate), discovered the name of his master from the last will of the poet, in which he affectionately leaves to that individual his white cup with the silver foot.¹ The same instrument appoints as one of his executors, "Mr. Robert Johnston of Creimond," probably his brother, a person who appears to have been in 1635 elected provost of Aberdeen.² Johnston studied at King's College in Aberdeen, whence, after the usual custom of the age, he made a studious peregrination among the continental universities, which he continued during a period of eight years. In 1587 we find him at the university of Helmstadt, whence he transmitted a manuscript copy of Buchanan's *Sphæra* to be re-edited by Pincier, along with two epigrams of his own.³ In 1587 he was at the university of Rostock, where he enjoyed the intimacy and correspondence of the elegantly learned but fanciful Justus Lipsius.

Johnston appears to have early embraced the doctrines of the Presbyterian Church of Scotland, and to have retained them with the characteristic firmness of the body. He was the intimate friend of its accomplished supporter Andrew Melville, whose influence probably procured him the appointment to the professorship of divinity in the new college of St. Andrews, as successor to John Robertson—an advancement which he obtained previously to the year 1594, as he is discovered, under the term "maister in the new college," to have been elected one of the elders of St. Andrews, on the 28th November, 1593. Johnston was a useful assistant to his illustrious friend in the opposition to the harassing efforts of King James to introduce Episcopacy. He must have been included in the interdict of the visitation of the university commission, by which the professors of theology and philosophy, not being pastors of the church, were prohibited from sitting in church-courts, except through an election regulated by the council of the visitation; and in the General Assembly which met at Dundee in 1598, whither both had resorted to oppose the too great tenderness of James for the church, in proposing to admit its representation in parliament, Melville and Johnston were charged to quit the city, with the

¹ Item—I leave to Mr. Robert Merser, Persoun of Banquhorie (Banchory, near Aberdeen), my auld kynd maister, in token of my thankfull dewtie, my quhyt cope with the silver fit. — Mc'rie's *Melville*, i. 357.

usual formality of the pain of rebellion in case of refusal. In 1603 these friends again appear acting in concert, in a correspondence with Du Plessis, on the subject of the synod of Gap in France having censured certain peculiar opinions on the doctrine of justification. "They did not presume to judge of the justice of the synod of Gap, but begged leave to express their fears that strong measures would inflame the minds of the disputants, and that a farther agitation of the question might breed a dissension very injurious to the interests of the evangelical churches. It appeared to them that both parties held the Protestant doctrine of justification, and only differed a little in their mode of explaining it. They therefore, in the name of their brethren, entreated Du Plessis to employ the authority which his piety, prudence, learned writings, and illustrious services in the cause of Christianity had given him in the Gallican church, to bring about an amicable adjustment of the controversy."¹ Without inquiring into the minutiae of the controversy, the knowledge that it was a theological one is sufficient to make us appreciate the advice as exceedingly sound; and we have the satisfaction to know, as a rare instance, that it produced the desired effect.

During the previous year Johnston had published at Amsterdam his first complete poetical work, entitled "*Inscriptiones Historica Regum Scotorum, continuata annorum serie a Fergusio I. ad Jacobum VI. Præfixus est Gathelus, sive de gentis origine, Fragmentum Andree Melvini. Additæ sunt Icones omnium Regum nobilis Familiæ Stuartorum*," 4to; and in 1603 he published at Leyden *Heroes ex omni Historia Scotica Lectissimi*, 4to. Both these productions have been preserved in the *Delitia Poetarum Scotorum*, by the author's relative, Arthur Johnston. The former is a series of epigrammatic addresses to the Scottish monarchs, commencing with Fergus I., and duly passing through the extended list to the reigning monarch James VI.; regarding whom it is worthy of commendatory remark, that the author is more lavish of congratulations on the good fortune which Providence had bestowed on him than on his talents or kingly qualities. The *Heroes* is a tissue of similar epigrams addressed to the heroes who distinguish the reigns of the same line of kings, commencing with Ferchard, the great commander-in-chief of King Reuther. Of course, both works laud the virtues of many men who never drew breath. The merits of Johnston as a poet cannot be said to rise beyond those of the mere epigrammatist: to the classical elegance of his Latinity we believe few objections can be found, but he displays more of the neatness of illustration and precise aptness of association, which may be taught, than of the inborn poetic fire; and his works are perhaps more pleasing in the restrictions of a classical tongue, than they might have been had he allowed himself to range in the freedom of his vernacular language. When treating of those who never existed, or of whom little is known, the absence of all interest from the subject adds to the coldness of the epigram, and leaves room for the mere conceit to stand alone; but in treating of interesting or remarkable events, Johnston could sometimes be lofty, and strike a chord of feeling. We might instance, as favourable specimens, the epigram to the family of the Frasers, massacred by the Clanranald in 1544, and that to Robert the Bruce. In 1609 Johnston published at Leyden, *Consolatio Christiana sub Cruce, et Iambi de Felicitate Hominis Deo reconciliati*, 8vo; in 1611 he published *Iambi Sacri*; and in 1612, *Tetrasticha et Lemmata Sacra*—

Item Cantica Sacra—Item Icones Regum Judeæ et Israelitis. Lugd. Bat.²

Johnston died in the month of October, 1612; the last scene of his life is drawn by James Melville in a letter to his uncle, dated the 25th of November ensuing; of which we cannot avoid giving the terms as translated by Dr. M'Crie. "Your colleague John Johnston closed his life last month. He sent for the members of the university and presbytery, before whom he made a confession of his faith, and professed his sincere attachment to the doctrine and discipline of our church, in which he desired to die. He did not conceal his dislike of the lately-erected tyranny, and his detestation of the pride, temerity, fraud, and whole conduct of the bishops. He pronounced a grave and ample eulogium on your instructions, admonitions, and example; craving pardon of God and you for having offended you in any instance, and for not having borne more meekly with your wholesome and friendly anger. As a memorial he has left you a gilt velvet cap, a gold coin, and one of his best books. His death would have been a most mournful event to the church, university, and all good men, had it not been that he has for several years laboured under an incurable disease, and that the ruin of the church has swallowed up all lesser sorrows, and exhausted our tears."³

We learn that he had married Catharine Melville, of the family of Carribee—but at what period seems not to be known—and he has left behind him epitaphs on her and their two children. It appears that in 1600 he had been solicited to become "second minister" of Haddington. Besides the works already mentioned, there exist, or did exist, by him in MS. in the Advocates' Library, "*Περὶ Στεφανῶν* sive de Coronis Martyrum in Scotia Liber Unus"—"*De Coronis Martyrum in Anglia Libellus alter*"—and "*Peculium Ecclesiæ Scoticanæ, et alia quedam Poemata*." He wrote epigrams on the chief towns of Scotland, which have been appropriately inserted in Camden's *Britannia*; and some of his letters are to be found in the correspondence of that eminent antiquary. Andrew Melville says, "*Mr. Johne Davidsons left sum nots behind of our tyme, and so did Mr. Johne Johnston*;" what has become of these we know not.

JOHNSTON, ROBERT, an historian, existed in the earlier part of the seventeenth century. The works of this individual are well known, but he has not achieved personal eminence; and we neither know when he was born, nor the station which he occupied in life. At Amsterdam was printed, in 1655, his *Historia Rerum Britannicarum, ut et multarum Gallicarum, Belgicarum, et Germanicarum, tam politicarum quam ecclesiasticarum, ab anno 1572 ad 1628*.

This work was intended as a continuation of Buchanan; and Bishop Nicholson, no bestower of heedless praise, appears to think that it nearly equals in style the work which it imitated.⁴ Lord Woodhouselee, a less scrupulous critic where a Scotsman was concerned, calls it "A work of great merit, whether we consider the judicious structure of the narrative, the sagacity of the reflections, the acute discernment of characters, or the classical tincture of the style. In those passages of his history," says this writer, "where there is room for a display of eloquence, he is often singularly happy in touching

² Maidment's *Catalogues of Scots Writers*, 14; Sibbald's *Bibliotheca Scotica*, MS. 49. There is some difference in the names, as recorded by these two writers, and never having seen the works themselves, we take what appear to be the more correct titles.

those characteristic circumstances which present the picture strongly to the mind of the reader, without a vain parade of words or artificial refinement of sentiment. We may cite as an example, his description of the death of Mary, Queen of Scots, lib. iv. *sub anno* 1586: and the circumstances attending the death of Essex, with the author's reflections on that event, lib. ix. *sub anno* 1641." The same author farther mentions that Robert Johnston was one of the executors of George Heriot, the founder of the hospital.¹ Johnston, besides this *Historia Rerum Britannicarum*, wrote *The History of Scotland during the Minority of James VI.*, published at London in 1646. Wodrow mentions an *Epitome Historiæ Rerum Britannicarum*, published, according to his account, in 12mo, in 1642, some time previously to the appearance of the larger work.² Sir Robert Sibbald seems to find nothing more remarkable to tell us about Johnston than that he was on intimate terms with Bruce, Baron of Kinloss. "Robertus Jonstonus baroni Killosensi Brusio dum viveret, charus: vir varîæ lectionis, egregiæ eruditionis, limati iudicii." He mentions that Johnston is *said* to have died in 1630, and gives us an epigram on his history from the pen of Joannes Owen.³ There is in the Advocates' Library a ponderous manuscript history of Scotland, by a person of the name of Johnston, and generally understood to be at least partly written by the subject of our memoir. The manuscript has belonged to Lord Fairfax, and at the commencement is the following note in his handwriting:—

"Of the gift of Mr. David Johnston, Burgess of Edinburgh, itt beinge the labour of his late father and grandfather (the first draught). A transcript whereof he reserves to himself (but is not all printed), nor is ther any copy therof, but onely this, beinge for the most part a translation of Bucquhanan, but with very many additions not thought fit to publish. FAIRFAX.—20th October, 1655."

JONES, PAUL (originally JOHN PAUL), a nautical genius of no ordinary character and endowments, was born at Arbigland, in the parish of Kirkbean, and stewartry of Kirkcudbright, in the month of July, 1747. He was the reputed son of John Paul, who acted as gardener to Mr. Craik of Arbigland, by his wife, who had been cook to the same gentleman. It was generally believed, however, that Mr. Craik was the real father of this extraordinary adventurer. The education of Paul Jones—to use the name which he assumed in after-life—was in no respect different from that usually given in Scotland to boys of his rank; and it is not recorded that he showed any symptoms, while at school, of that capacity by which he was undoubtedly distinguished in advanced life. From his earliest years he manifested a decided predilection for a seafaring life, and at the age of twelve was apprenticed as a mariner to a Mr. Young, a respectable merchant in Whitehaven, whence he made his first voyage in 1760, in the ship *Friendship* of that port, under the care of a Captain Benson, for the Rappahannoc, Virginia. Living on the shore of the Solway, all the amusements and ideas of young Paul seem to have been from his very cradle maritime. While yet a mere child he hoisted his mimic flag, rendezvoused his tiny fleet, and gave forth his orders to his imaginary captains, with all the consequence of a veteran commander. The town of Dumfries was at this period deeply engaged in American trade, particularly in importing tobacco,

and the Nith being too shallow to float the larger vessels up to the town, their cargoes were discharged at Carsethorn, on the Galloway coast, where the subject of this memoir was a daily observer of their operations, and not unfrequently ventured to challenge the modes of procedure followed by experienced seamen. Here, too, he had early and abundant opportunities of becoming acquainted with the colonists engaged in that traffic, whose bold and liberal sentiments seem, at a very early period of his life, to have made the New World, as he afterwards expressed himself, "the country of his fond election." These early impressions were doubtless aided by the circumstance of an elder brother having settled there, and being in the full enjoyment of the peace and the plenty with which, so long as the states were submissive colonies of Great Britain, it was universally admitted the inhabitants were generally blessed. With this brother he made his abode during the time his ship was in the Rappahannoc on his first voyage, and most probably on his subsequent voyages; which could not fail in some degree to have attached him to the country, though he had been devoid of any prepossessions in its favour. The early indications of genius which we have noticed above, were fully supported in his new station. His singular intelligence and propriety of conduct excited the wonder, and, in some degree, the respect of his shipmates, at the same time that they gained him the esteem and the confidence of his employer, who promised to give him the proof of his approbation by appointing him to the command of one of his ships. Unfortunately for both parties untoward circumstances prevented the master from having it in his power to pay this substantial tribute of respect to the merits of his faithful apprentice, whose time having expired, he entered upon the command of a slave-ship, and made several voyages to the coast of Africa in prosecution of that disgraceful traffic. How long he continued in this trade his biographers have not told us; but to his honour they have stated that he felt disgusted with the employment, and at length "confined his services to the command of vessels engaged in a more reputable and legitimate commerce." In the year 1773 the death of his brother in Virginia, without having left any children, called him over to that country to look after the settlement of his affairs, on which occasion, all his transatlantic predilections being revived, he resolved to withdraw from the vicissitudes of a seafaring life, to settle in the colony, and to devote the remainder of his days to the peaceful pursuits of rural industry and philosophic retirement.

There is nothing more curious in the history of the human mind than that satiety and languor which so frequently come over the most active spirits. Cowley often had thoughts of burying himself in the woods of America, where he fancied he would be happy, in seclusion from all intercourse with the busy and bustling portions of society: Cromwell, with all his unconquerable daring and unquenchable activity—and Hampden, one of the brightest, the boldest, and the most disinterested spirits that have adorned any age or country, despairing of the state of political affairs in their native land, sought to escape their uneasy sensations, and to secure religious peace and happiness, by the same expedient. Akin perhaps to these cases was that of Paul Jones, whose mind seems from the first to have been replete with lofty aspirations, fitting him for greatness, while his connections in his own country were of a nature to prevent his ever gratifying them. We can easily conceive this bold and enthusiastic man sensible of the superiority of his powers above those of most

³ *Sibbald's Biblioth. Scot.* MS. 221.

other men, but fretting at the cold obstructions which were put before him by the rules and habits of society in his own country, and also perhaps at the notoriety of his ignoble origin; and therefore preferring to lose himself in an American forest, where, if he did not gain any distinction, he would not at least be esteemed as lower than his personal merit warranted. Had the colonies been in a state of tranquillity, Jones would probably have spent the remainder of his days as a simple colonist, or perhaps gone back to sea to escape the monotony of a life but little suited to his faculties. The country, however, was now in a state of high effervescence, which was every day increasing, and which called forth the energies, such as they were, of every individual among them, either on the one side or the other. Great dissatisfaction had for a long period been prevalent respecting the measures of the British government in reference to the colonies, and in the speculations of the colonists with regard to the steps necessary to be taken for counteracting these measures Jones found the tedium of his retirement wonderfully relieved. Open resistance was no sooner proposed than he found that he had mistaken the natural bent of his genius, which was much more turned towards action than solitary speculation; and when congress, in the close of the year 1775, began to equip a naval force to assist in asserting American independence, he stepped boldly forward to offer his service. He was at once appointed to be first lieutenant aboard the *Alfred*, one of the only two ships belonging to the congress; and in that capacity hoisted with his own hands for the first time the flag of independent America. In the course of a few months, by his activity and success, he gained the entire confidence of the marine committee, and from the hands of the president received a captain's commission. In the end of the year 1777 he was sent to France in command of the *Ranger*, a new sloop of war, with despatches containing an account of the victory obtained by the colonists at Saratoga. As a reward for the important services he had already rendered to the Americans, it was ordered that he should be promoted to the command of the *Indian*, a fine frigate built for the congress at Amsterdam, the *Ranger* at the same time acting under his orders; but the American commissioners at Paris, from motives of policy, assigned the *Indian* over to the King of France. Captain Jones, of course, remained in command of the *Ranger*, with which he convoyed a fleet of merchantmen to Quiberon Bay, and there, from the French commandant, received the first salute that had ever been given to the American flag. Highly indignant at the resolution taken by the British government to treat every colonist who supported congress in their aims at independence as traitors, and envious of the exploits of some British seamen on the American coast, Jones soon after entered the Irish Channel, and on the night of the 22d of April came to anchor in the Solway Firth, almost in sight of the trees which sheltered his native cottage. The place must have awakened many strange associations, but they were of no friendly import. With thirty-one volunteers he sailed in two row-boats for the English side of the firth, with intent to burn the shipping (upwards of 200 sail) in the harbour of Whitehaven. This bold and hazardous project he had certainly executed if the receding tide had not retarded his progress so much, that the day began to dawn before he reached the shore; as it was, he could scarcely have failed had he been seconded by his followers. The smaller of the boats he sent to the north of the port, to set fire to the ships, whilst he himself passed southwards to secure

the fort. The morning was cold, and the sentinels, unsuspicious of the approach of an enemy, were in the guard-room; a circumstance of which Jones knew well how to take advantage. Climbing up by the shoulders of one of his men, he crept through one of the embrasures, and was promptly followed by all his company. Making fast the door of the guard-room, he spiked every gun on the fort, thirty-six in number, and, without having hurt a single individual, proceeded to join the party who had it in charge to burn the ships. A false alarm had deterred this party from executing their orders. Jones, however, proceeded to fire the ships within his reach; but the inhabitants were by this time alarmed, and hastening to the protection of the port; and he was compelled with his small party to retreat, after having set fire to three ships, one of which only was totally destroyed. This achievement cannot be denied the praise of singular daring; yet there is something so unnatural in making war upon one's native land, and especially one's native city, improving all the knowledge and the associations of early years for the purposes of destruction, that every generous mind revolts at the idea, and cannot award the praise which, it may be admitted, would otherwise be due to the undertaking. But this attempt was only the first exploit which signalized the 22d of April. Early in the forenoon he landed with a part of his crew at St. Mary's Isle, on the Galloway coast, the beautiful residence of the Earl of Selkirk, whom he hoped to have surprised, and carried off a prisoner to America, that he might serve as a hostage for the security of such of the colonists as should fall into the hands of the British. Happily for his lordship he was not at home, and Jones, as he approached the house, and learned that there were only ladies within it, wished to return to his ship without farther procedure; but his followers had no such hazarded ideas. In venturing upon an undertaking so hazardous, they were influenced by the hope of plunder, which, being now in view, they refused to relinquish. He succeeded, however, so far, that they agreed to offer no violence to any one, that they should not enter the house, and that the officers, having made their demand, should accept of what might be put into their hands without further inquiry. These stipulations were punctually fulfilled; but the inmates of the house were not aware of them, and, terrified for their lives, were glad to redeem them by delivering up the whole family plate, which was carried off in triumph by the sailors, who neither understood nor cared for the discredit which it brought upon their intrepid commander and the cause they served. The circumstance was, as he probably foresaw, improved with great effect to his disadvantage. To heighten the odium of the affair, it was industriously, but most falsely, given out that the father of Jones had been gardener to the Earl of Selkirk, and that it was from this circumstance he had learned all the localities of the estate, which enabled him to commit the robbery without danger either to himself or his marauding crew. Not one of Jones' relations had ever been in the service of Lord Selkirk; and he showed that he had a spirit far above the meanness imputed to him, by buying the whole of the articles from the captors, who claimed them as their right by the usages of war, and, at a subsequent period, restoring them, in their original packages, to the noble owner. In a correspondence which was carried on between Jones and Lady Selkirk relative to the affair, her ladyship most gratefully acknowledged the generosity and the integrity of his character.

But these exploits on shore did not exhaust the

good fortune of Jones. The very next day, in the bay of Carrickfergus, he fell in with the *Drake*, a king's ship of twenty guns, and after a desperate resistance, in which the English captain and his first lieutenant were both killed, made her his prize, with which, and another large ship, he returned to Brest, after an absence of twenty-eight days. In this short period, besides destroying a number of valuable ships, he had thrown the coasts both of Scotland and Ireland into the deepest consternation. This cruise, short as it was, occasioned the British government immense sums of money for the fortification of harbours, and it was the ostensible cause of embodying the Irish volunteers.

Notwithstanding the brilliant success that had attended his exertions, Jones was now subjected to no small degree of mortification. As a token of goodwill to the United States, the French ministry had promised to furnish him with a ship, aboard of which he was to hoist the American flag; but after multiplied applications, and a number of written memorials, the engagement seemed to be forgotten or disregarded. Worn out with the delays and apologies which he was daily receiving, Jones set out for Paris to make his application to the French ministry in person, in consequence of which he obtained the command of the *Duras*, a ship of forty guns, the name of which, in compliment to a saying of Poor Richard, "If you would have your business done, come yourself," he changed to *Le bon homme Richard*. In this vessel, badly manned and poorly furnished, Jones sailed with a little squadron, to which he acted as commodore. This squadron consisted of the *Alliance*, of thirty-six guns, the *Pallas* of thirty-two, the *Serf* of eighteen, the *Vengeance* of twelve, and two privateers, who were promised their share of the prizes that might be made. Having taken a number of prizes, the *Alliance*, the *Serf*, and the privateers deserted him, in order to pursue their own plans singly. The courage and skill of the commodore, however, did not forsake him, and after again alarming the coasts of Ireland, he sailed by the North Sea round to Leith, in the roads of which he appeared with his own ship, the *Richard*, accompanied by the *Pallas* and the *Vengeance*, in the month of September, evidently determined to seize upon the guard-ship and two cutters that lay in the roads, and to lay Leith and perhaps the city of Edinburgh under contribution. The wind, however, which was fair when he made his appearance, shifted during the night, and the next day he continued working up the firth with great labour and slow progress. While he was thus employed, a boat from the shore, sent out by an official character, who mistook his ships for British, informed Jones that he was greatly afraid of a visit from that desperate buccaneer Paul Jones, and begging that he would send him some powder and shot. Highly amused with his mistake, the good-humoured republican sent him a barrel of gunpowder, with a civil answer to quiet his fears, and a modest apology for not including shot in the present he had sent him. In the meantime he relaxed nothing in his exertions to come at the ships of war in the roads, and other two tacks would have laid him alongside of them, when a sudden gale of wind sweeping down the firth sunk one of his prizes, and carried his squadron irresistibly out to sea. The captains of the *Pallas* and *Vengeance* were so much dejected at this accident, that they could not be prevailed upon to renew the attempt. His little squadron shortly after fell in with the homeward-bound Baltic fleet, under convoy of his majesty's ships the *Serapis* and the *Countess of Scarborough*. A desperate engagement ensued, in which Jones displayed the most

consummate skill, dauntless intrepidity, and perfect presence of mind. The battle was obstinately contested; but the *Countess of Scarborough* was at last obliged to strike to the *Pallas*, and the *Serapis* to the *Bon Homme Richard*, which was so shattered in the action, that next morning, after all hands had left her, she went to the bottom. Though the *Serapis* was nearly in the same condition, Jones hoisted his flag aboard of her, and under jury-masts with some difficulty steered her along with his other prizes into the Texel. He now used all his influence with the French court to have his prisoners exchanged against American prisoners in England, in which he had the pleasure of succeeding to the utmost of his wishes, receiving, in a short time after, a letter from Benjamin Franklin, the American minister at Paris, which informed him, "that he (Franklin) had just completed the noble work which he (Jones) had so nobly begun, by giving liberty to all the Americans that then languished in England." The French ambassador at the Hague was at the same time ordered to communicate to Commodore Jones the high sense which his majesty the King of France entertained of his merits, and the personal esteem he bore for his character, and especially for his disinterested humanity.

Jones now took the command of the *Alliance*, the captain of which had been summoned to Paris to answer for his insubordination in deserting the commodore on the coast of Ireland; but his situation was now perilous in the extreme. Summoned to deliver him up to the vengeance of the English government as a pirate and a rebel, the Dutch were constrained to order him out to sea, where an English squadron was watching to intercept him. From this dilemma he could have been saved by accepting of a commission from the King of France, whose ambassador earnestly pressed him to adopt that alternative; but he thought himself bound in honour to decline the offer, and determined, at whatever hazard, to abide by and support the flag of the country which he had, upon the maturest reflection, adopted. "Fortune favours the brave" is a maxim we see every day exemplified. Jones weighed anchor and escaped through the Straits of Dover, almost under the eyes of the English men-of-war, all of which had strict orders to secure him, and were besides inflamed against him in a high degree from the repeated defeats that British ships had sustained at his hands.

Towards the close of the year 1780 he sailed with important despatches for America in the ship *Ariel*, and by the way, meeting an English ship of twenty guns, engaged her, and with his usual gallantry made her his prize. The King of France had, previously to this, testified his approbation of Jones' services by presenting him with a superb gold-hilted sword; and a letter from the French minister, M. de Sartine, was now transmitted to the President of the United States, requesting liberty "to decorate that brave officer with the cross of the order of military merit." The letter was laid before congress, and, a law acceding to the proposal being passed on the 27th of February, he was formally invested by the Chevalier De la Luzerne, at a public fête given to the members of that body. Congress, in the month of April following, on the report of a committee, passed a vote of thanks to the Chevalier John Paul Jones "for the zeal, prudence, and intrepidity with which he had sustained the honour of the American flag, for his bold and successful enterprises to redeem from captivity those citizens of America who had fallen under the power of the enemy, and in general for the good conduct and eminent services by which he had added lustre to his character and to the arms of America."

No farther opportunity for distinguishing himself occurred during the war; but, after its conclusion, congress, as an expression of gratitude, had a gold medal struck with appropriate devices to perpetuate the memory of his valour, and the singular services he had performed for the States.

In the year 1787 the Chevalier Jones, being charged with a mission to the court of Denmark, sailed for that country in the month of November, and passing through Paris on his way, he was strongly solicited by the agents of Russia to take the command of the Russian fleet in the Black Sea. This he declined, but he was scarce arrived at Copenhagen when the Empress Catharine sent him, by a special messenger, an urgent invitation to visit St. Petersburg. After what he had performed it would have been strange if the Chevalier Jones had not felt some reluctance to enter into the service of Russia, where every maxim by which he had been guided during his exertions for liberty behoved to be reversed, and where, instead of being directed by the united voice of an intelligent people, he must regulate his conduct by the single will of a despot. It is one of the greatest evils of despotism that the despot, once established, has the means of corrupting and enslaving even the most generous minds. The Chevalier Jones saw many reasons for declining to enter into the service of Catharine; but, flattered by her attention and kind offers, he thought he could not do less than to wait upon and thank her in person for her friendly intentions. For this purpose he set out instantly from Copenhagen, by the way of Sweden, but at Gushelham found the Gulf of Bothnia blocked up by the ice. After making several unsuccessful attempts to reach Finland by the islands, he conceived a plan for effecting his progress by doubling the ice to the southward. With this view he sailed from Gushelham in a boat thirty feet long, followed by a smaller one that might be hauled over the ice, but told none of those who accompanied him what were his intentions. Having set out early in the morning, he had by the evening got nearly opposite Stockholm, when, instead of landing as the boatmen expected, he drew out a pair of pistols and ordered them to proceed in the direction he had previously determined upon. Resistance with a man of the chevalier's character was probably judged by the simple boatmen to be in vain; and following his orders, with a fair wind they expected to reach the coast of Finland by the morning. An impenetrable bar of ice, however, defied all their efforts, nor from the state of the weather was it possible for them to return. Their only resource was to sail for the Gulf of Finland, which they did, steering at night by a pocket-compass, lighted by the lamp of the chevalier's carriage, and in four days, having lost the smaller of their boats, landed at Revel in Livonia. The chevalier hasted from Revel to St. Petersburg, where he met with a most gracious reception, and, unable any longer to hold out against the kind wishes of the empress, entered into her service without any stipulations but that he should not be at any time condemned without being heard. Invested with the rank of rear-admiral, he proceeded without delay to take the command of a fleet stationed at the Liman or mouth of the Dnieper, destined to oppose the Turkish fleet under the Capitan Pacha. He hoisted his flag as commander of this fleet on the 26th of May, 1788, on board the *Vlodimer*, and was supported by a flotilla under the Prince of Nassau, and a number of land troops under Prince Potemkin.

Throughout this campaign, though it produced little that is worthy of the notice of the historian, the Chevalier Jones had many opportunities of displaying his professional skill and the singular intrepidity of his character; but mean jealousy and the malignant caballing of heartless and narrow-minded courtiers denied him the well-earned praise that was due to his services. He was however, on his return to St. Petersburg, as an acknowledgment of his fidelity, invested with the order of St. Anne, and informed that in a short time he would be called to perform a part in services of much greater importance. He had seen enough of the Russians, however, and disgusted with the sordid selfishness and the low sensuality that reigned in the court of Catharine, took leave of her dominions in the month of August, 1789. The remainder of his days he spent partly in Holland and partly in France, devoting his leisure hours to the arrangement of his affairs, and to the preparation of papers which might exhibit his character and his services in their true light to posterity. He also made a large collection of important documents relating to the public transactions in which he had been engaged, which will be at some future day, it is to be hoped, given to enrich the history of the important period in which he lived. He was seized with water in the chest, and died at Paris in the month of July, 1792. As the laws relative to the interment of Calvinists or heretics were not then abolished in France, application was made to the national assembly, which gave free liberty for his being buried with all public honours, and ordered a deputation of their number to attend, one of whom pronounced an elegant eulogium upon his character over his grave. He left among his papers a copious memoir of his life written with his own hand, which his friends, it has been said, had it in contemplation to publish. We cannot doubt but that its publication would add to the history of that important era many valuable notices, and be hailed by the public as a most valuable contribution to the general stock of literature. From the brief sketch of his life which we have given, the reader will be at no loss to appreciate the character of Paul Jones, which, in his own country, has been misrepresented by prejudice. That he was a naval genius of the first order his actions abundantly demonstrated. He was the man who first flung upon the winds the flag of the United States; and he graced it by a succession of victories, all of which were relatively of the most splendid character. Unlike the vaunted achievements of single ships belonging to the same nation in the subsequent war, every one of which possessed a vast superiority of men and of metal, Jones accomplished his purposes with means to all appearance inadequate to the end, his ships being often half-rotten, only half-provided in necessities, and his sailors of the most motley description. In every battle which he fought superior skill and bravery were the evident sources of victory. Nor can the circumstance which has been so often urged against him, that of turning his arms against his native country, detract in the smallest degree from his merit. He was, be it remembered, at the commencement of the war, a regular colonist of America, and was therefore no more liable to this charge than was any other individual out of all the thousands who at first took up arms against Great Britain, and eventually constituted the American republic. Less, however, can be said for his entering the service of Russia, which was discreditable to his generosity and love of freedom.

K.

KAMES, LORD. *See* HOME (HENRY).

KAY, JOHN, long well known in Edinburgh as a miniature-painter and caricaturist, and almost the only artist of the latter kind produced in Scotland, was born in April, 1742, at a place called Gibraltar, near Dalkeith. His father and an uncle named Norman were both stone-masons, and he was himself destined to follow the same profession. Having lost his father, however, in his eighth year, this scheme was given up, and he was placed with some relations of his mother in Leith, who, it appears, treated the poor orphan boy with great cruelty—almost to the hazard of his life. He also was oftener than once, while in this situation, in danger of drowning in Leith harbour.

At the age of thirteen he was placed by his mother with a barber in Dalkeith, whom he served for six years; he then set up in Edinburgh, having first paid about £40 to the society of surgeon-barbers for the freedom of the corporation, and soon after married a young woman, by whom he had eleven children, all of whom long predeceased himself. The trade of a barber was then more lucrative, and consequently more dignified, than latterly. Kay had good employment in dressing the wigs and trimming the heads of a certain number of gentlemen every morning, all of whom paid him a certain annual sum (generally about four guineas) for his trouble. Among his customers was a fine specimen of the old Jacobite country gentleman, Mr. Nisbet of Dirleton, who took a fancy for him, and frequently invited him to the country, to the great injury of his business. Kay had, even in his boyhood when residing in Leith, manifested a turn for sketching familiar objects, such as horses, dogs, ships, &c., using chalk or coal, and tracing his delineations on such pieces of dead wall as presented a large enough ground. Now and then in later life he made some attempts in miniatures and pencil sketches. It may easily be conceived that, finding himself possessed of this talent, and encouraged by a man of rank in developing it, he felt some difficulty in restraining himself to the humble career which destiny seemed to have marked out for him. At Mr. Nisbet's country-seat he for the first time found proper opportunities and proper materials for his favourite study; while any compunctious visitings he might feel as to the danger to which he thus exposed the permanent livelihood of himself and family, were laid to rest by the kindness of his patron, who, in the meantime, sent money to support his domestic establishment in Edinburgh, and promised speedily to obtain for him some permanent provision which should render him independent of business. Unfortunately, in 1782, Mr. Nisbet died, without having executed his kind intention; and Mr. Kay was left in somewhat awkward circumstances, having, as it were, fallen to the ground between certainty and hope. The heir, however, so far repaired the omission of his predecessor as to settle an annuity of £20 upon Kay for life.

He now began effectually to follow out his bent for limning and etching, and, after a few trials, abandoned his trade as a barber. In 1784 he published his first caricature, which represented a half-crazed Jacobite gentleman, named Laird Robertson, who was wont to amuse the citizens of Edinburgh by cutting caricatured resemblances of public characters,

which he fixed on the head of his stick, and whose figure was perfectly known to all the inhabitants. The portrait accordingly excited some attention, and the author was induced to attempt others. The style assumed by Mr. Kay was the stippled or dotted style, and nothing could equal the felicity of the likeness. From that time forward, till he was about eighty years of age, this untutored son of genius pursued his vocation, taking off, one after another, the whole of the public and eccentric persons who appeared in the Scottish capital, and occasionally caricaturing any jocular incident that happened to attract attention. To speak of his portraits as caricatures is doing them signal injustice. They were the most exact and faithful likenesses that could have been represented by any mode of art. He drew the man as he walked the street every day: his gait, his costume, every peculiarity of his appearance, done to a point, and no defect perceptible except the stiffness of the figures. Indeed, he may be said to have rather resembled one of the prosopographuses or apographs of modern times, than a living artist trusting to his eye and hand. Hence, nothing can be more valuable in the way of engraved portraits than his representations of the distinguished men who adorned Edinburgh in the latter part of the eighteenth century—the Blairs, the Smiths, and the Robertsons. It was only in certain instances that his productions could be considered as caricatures, namely, in those combinations by which he meant to burlesque any ridiculous public transaction: and even here his likenesses displayed all his usual correctness. During a considerable part of his career Mr. Kay was a professed miniature painter, and executed some specimens which, for delicacy and finish, would surprise such individuals as have only been accustomed to inspect his published etchings. It is said that his only fault in this capacity was a rigid and unbending adherence to likeness—a total want of the courtly system practised in so eminent a degree by Lawrence and other fashionable painters. Once, it is related, he was “trysted” with an exceedingly ill-looking man, much pimpled, who, to add to the distresses of the artist, came accompanied by a fair nymph to whom he was about to be married. Honest Kay did all he could in favour of this gentleman, so far as omitting the ravages of bacchanalianism would go; but still he could not satisfy his customer, who earnestly appealed to his inamorata as to the injustice which he conceived to be done to him, and the necessity of improving the likeness, for so he termed the flattery which he conceived to be necessary. Quite tired at length with this literally ugly customer, and greatly incensed, the miniaturist exclaimed, with an execration, that he would “paint every plook in the puppy's face: would that please him!” It is needless to remark that in this, as in other instances, Mr. Kay lost by his unbending accuracy of delineation.

During almost the whole of his career as an artist Mr. Kay had a small print-shop in the Parliament Square, the window of which was usually stuck full of his productions. He etched in all nearly nine hundred plates, forming a complete record of the public characters, of every grade and kind, including many distinguished strangers, who made a figure in Edinburgh for nearly half a century. It may be safely affirmed that no city in the empire can boast

of so curious a chronicle. From the first to the last there is a remarkable similarity in his style. After forty years' experience he was just as deficient in grouping, and other acquired gifts in the art, as when he first began to use the graver. It would almost appear as if nature had designed him for that peculiar style alone in which he so much excelled all other men, and had denied him every common effect of his art, which other men generally attain with ease.

In a profile of himself, executed about the year 1785, Mr. Kay appears with a handsome aquiline countenance, of much delicacy and ingenuity of expression. In his latter days, when the writer of this notice first saw him, he was a slender but straight old man, of middle size, and usually dressed in a garb of antique cut; of simple habits, and quiet unassuming manners. His head was of a singular structure, presenting a very remarkable protuberance in the forehead, where phrenologists, we believe, place the organs of observation: in Kay, the profile of this feature formed the arc of a perfect circle, beginning under the hair, and terminating at the root of the nose. According to the information of his widow (a second spouse, whom he married in 1787), he cared for and could settle at no employment except that of etching likenesses. He would suddenly quit his lucrative employment in miniature-drawing in order to commit some freak of his fancy to copper, from which perhaps no profit was to be hoped for. It was the conviction of this lady, that if he had devoted himself to the more productive art he would soon have acquired a competency.

Mr. Kay died in Edinburgh, some time in the year 1830. His wife survived him till 1835. After her death the copperplates of his works were purchased by Mr. Hugh Paton, Edinburgh, who republished them in two quarto volumes, with biographical sketches, under the title of *Kay's Edinburgh Portraits*. The work forms a collection altogether unique, and possesses great general as well as local interest, even in a generation comparatively unacquainted with the subjects of the prints.

KEILL, JAMES, a physician and philosopher of eminence, the younger brother of the celebrated person whose memoir follows this in alphabetical order, was born in Scotland on the 27th of March, 1673. He received his early education in Edinburgh, afterwards studying the sciences and languages at Leyden and other continental universities. On his return to Britain he applied himself assiduously to the acquisition of a knowledge of anatomy, studying the science practically by constant attendance at the dissecting rooms. Having accustomed himself to deliver his opinions on anatomy privately to his friends, he at last undertook public tuition, and delivered with considerable applause lectures on anatomy at Oxford and Cambridge, by the latter of which universities he was presented with the degree of Doctor of Medicine. In 1698 he translated from the French, Lemery's *Course of Chemistry*, and soon after published in the *Philosophical Transactions*, "An Account of the Death and Dissection of John Bayles of Northampton, reputed to have been one hundred and thirty years old."¹ To No. 361 of the same journal he gave "De Viribus Cordis Epistola." In 1708 he published *An Account of Animal Secretion, the Quantity of Blood in the Human Body, and Muscular Motion*. On the subject of animal secretion, and the manner in which the fluids of the animal body are separated from the blood, he undertakes to show:

1. How they are formed in the blood before they

come to the place appointed for secretion; 2. In what manner they are separated from the blood by the glands. Upon the former head he shows, "that the blood consists of a simple fluid, in which swim corpuscles of various figures and magnitudes, and endued with different degrees of attractive force. Hence he concludes, that of such particles as the blood consists of must the fluids be composed which are drawn from it. This he proceeds to show to be not only possible, but actually so in several secretions. From this principle, that the blood consists of corpuscles of various figures and magnitudes, and endued with various degrees of attractive power, &c., he attempts to show the force of the air upon the blood in breathing, in order to demonstrate that by the pressure of the air the cohesion of the globules of the blood is dissolved. After this he shows how the union of the attractive particles is hindered near the heart, and that the particles which unite first, after the blood is thrown out of the great artery, must be such as have the strongest attractive force; and that such as have the least, must unite last; and all the intermediate ones according to their respective attractive power."² Besides this work, Keill published *Anatomy of the Human Body*, for the use of his pupils; and in 1717, *Essays on Several Parts of the Human Economy*. He appears to have given up public tuition, and some time previously to the publication of his last work to have established himself as a practising physician at Northampton, where he gained considerable fortune and reputation, and remained till his death, which took place in July 16, 1719, from a cancer in his mouth. He was buried in the church of St. Giles, where his brother John, to whom he left his property, erected a handsome monument to his memory.

KEILL, JOHN, an eminent mathematician and a natural philosopher, the elder brother of the preceding, was born in Edinburgh on the 1st of December, 1671.³ He received the rudiments of education in the schools of his native city, and remained at the Edinburgh university until he was enabled to take the degree of Master of Arts. He early displayed a genius and predilection for mathematics, and had the good fortune to study the science, along with the Newtonian system of philosophy, under Dr. Gregory. When, in the year 1694, Gregory went to try his fortune in England, Keill followed him, and contrived along with him to find admission to Oxford, where he held one of the Scottish exhibitions in Balliol College. Keill made his first appearance before the scientific world in his *Examination of Dr. Burnet's Theory of the Earth, together with some Remarks on Mr. Whiston's New Theory of the Earth*, published at Oxford in the year 1698. Any "theory of the earth," or account of its formation and state, in anticipation of the discovery of facts to support it, always formed a fruitful subject of debate; but Burnet's *Theory* afforded more ample field for censure than any other which pretended to support from the enlightened doctrines of modern philosophy. The grand outlines of his theory were of themselves sufficiently imaginative, and their effect was increased by the curious speculations with which he filled up the minor details of his edifice. He supposes the earth to have been originally a heterogeneous mass of fluid matter, of which the heavier portions fell to the centre, forming there a dense body, surrounded and coated by lighter bodies, while the water—the lightest of all the heterogeneous mass—remained on the outside of the whole. The air and other celest-

¹ *Phil. Trans.* xxv. 2, 247.

³ *Ibid.* 457.

tial fluids floated round this body: while between it and the water was gradually formed a coat of unctuous or oily matter, higher than water. Upon this unctuous coat certain impure particles which had at first been mingled with the air descended, and floating about covered the surface, forming a shell over the water, which became the crust of the earth. This crust was level and uniform, without hill or vale; so it remained for about sixteen centuries, until the heat of the sun having cracked it in divers places, the water rushed forth, causing the general deluge. This water found, however, a means of partially subsiding betwixt the broken masses of the crust, thus leaving the globe in the state of ocean, hill, and valley.

Keill, who, besides being a man of accurate science, was a person of clear good sense and critical acumen, saw clearly the evil done to science by the admission of suppositions which have a fully greater chance of being wrong than of being right, while the richness of the doctor's imagination, and the poetic beauty of his language and illustration, did not protect his principles from a subjection to the strict rules of logic. Keill's book is full of the clear argumentation of a man who is rather formed to correct and check the discoveries of others, than to allow his invention to stray so far as to make any of his own. He occasionally condescends to use demonstration, while, well knowing that there may be positions against which the gravity of an argument is misapplied, he makes very frequent use of sarcasm, a power of which he is an accomplished and apt handler. Most of the vigour of the attack is derived from the manner in which the different parts of the theory are found inconsistent with each other, without any very extensive reference to other authority. "After this fashion," says Keill, after giving an outline of Burnet's first formation of the earth, "has the theorist formed his antediluvian habitable world, which doth not much differ from the Cartesian method of making the earth: only Des Cartes, being somewhat wiser than the theorist, would not allow the outward crust, within whose bowels the waters were shut up, to be a habitable earth, knowing well that neither man nor beast could live long without water. But he made the crust first be broken, and the waters flow out, before he placed any inhabitants on it. Another small difference betwixt the two hypotheses is, that Monsieur Des Cartes never thought of making the exterior orb of oily liquids, which the theorist asserts to be absolutely necessary towards the formation of the crust; for if it were not, says he, for the oily liquor which swims upon the surface of the abyss, the particles of earth which fell through the air had sunk to the bottom, and had never formed the exterior orb of earth. But notwithstanding this, I believe it may be easily made evident (though neither of these systems is true), that the theorist's hypothesis is the worse of the two, which I will prove from his own concessions: for he has already owned that the oily liquor is much lighter than the watery orb. He has mentioned also that the terrestrial particles when falling from the air, if the orb were only water, would sink to the bottom; and therefore these particles must be heavier than water. From thence I think it does necessarily follow, that these terrestrial particles must also be heavier than the oily fluid, which is lighter than water, and therefore they will more easily descend through it than they did through water, it being well known that there are several bodies which will swim in water, but sink in oil."¹

Proceeding on such positions Keill destroys what

has been raised by his adversary, wisely substituting nothing in its stead, except what experiment and demonstration support; the general aim of the principles he espouses being that, excepting in so far as we know by experiment the operation of nature, we must take the cosmogony of the earth, either literally as we find it laid down in holy writ, or, admitting our inability to penetrate into its secrets, be content with what is afforded us by experience, demonstration, and rational or certain deduction. Whiston, in his *New Theory of the Earth, from its Original to the Consummation of all Things*, maintained that the Mosaic account of the creation did not give a philosophical account of the formation of the universe, but that it was merely intended, in the most simple and intelligible manner, to give a history of the formation of the globe we inhabit; that before being brought into existence as an inhabited world, it had been a comet, which being subject to perpetual reverses from heat to cold, became by the alternate congealing and melting of its surface, covered with a coat of heterogeneous matter or a chaos, within which the solid nucleus formed a great burning globe.

This great mass of matter, as the eccentricities of its orbit decreased, became more nearly circular, and the materials ranging themselves according to their gravities, assumed at the period of the "creation" the forms of earth, water, and air. If this theory does not possess any recommendation to our belief superior to that claimed by Burnet, its author had at least the art to found a greater number of his conclusions on experiments, and to deduce others in a less imaginative manner. Keill treats this adversary with more respect than he affords to Burnet, seldom proving his positions "impossible," and generally contenting himself with being sceptical; he allows that the author "has made greater discoveries, and proceeded on more philosophical principles, than all the theorists before him have done."

Keill's small work is often referred to as an authority by geologists and natural philosophers; it contains many experimental calculations, among which is that estimate of the depth of the sea on which Breislak in later times founded his celebrated calculation, that there never could have been a sufficient quantity of water in and about our globe to have kept the matter of it at any time in solution. It was considered by many that Keill had used the venerable Dr. Burnet, much his elder in years, a scholar, and a man esteemed for his private virtues, with too much asperity and unbecoming sarcasm. It appears that the respective theorists answered the attack, although in what manner we have been unable to discover.

In 1699 Keill published a rejoinder, entitled *An Examination of the Reflections on the Theory of the Earth, together with a Defence of the Remarks on Mr. Whiston's New Theory*. The defence of the *Theory* appears by no means to have infused into Keill a greater spirit of politeness. He proceeds with the impatience of a man of sense and knowledge interrupted, terminating with an advice to Burnet to study "numbers and magnitude, astronomy and statics, that," he continues, "he may be the better able to understand the force of my arguments against his *Theory*, after which I doubt not but that he will easily perceive its errors, and have the ingenuity to acknowledge them. But till then, all farther disputation between him and me must needs be vain and frivolous, since true reasoning on natural philosophy depends on such principles as are demonstrated in those sciences, the knowledge of which he has not yet attained."² To his other opponent, Whiston,

¹ *Examination*, 37, 38.

² *Examination of the Reflections*, 160.

Keill has in this work, probably owing to the manner in which he was answered, forgot his former courtesy, treating him with no more deference than he has used toward Burnet.

In 1700 Dr. Thomas Millington, Sedleian professor of natural philosophy in Oxford, on his appointment as physician in ordinary to the king, substituted Keill as his assistant to read his public lectures; and the term for enjoying the Scottish exhibition at Baliol College then expiring, he accepted an invitation from Dr. Aldrich, dean of Christ's Church, to reside there. As his master Gregory was the first who introduced the Newtonian philosophy to the universities, Keill himself possesses the reputation of having been the first to demonstrate its principles on experiment; a task he is said to have performed through machinery of his own invention, but of what description, or to what extent he proceeded in his proofs, we are not informed.

In 1701 Keill published his *Introductio ad Veram Physicam*, a useful and popular treatise on the Newtonian philosophy. It is considered as an excellent introduction to Sir Isaac Newton's *Principia*, and has frequently been reprinted in England, and in a French translation. About the year 1708 Keill was chosen a fellow of the Royal Society, and after his admission he published in the *Philosophical Transactions* a pretty lengthy paper, "in which the laws of attraction and other principles of physic are shown."¹ At this period the scientific world became disturbed by the dispute, which had assumed the aspect of a national question, whether Leibnitz formed his idea of the doctrine of fluxions from some unpublished discoveries of Sir Isaac Newton, and which of these two great men could properly be considered the inventor of that sublime addition to the power of the human intellect. In the *Acta Eruditorum*, published at Leipsic, it was maintained that Leibnitz was the sole inventor, all right on the part of Newton being denied. To this Keill answered in a paper which he communicated to the Royal Society, defending his friend without much regard to the accusations which he brought against his opponent.

In 1711 Leibnitz complained to the Royal Society that Keill had accused him of obtaining and publishing his knowledge in a manner not reputable to a philosopher, or even exactly consistent with honesty; he appealed to Sir Isaac himself as a witness of his integrity, and required that Keill should publicly disavow the offensive construction which might be applicable to his words. The Royal Society being appealed to as philosophical judges in the matter, appointed a committee to examine the papers and documents connected with the dispute, who did not find it difficult to produce a report rather unfavourable to the continental philosopher, bearing "that Mr. Leibnitz was in London in 1673, and kept a correspondence with Mr. Collins, by means of Mr. Oldenburgh, till September, 1676, when he returned from Paris to Hanover by way of London and Amsterdam; that it did not appear that M. Leibnitz knew anything of the differential calculus before his letter of the 21st June, 1677, which was a year after a copy of a letter wrote by Sir Isaac Newton, in the year 1672, had been sent to Paris to be communicated to him, and about four years after Mr. Collins began to communicate that letter to his correspondents; wherein the method of fluxions was sufficiently explained to let a man of his sagacity into the whole matter; and that Sir I. Newton had even invented his method before the year 1669, and of consequence fifteen years

before Mr. Leibnitz had given anything on the subject in the Leipsic Acts;" from which train of circumstances they concluded that Keill was justified in his imputations. The censure of the society, and the papers connected with it, were published apart from the *Transactions*, in 1712, under the title *Commercium Epistolicum de Analyti Promota*. For some time the philosopher appears not to have answered this array against him, until the Abbe Conti, in the year 1716, addressed him, calling on him, if he did not choose to answer Keill, at least to vindicate himself from the non-admission of his claim on the part of Newton;² and he just commenced the work of vindication at a period when death prevented him from completing it.

In the year 1709 Keill was appointed treasurer to the Palatines, and in performance of his duties attended them in their passage to New England. On his return, in 1710, he was appointed successor to Dr. Caswell, Savilian professor of astronomy at Oxford. At this period he again entered the field of controversy, in support of his friend Sir Isaac Newton, whose philosophy had been attacked on the foundation of Des Cartes's theory of a plenum; and he published in the *Philosophical Transactions* for 1713 a communication to the society on the rarity of matter and the tenuity of its composition.³ In this controversy he was, however, interrupted by his appointment to the situation of decipherer to the queen, and he was soon afterwards presented with the degree of Doctor of Medicine by the university of Oxford. About this period we find him gratefully remembered by that unfortunate scholar Simon Oakley, for having permitted him the use of the Savilian study.⁴

Keill, in the year 1717, took to himself a wife. The name of the lady who made him the happiest of men has not been preserved; but it is said he married her "for her singular accomplishments." In the *Gentleman's Magazine* for 1739 we find a curious Horatian ode addressed to Keill by the celebrated Anthony Alsop; its period of publication is some years after the death of both the parties, and there is no comment alluding to the date of its composition; but the circumstances mentioned show it to be a congratulatory epistle to Keill on his marriage. The ode is extremely spirited and not destitute of elegance; but whether from other motives, or the anxiety of the author to reach the familiar vivacity of the Roman lyric, he has treated his grave subject in a manner which would not now be considered very worthy of a divine, or to convey a pleasing compliment to a venerable professor. The subject was one of some delicacy to Alsop, who was then enduring a species of banishment, the consequence of a verdict obtained against him for breach of a contract of marriage; and whether from this circumstance, or his classical feelings, he has dwelt on the habits of his friend in a manner which would hardly fail to draw "damages" from a modern jury. In 1718 Keill published *Introductio ad Veram Astronomiam, seu Lectiones Astronomicæ*, a work which was reprinted in the year 1721, at which period, at the request of the Duchess of Chandos, he published a translation of this work in English, with emendations, under the title of *An Introduction to the True Astronomy; or, Astronomical Lectures read in the Astronomical School of the University of Oxford*.

² Published in the *Phil. Trans.* xxx. 924.

¹ "Epistola ad clar. Vir. Gulielmum Cockburn, Medicinæ Doctorem in qua Leges Attractionis Aliaque Physicæ Principia traduntur."—*Phil. Trans.* xxvi. 97.

The year in which he accomplished these literary labours was the last of his life; during the summer of 1721 he was seized with a violent fever, of which he died in the month of September, in the fiftieth year of his age. Besides the works we have mentioned, he published in 1715 an edition of Commandinus' *Euclid*, with additions.

KEITH, GEORGE, fifth Earl Marischal, founder of the Marischal College of Aberdeen. The period of this nobleman's birth is unknown; his father was William Lord Keith (eldest son of the fourth Earl Marischal), a person known in history as having been taken prisoner into England in 1558, and released for a ransom of £2000. This individual married Elizabeth Hay, daughter to the Earl of Errol, by whom, at his death in 1580, he left, besides the subject of our memoir, three sons and four daughters.¹ George succeeded his grandfather in the year 1581, and we find him towards the end of the year following doing his duty in parliament.² We are led to understand, that, previously to his succeeding to the title, he had spent some time among the seats of learning on the Continent. As with most men who have been remarkable in advanced life, it was recollected of him after his death, that in youth he showed an extreme desire for knowledge and a facility in its acquisition. We are informed that he studied at the King's College of Aberdeen,³ and that at the age of eighteen he was an adept in the Latin, Greek, and Hebrew languages, and in the studies of antiquities, history, and literature; when, discontented with the scope allowed in his own country, he resolved to study in France.⁴ On this journey it is said that he was courteously received by the Landgrave of Hesse (the chief among the descendants of that celebrated tribe of "Catti," from which the fabulous historians have traced the family of Keith), along with the other noble youths of the age. While he was accumulating knowledge, he did not forget the opportunities afforded him in France of perfecting himself in the knowledge of arms and the feats of athletic jugglery then in vogue. After some time Keith left France, preferring a residence in Geneva, with the illustrious Theodore Beza, by whom he was instructed in divinity, history, and the art of speaking. During his residence there an accident of a melancholy nature happened. His younger brother, William, who had accompanied him on his journey, and had, apparently with high promise of future eminence, shared in his studies, was killed in a tumult during an excursion into the country. His eminent master, along with Gaultier and Andrew Melville, have celebrated the memory and talents of this young man. Beza, in the dedication of his *Icones Virorum Doctrina et Pietate Illustrum* to King James, mentions with much satisfaction the circumstance of having been intrusted with the education of pupils so illustrious. After the death of his brother Keith left Geneva, and visited the courts of Europe, where his rank and great wealth admitted his making a considerable figure. It is said that even in this employment, presumed to be full of gaiety, he was a grave and accurate student: that he indulged in the splendour of courts more for the purpose of acquiring historical

knowledge than of pursuing pleasure, and that he travelled less for the purpose of recreation and variety, than for the acquisition of correct knowledge of the various countries of the world, having seldom seen a country of which he did not show his acquaintance by embodying his knowledge in a map.⁵ He returned to his native country after an absence of seven years. The Scottish peer who in the sixteenth century founded a university and encouraged learning must have been a man whose penetration and grasp of mind were very different from those of his colleagues in rank, yet he appears not to have been totally exempt from the barbarous habits and feelings of the day.

On the 8th of June, 1585, we find him obtaining a remission under the great seal, for "art and part" of the slaughter of his relative William Keith, apparent of Ludquhaim;⁶ and in 1595 he is charged to appear before the king and council as a person entertaining a deadly feud with the laird of Meldrum.⁷ Soon after his accession to the earldom the celebrated Raid of Ruthven took place, a political movement as to which it is difficult to discover his view, but with which his connection seems to have somewhat displeased the king. He was apparently not present at the "raid," nor does he appear to have approached so hot a political atmosphere until the king's escape from Falkland to St. Andrews, whither he repaired apparently as a neutral person; but he is represented as having retired to his own home in disgust, on the king changing the lenient measure he had at first proposed towards the rebels.⁸ The earl was a member of that parliament which, on the 19th of October, 1582, approved the acts of the conspirators, holding their proceedings as legal, and protecting their persons from punishment, by an act which was afterwards expunged from the statute-book.⁹ It is not without surprise, that, after such a measure, we find him acting as chancellor of the assize of peers, which, with considerable partiality in its proceedings, found the Earl of Gowrie guilty of treason on account of his share in the Raid of Ruthven.¹⁰ It can scarcely be doubted, that in these proceedings he was guilty of inconsistency: it is not likely that any one attended a parliament held under the auspices of the conspirators for the purpose of voting against them, and it was not customary for the crown to choose assizers who would acquit, while his having acted as chancellor leaves no doubt that he voted for a verdict of guilty! Charity can only palliate this tergiversation on the circumstance, that Gowrie had, in the interval between these events, been guilty of additional acts of disobedience.

After the singular proceedings on the part of James towards the court of Denmark in attempting a negotiation of marriage with the eldest daughter of Frederick II., which terminated in that monarch (not presuming the King of Scotland to be serious in his proposals) marrying his daughter to the Duke of Brunswick; the lover, disappointed of one daughter, was resolved to try more consistent plans for obtaining the other, and James proposed to send Lord Altry, uncle to the Earl Marischal, to Denmark, to make serious proposals to Frederick's second daughter, Anne. The disposition of the council of Scotland was such as prompted Altry, an old and infirm statesman, averse to engaging in the excitement of politics, to decline the high office, and his nephew, the Earl Marischal, showed a desire to

officiate in his stead. "Now the Earl Marischal," says Sir James Melville in his cautious manner, "was desirous to supply the place of his uncle, my lord of Altrý: and his majesty was content that he should be sent thither. Whereupon I took occasion to represent to his majesty that the said earl was very well qualified for that employment, and that he would go the better contented if he might have in commission with him some of his own friends and acquaintance. His majesty answered that it was his part to choose his own ambassadors; that the Earl Marischal should have the first place as a nobleman, but," continues Sir James with his usual complacency, "that he would repose the chief handling with the regent and council of Denmark upon me."¹ It is probable that the great wealth of the earl, who was then the richest nobleman in Scotland, was a cogent reason for appointing him to superintend an expensive expedition. It was the policy of Queen Elizabeth to object to the proposed alliance, and the privy-council of Scotland showed a disposition to accede to her wishes. In the meantime the tradesmen of Edinburgh, instigated, it is said, by the secret interference of James, took the matter into their hands, threatening the privy-council, and denouncing vengeance against Thirlestane, the chancellor, whom they looked upon as the chief agent of Elizabeth. James had made his resolution, and the earl was finally despatched to Denmark, along with the constable of Dundee, and Lord Andrew Keith, whom he had requested permission to take as an associate. Owing to the vacillating policy of James, "his power to conclude was so limited, and his commission so slender, that he was compelled to send back again my Lord Dingwall, either for a license to come home or for a sufficient power to conclude."² Dingwall found the king at Aberdeen, who, as the chancellor and most part of the council were absent, was now in a situation to give more ample powers. The storm which interrupted the voyage of the princess is well known as an amusing portion of Scottish history; in the meantime the chancellor, who was the deadly enemy of the Earl Marischal, had, from his opposition to the measure, sunk in the favour of James, and did not recover his former estimation without suffering the expense of procuring the handsome fast-sailing vessel, in which the monarch made that voyage to Denmark which has been considered so unaccountably inconsistent with his general character. We shall give, in the words of Sir James Melville, an account of the very characteristic squabbles which took place between the two rival peers at the court of Copenhagen. "The company who were with his majesty put him to great trouble to agree their continual janglings, strife, pride, and partialities. The Earl Marischal, by reason that he was an ancient earl, and had been first employed in this honourable commission, thought to have the first place next unto his majesty so long as he was there. The chancellor, by reason of his office, would needs have the pre-eminence. There were also contentions between him and the justice-clerk. The constable of Dundee and my Lord Dingwall could not agree about place. George Hume did quietly shoot out William Keith from his office of master of the wardrobe. At length they were all divided into two factions; the one for the Earl Marischal, the other for the chancellor, who was the stronger, because the king took his part; so that the chancellor triumphed."³ The munificence and great wealth of the earl prompted him to bear, in the first instance, the expense of the mission; he could not have done

a service more acceptable to his sovereign, and it appears to have finally reinstated him in favour. In 1592 the earl received a parliamentary ratification of his acts as concerned the mission, and was at the same time empowered to recover from a forfeited estate the expense he had incurred, stated as amounting to 3156 merks.⁴ Up to the commencement of the eighteenth century the debt was, however, unrecovered,⁵ and it is not probable that after that period it was ever paid.

In 1583 the earl was one of the commissioners appointed to superintend the "new erection" or alteration in management of the King's College of Aberdeen; and it is probable that the duties in which he was then engaged prompted him ten years afterwards to perform that act of enlightened munificence, which has perpetuated his name as the founder of Marischal College. The charter of the university was granted by the earl on the 2d April, 1593; it was approved of by the General Assembly of Dundee on the 24th of the same month, after having been submitted to the examination of a committee, and was ratified by parliament on the 21st of July following. The college was endowed to maintain a principal, three regent-professors, and six bursars. By the foundation the languages and sciences appointed to be taught were Greek, Hebrew, and Syriac, natural history, geometry, geography, chronology, and astronomy. In opposition to the principle previously pursued, by which each professor conducted a class of students through all the branches of knowledge taught in any university, the subjects taught in Marischal College were divided among separate masters, each of whom adhered to his peculiar branch—an excellent regulation, afterwards departed from, but resumed in the middle of the eighteenth century.⁶ Without descending to the particular benefits of this institution, the circumstance that many eminent names are connected with Marischal College, and that its small endowments have cultivated intellects which might have long lain unproductive, are sufficient of themselves to speak to the honour of its noble founder. There are 114 bursaries connected with the college, of the annual value of £1150. About seventy of these are open to competition. Two of them are of the annual value of £30 each, and are adjudged for excellence in mathematics to students who have studied that science for two sessions, and are held for two years. The bursaries range in value from £3 to £15 annually—the smallest paying the full fee of the possessor for the four years during which he remains at the university, and the larger frequently forming for a time the chief support of one or two individuals who would otherwise remain uneducated. They are carefully protected as the rewards of talent and labour, and held by those who gain them as their right, independently of the authority of the officials of the university. The ancient buildings of the university having fallen into decay, the foundation of a splendid new building in the Gothic style from designs by Mr. Archibald Simpson, architect, was laid with masonic honours by the Duke of Richmond, chancellor of the university, on the 18th of October, 1837. The builder's contract amounted to £21,420, of which sum £15,000, with interest thereon from 1826, was granted by government, the remainder

being raised by private subscription. The new buildings were completed in 1842. Several new chairs have been instituted. The average number of students for the succeeding twenty years was—in arts, 190; in divinity, 120; in law, 35; in medicine, 84.

Within the same year that Marischal College was founded, we find its patron engaged in other works of public utility. He granted a charter to Peterhead. And by the act 1593, c. 48, we find him empowered to exact a toll of twenty pence for every last of goods entering or leaving a harbour he had attached to that town.¹ At the same period the secret transactions with the court of Spain, of which some of the northern peers were suspected, and the discovery of those mysterious documents known by the name of "the Spanish blanks," created alarm in the nation and consternation at court; and by the same act of 1593 the Earl Marischal, as a trusty statesman, was empowered to act the part of king's commissioner in the shires of Kincardine, Aberdeen, and Banff, and to inquire into the conduct of the Earls of Errol, Huntly, Angus, and others.² A trust of still higher order was reposed in the earl in June 6th, 1609, when, by commission under the great seal, he was appointed lord high-commissioner to the parliament of Scotland.

In the year 1622, in the old age of a well-spent life, the earl felt his last illness come upon him, and he retired to his fortress of Dunnottar, where he is said to have borne his sickness with patience and religious resignation. Dr. Dun, one of the professors of his college, attended him as physician, and the disease for a time yielded to medicine, but finally relapsed.³ The latter days of this great and useful man do not appear to have been permitted to pass in domestic peace, and his death-bed was disturbed by the desertion and crime of an unfeeling wife. The circumstance to which we refer is one of a very singular nature; and as it is impossible at this period to trace all the motives from which it originated, we shall state it, almost verbatim, as it occurs in the criminal record, avoiding antiquated orthography. "On the 3d of March, 1624, Dame Margaret Ogilvie, countess-dowager of Marischal, along with her then husband, Sir Alexander Strauchane of Thornetoun, knight, and Robert Strauchan, doctor in physic, were accused before the high court of justiciary, of the ignoble crimes of masterful theft and stouthrief, in having stolen from the place of Benholm, belonging to the earl, certain jewels, silver plate, household stuff, gold, silver, and title-deeds, in October, 1622, a little before the said earl's decease." On the same day James Keith of Benholme was cited to answer for a similar crime, committed at the same time, and in the same place. The two cases are evidently connected together, and the minute in the latter provides us with the following inventory of articles stolen, which is an evidence of the magnificence and wealth of the earl, and an extraordinary feature in the transaction. Of Portugal ducats, and other species of foreign gold, to the avail of £26,000 or thereby; thirty-six dozen gold buttons; a rich jewel set with diamonds, which the deceased earl received as a gift when he was ambassador in Denmark, worth 6000 merks; the queen of Denmark's picture in gold, set about with rich diamonds, estimated at 5000 merks; a jasper stone for stemming of blood, estimated at 500 French crowns; a chain of "equall perle," wherein were 400 pearls great

and small; two chains of gold, of twenty-four ounce weight; another jewel of diamonds set in gold, worth 3000 merks; a great pair of bracelets, all set with diamonds, price thereof 500 crowns; the other pair of gold bracelets at £600 the pair; a turquois ring worth ten French crowns; a diamond set in a ring, worth twenty-eight French crowns, with a number of other small rings set with diamonds and other rich stones in gold, worth 300 French crowns; also 16,000 merks of silver and gold ready coined, which was within a green coffer; together with the whole tapestry, silver-work, bedding, goods, gear, and plenishing within the said place. The case, as regarded the countess and Sir Alexander and Dr. Strauchane, was postponed by a royal warrant to the 2d of July, from thence to the 27th of July, and from thence to the 8th of December, of which date no entry appearing, the lord-advocate seems to have been prevailed with to give up the pursuit; Keith of Benholme, who seems to have occupied, or been steward of, the house so strangely dilapidated, was outlawed for not appearing.⁴

The earl died at five o'clock on the morning of the 5th day of April, 1623, and a monument with a poetical inscription was erected to his memory. The funeral oration, so frequently referred to, was read at Marischal College, on the 30th of June, 1623, by Ogston, the professor of moral philosophy; it compares his death to an earthquake and sundry other prodigies of nature—heaps too great a load of virtues on his shoulders for mankind to bear with comfort, and in detailing the perfections of the dead Mæcenas, the author does not neglect those of the living Solomon. A book of *Tears* was also published to his memory, chiefly composed by Massy and Alexander Wedderburn.⁵ The lady already so equivocally mentioned was his second wife, a daughter of James, sixth Lord Ogilvie: he had previously married Margaret, daughter of Alexander, fifth Lord Hume,⁶ and by both he had several children.

KEITH, the HONOURABLE JAMES, commonly called Marshal Keith, the younger son of William, ninth Earl Marischal, and Lady Mary Drummond, daughter to the Earl of Perth, was born in the year 1696. His aptness for learning seems to have been very considerable, since he acquired in after-life a reputation for letters scarcely inferior to his military renown; a circumstance which was possibly in no small degree owing to his having had the good fortune to receive the rudiments of his education from the celebrated Bishop Keith, who was allied to his family by consanguinity, and who officiated as tutor to himself and his elder brother, the tenth Earl Marischal.

Mr. Keith was originally designed for the law, and with the view of making it his profession he was sent to Edinburgh to complete his studies. It was soon discovered, however, that he entertained a much stronger predilection for the camp than the bar;—he seems indeed to have been very early attached to the military profession. His language, when the subject happened at any time to be alluded to, was always full of martial enthusiasm, even while yet a mere stripling. "I have begun to study the law," he said, "in compliance with the desires of the Countess of Marischal (his mother), but commend me, gentlemen, to stand before the mouth of

a cannon for a few minutes; this either makes a man in an instant, or he dies gloriously in the field of battle." Such was the spirit in which the young soldier entered on his career of fame.

The Earl Marischal, elder brother of the subject of this memoir, was one of those Tory noblemen who signed the proclamation of George I. The party being disappointed in their hopes of office under the new dynasty, he returned in a state of high irritation to Scotland, and at York met his brother James, who was on his way to London for the purpose of asking a commission in the army. The two young men returned home together, burning with resentment, and on the commencement of the insurrection of 1715 they were incited at once by their own feelings, and by the advice of their mother, who was a Catholic, to declare for the Pretender. The meeting held by the Earl of Mar (who was their cousin), under the semblance of a hunting match, was attended by the two brothers, and they continued throughout the remainder of the campaign to act a bold and conspicuous part under that unfortunate leader. The immediate subject of this memoir is said to have manifested a degree of resolution and conduct which attracted much attention, and inspired hopes of his future fortune. On the final dispersion of the rebel army at Ruthven in Badenoch, they had no resource but to make the best of their way to a foreign land, where they might be safe from the consequences of their enterprise. They proceeded, in company with many other Lowland gentlemen, to the Western Isles, where they designed to wait till a vessel could be procured to convey them to France. While in the isles, where they were detained nearly a month, the fugitives were frequently alarmed by reports of their retreat having been discovered, and that an armament had been despatched in quest of them; and on one occasion they were informed that three frigates, with two battalions of foot on board, were within ten miles of them. They, however, were not molested. On the 20th of April a ship, which had been despatched from France for the purpose, arrived at the island on which they were concealed. Losing no time, they, along with about a hundred companions in misfortune, embarked on board of this vessel, and arrived in safety at St. Paul de Leon in Brittany, on the 12th of May, 1716. On their arrival at this port the greater part of them proceeded immediately to wait upon the Pretender, who was then at Avignon; the others, amongst whom was Keith, went straight to Paris, where the latter had at that time several relations residing. On reaching Paris Keith waited upon the queen-mother, by whom he was most graciously received, and who, amongst other flattering things, said, that she had heard of his good services in her son's cause, and that neither of them should ever forget it. Keith now proposed to the queen-mother to visit the king, by which he meant the Pretender, and asked her permission to do so. She, however, dissuaded him from taking this step, saying that he was yet but young, and had better remain in Paris and recommence his studies, and concluded by proposing to bear the charge of his future education. Notwithstanding this flattering reception, a whole month elapsed before Keith heard anything further from the queen-mother, and, in the meantime, he was reduced to great straits for want of money, living principally by selling horse-furniture, which military officers were at this period in the habit of carrying about with them, and which, being sometimes richly ornamented with silver, was a very valuable article. There were many friends of himself and his family in Paris, who would readily have afforded him any

pecuniary assistance he might have required, but, as he himself says in a MS. memoir of his life, written with his own hand, to which we have access, "I was then either so bashful, or so vain, that I would not own the want I was in." His wants, however, of this kind were soon amply provided for, and from various unlooked-for sources. The queen-mother at length sent him 1000 livres, and much about the same time a Parisian banker waited upon him, and informed him that he had instructions from Scotland to supply him with money, and an order from King James to pay him 200 crowns a year, with an apology for the smallness of the sum, as it was all that his (the king's) circumstances enabled him to do. Relieved now from his pecuniary difficulties, he betook himself to study, to which he devoted the whole of the remaining part of the year 1716, and a great part of the following year. Previous to this, and while pursuing his studies, he received a commission as colonel of horse in the service of the King of Sweden, who entertained a design of making a descent on Scotland in favour of King James. The project, however, was discovered long before it could be carried into execution, and thus both the intended invasion and Keith's commission fell to the ground. Another opportunity, although equally fruitless in its results, presented itself to the young soldier, now in his twentieth year, of pushing his fortune with his sword. This was the appearance in Paris of Peter I. Emperor of Russia. Keith made every effort to obtain admission into the service of that potentate, but without effect, he himself supposes on account of his not having employed the proper means. In the following year, 1718, learning that there was an intention on the part of Spain, similar to that which had been entertained by the King of Sweden, viz. to attempt the restoration of King James by invading Scotland—Keith and his brother the Earl Marischal set out for Madrid, with the view of offering their services in the proposed expedition. These were readily accepted, and the two brothers, after repeated interviews with Cardinal Alberoni, then prime minister of Spain, were furnished with instructions regarding the intended descent, and with means to carry that part of it which was intrusted to them into execution. By previous appointment Keith and his brother the Earl Marischal were met at Havre de Grace, the point at which they had fixed to embark for Scotland, by several of the Scottish leaders in the rising of 1715, who were still lurking about France. All of them having been advised of the undertaking, were furnished with commissions from the King of Spain, to apply equally to the Spanish forces which were to be sent after them, and to those which they should raise in the country.

The co-operation in this enterprise which they were led to expect was the landing in England of the Duke of Ormond with an army, which it was proposed should immediately take place. Two frigates, with Spanish troops on board, were also to follow them within a day or two, to land with them in Scotland, and enable them to commence their operations in that kingdom. On the 19th of March the expatriated chiefs embarked on board a small vessel of about twenty-five tons, and after encountering some stormy weather and running great risk from some English ships of war which they fell in with, they reached the island of Lewis on the 4th of April. They were soon afterwards joined by the two frigates, and a debarkation on the mainland was immediately determined upon. In the expectation of being joined by large bodies of Highlanders, they proposed to march forward to Inverness, from which they hoped to drive out the small force by which it was garrisoned.

The whole enterprise, however, hurried on to a disastrous conclusion. The Duke of Ormond's fleet was dispersed; the Highlanders refused to embark in the desperate undertaking; a very few only joining the invaders, and these showing little enthusiasm in the cause; and to complete their ruin, they were attacked and defeated by a body of troops which had been despatched to arrest their progress. They were, however, not so completely routed but that they were enabled to retire in partial order to the summit of some high grounds in the vicinity of the scene of action. Here a council of war was held during the night, in which it was resolved that the Spaniards should on the next day surrender themselves prisoners of war, that the Highlanders should disperse, and that the officers should each seek his safety in the best way he could.

Thus Keith found himself placed in exactly the same desperate circumstances in which he was after the rising of 1715—an outlawed fugitive, without means and without a home. After lurking some months in the Highlands, during the greater part of which, to add to his misfortunes, he was in bad health, he found his way to Peterhead, where he embarked for Holland, whither his brother had gone before him. Being here joined by the latter, they both proceeded to the Hague, and some time afterwards to Madrid. Here Keith's pecuniary difficulties became as pressing and infinitely more desperate than they were in Paris on his arrival there in 1715. "I was now," he says, "as the French have it, *au pie de la lettre sur le pavé*. I knew nobody and was known to none, and had not my good fortune brought Rear-admiral Cammock to Madrid, whom I had known formerly in Paris, I don't know what would have become of me; he immediately offered me his house and his table, both which I was glad to accept of." Thus shifting, together with the aid of some arrears of pay which he received from the King of Spain, he remained the greater part of the year 1720, and with the exception of some short absences, all the year 1721, at Madrid. He then removed to Paris, where he lived for the next three or four years, receiving the pay of a Spanish colonel, but without being attached to any regiment. At the end of this period Keith again returned to Spain, and was employed in active service up to the year 1728. Thinking himself, however, rather overlooked, he in this year addressed a letter to the king, soliciting his patronage, and requesting that he might be appointed to the command of the first Irish regiment which should become vacant. The answer of his majesty to this application was, that so soon as he knew that he was a Roman Catholic he should not only have what he asked, but that his future fortunes should be cared for. Finding all hopes of promotion in the Spanish service thus cut off on account of his religious belief, Keith solicited a recommendation from his Spanish majesty to the court of Russia, where he now determined to try his fortunes. The recommendation which he sought was at once granted and forwarded to the Emperor of Russia, who soon after intimated to him his admission into his service as a major-general. On Keith's leaving Madrid for Moscow the King of Spain presented him with a *douceur* of 1000 crowns, and soon after his arrival in Russia he was promoted to the command of a regiment of guards, an appointment of great trust, and which had hitherto been bestowed on none but especial favourites of the sovereign. He was further named one of three inspectors of army details, and awarded as his department the frontier of Asia, with the country on both sides of the Volga and Don, together with part of the frontier of Poland. About this time

one of his early instructors, a Mr. Morton, hearing of his good fortune, wrote to him a letter of congratulation on his prosperity. The general's reply partook of his nature; it was kind and unaffected, "I am a true Scotsman indeed," he said amongst other obliging things, "wise behind the hand; for had I been more careful to imbibe the excellent instructions I received under your inspection, I had still made a better figure in the world." Hitherto the general, though he had proven himself at once a zealous and an able officer in the discharge of his military duties, had had no opportunity of exhibiting his talents for active warfare. Such an opportunity, however, at length offered. On the death of the King of Poland, that unhappy kingdom was entered by a Russian army to overawe, or rather control, the election of a new king. On this occasion the general was despatched into Poland with six battalions of foot, 600 dragoons, and 4000 Cossacks. While on this service he was ordered by the commander-in-chief, Prince Schah-olskoi, to ravage the country. With a feeling of humanity and in a spirit of honour which reflects much credit on his character both as a soldier and a man, he endeavoured to evade the painful and, as he felt it, dishonourable duty. Finding that no dictates of humanity would weigh with the commander-in-chief, he tried the effects of interested considerations; representing to him, that if the system of devastation was continued, not only would the inhabitants, but the Russian army also, be reduced to a state of absolute starvation. This had the desired effect. The general was immediately ordered to desist from further spoliation. During the whole of this war the general conducted himself with a degree of judgment and gallantry, and in short, discovered throughout such a possession of the best and most valuable qualities of the soldier, as now ranked him indisputably amongst the first captains of the age. He was severely wounded in the knee in this service at Ocrakow. The injury was of so serious a nature that the Russian surgeons recommended that the wounded limb should be amputated, and the general at once gave his consent to the operation being performed. But his brother, who had gone to visit him on this occasion, would not listen to the proposal. "I hope," he said, "James has yet more to do with that leg, and I will not part with it so easily, at least not until I have the best advice in Europe." In the spirit of brotherly affection which these expressions bespeak, he immediately removed the general to Paris, to procure the advice of the surgical skill of that city, and the result was highly favourable. The French surgeons, doing what those of Russia had neglected, laid open the general's knee, and extracted some pieces of cloth which had been driven into the wound by the shot, and had all along prevented that cure which was now soon effected.

The military fame of General Keith was now spread over all Europe, and had attracted in a particular manner the notice of the warlike Frederick of Prussia, who lost no time in inviting him into his service, offering him the rank of a field-marshal and the governorship of Berlin, with ample means to support the dignity of these situations. These offers were too tempting to be refused. The general accepted them, and immediately proceeded to the Prussian court. His affable manners and military genius soon won him the personal esteem of his new master, who not only admitted but invited him to the most familiar intercourse, travelled with him throughout his own dominions and those of the neighbouring states, and acknowledged him as an adviser in matters of military business, and as his

companion in his hours of relaxation. For some time after his arrival in Prussia the marshal enjoyed a respite from military service, Frederick happening then to be, we cannot say at peace, but not at actual war with any of the European powers. This leisure he devoted to literary pursuits, entering into and maintaining a correspondence with some of the most eminent politicians and philosophers of the day, all of whom bear testimony to the great talent and ability with which he discussed the various subjects on which he wrote, and not the smallest portion of their praise was bestowed upon the elegance and felicity of language which his correspondence exhibited.

Frederick's, however, was not a service in which much repose of this kind could be expected. He, of whom it is said, that he looked upon peace only as a preparation for war, was not likely either to remain long idle himself, or to permit such a man as Marshal Keith to be so. The outrageous conduct of Frederick in repeated instances had long given great umbrage to many of the European powers, but none of them had dared to come to open hostilities with him. At length, however, they fell upon the plan of combining their efforts for the chastisement of the warlike monarch, whom none of them would venture to face singly.

Austria, Russia, Germany, and France all took the field against the Prussian monarch. During the vicissitudes and operations which ensued, in attacking at one time, and resisting at another, the various efforts of his numerous enemies, Frederick intrusted the most important tasks, next to those which he himself assumed, to Marshal Keith, whose military talents and sound judgment he found during the arduous struggle which followed had not been overrated. When summoned by the Prince of Saxe-Hildburg to surrender Leipsic, which Frederick had left him to defend with 8000 men, the gallant soldier, then upwards of sixty years of age, replied to the messenger, "Let your master know that I am by birth a Scotsman, by inclination as well as duty a Prussian, and shall defend the town in such a manner that neither the country which gave me birth, nor that which has adopted me, shall be ashamed of me. The king, my master, has ordered me to defend it to the last extremity, and he shall be obeyed." Early on the following morning the marshal summoned the magistrates of the town together, told them of the communication which he had from the enemy, and advised them to wait upon the prince, and beg of him, for their own sakes and that of the inhabitants in general, to refrain from proceeding to extremities against the city; "for," said he, with a tact which showed the consummate soldier, "if he proceeds in this resolution, I will myself begin to set fire to the suburbs, and if that be not sufficient to oblige the enemy to desist from his enterprise, I will go further, and not spare even the city itself;" and with many expressions of reluctance to have recourse to such dreadful measures, to which he said necessity alone could compel him, he dismissed the terrified citizens, who instantly despatched a deputation to wait upon the prince. All, however, they could obtain from the latter was a modification of the terms of the original summons. Another was sent, in which the Prussians were offered the liberty of marching out of the town without molestation. This summons Marshal Keith rejected with the same determination as the former, to the great provocation of the prince, who, in his resentment at the tone of defiance assumed by the Prussian commander, declared that if the latter carried his threat into execution regarding the burning of the town, he would lay Berlin or

Potsdam in ashes. The extremities which were thus threatened on both sides were, however, prevented by the approach of the Prussian monarch, who arrived in the neighbourhood of Leipsic with a large force, and averted the destruction of the city by bringing on the celebrated battle of Rosbach, in which he was completely victorious. Soon after this Marshal Keith marched into Bohemia with an army, and laid that kingdom under contribution, having previously dislodged the Austrians from the mountains of Saxony, where they had been strongly posted. The brilliant career, however, of this soldier of fortune was now about to close for ever; the death which became him awaited him, and was close at hand.

Frederick had taken up a position in the village of Hochkirchen, which he was particularly desirous of retaining, and which the enemy were equally desirous of possessing. The consequence was, that this point was attacked during the night following its first occupation. On the first alarm of the enemy's motions, Marshal Keith mounted his horse, and hastily collecting what troops were in his immediate neighbourhood, marched towards the village. On arriving there he found it already in the hands of the enemy. Charging, however, at the head of his troops, he drove them from the position. Fresh bodies of the enemy came up, and the marshal was in turn forced to retire. Again he returned to the combat, leading on his men, and cheering them as he advanced; and again he cleared the village of the enemy. Determined on possession of the position, the latter once more returned with increased numbers, until latterly the whole flower of the Austrian army were concentrated on this sanguinary spot, defended by a handful of Prussians. At eight o'clock in the morning, and while the combat was yet at the hottest, although it had now lasted several hours, the marshal received a severe and dangerous wound. He refused, however, to quit the field, but continued to conduct the desperate encounter with unabated enthusiasm and gallantry. At nine o'clock, an hour after he had received his first wound, a second shot passed through his breast, and instantly stretched him lifeless on the ground. His body was stripped by the Austrians, who had now driven the Prussians from the field, and was thus left exposed until it was recognized by Count Lasci, who had been one of his pupils in the art of war. That nobleman immediately gave orders for its interment; but this having been done with little reverence, it was shortly afterwards taken up by the curate of Hochkirchen, and again committed to the earth with every mark of decency and respect. The remains of the marshal were, by the special orders of the king, finally removed to Berlin, and buried there with all the honours which a nation and a great monarch could pay to splendid talent and great moral worth.

If anything were wanting to complete the illustrious character of this great man, it is to be found in the circumstance of his death having been nearly as much lamented by the Austrians, then the enemies of Prussia, as by the Prussians themselves. His humanity was ever on the alert to protect even those against whom he fought from any unnecessary violence, and the Austrians had, in a thousand instances, been indebted to this ennobling trait in a character admirably calculated in all its parts to gain the esteem and admiration of mankind. Marshal Keith died in the sixty-third year of his age. He was never married, but to whatever chance this was owing, it does not appear to have proceeded from any want of susceptibility, for, while in Paris in 1718, on being first urged by some of his friends to offer his services to the court of Spain, which he was then informed

meditated some designs on Sicily, he says, "But I was then too much in love to think of quitting Paris, and, although my friends forced me to take some steps towards it, yet I managed it so slowly, that I set out only in the end of that year; and had not my mistress and I quarrelled, and that other affairs came to concern me more than the conquest of Sicily did, it's probable I had lost many years of my time to very little purpose—so much was I taken up with my passion." Of the final result of this attachment we are not informed; but it does not appear that he ever formed another.

Some years after his death, a monument was erected in the churchyard of Hochkirchen to the memory of the marshal, by his relative Sir Robert Murray Keith. It bore the following inscription, composed by the celebrated Metastasio:

Jacobo Keith,
Guilielmi Comitiss Marescelli Hered.
Regni Scotiæ,
Et Mariss Drummond, Filio,
Frederici Borussia Regis
Summo Exercitus Prefecto;
Vir.
Antiquis Moribus et Militari Virtute claro,
Qui,
Dum in prælio sum præsul hinc,
Inclinatam suorum aciem
Mente, Manu, Voce, et Exemplo
Restituebat,
Pugnans ut Heros decet,
Occubuit,
Anno 1758, Mense Oct.

The Earl Marischal, elder brother of Marshal Keith, also deserves some notice in the present work, as an enlightened and distinguished man. Attainted for his share in the insurrection of 1715, his fate continued for some time identified with that of his younger brother; till, in 1750, he was appointed by Frederick II. of Prussia as ambassador extraordinary to the court of France. He afterwards served the same sovereign as ambassador to the court of Spain, and in this capacity had an opportunity of reconciling himself to his native court. Having discovered the secret of the family compact, by which the different princes of the house of Bourbon had bound themselves to assist each other, he communicated that important intelligence through Mr. Pitt to the British government, to whom it was of the highest importance. The consequence was a pardon extended by the king to Earl Marischal, and an act of parliament to enable him to inherit property in Great Britain.

After this happy event he proceeded to London, and was introduced to the king (George II.), who received him very graciously. It afterwards was discovered that, by this movement, he escaped a very considerable danger, for within thirty-six hours of his departure from Madrid, notice was received by that court of the communication he had made. The reconciliation of the earl to the house of Brunswick appears to have given great offence to the relics of the Jacobite party, who, it is needless to mention, still retained all their pristine antipathy to that family. Among the papers of Bishop Forbes of Leith is an anecdote to the following effect: "It had been a constant practice in the parish of Langside in Aberdeenshire, to have bonfires, and even to ring the parish bell, on the 2d of April, o.s., the birthday of Earl Marischal. On Thursday the 12th February, being a general fast throughout Scotland, when the bellman was ringing the first bell, the news came to Langside containing the accounts of the Earl Marischal having taken the oaths at London; and at that very instant the said bell rent from the top downwards, and then across near the mouth, and that soon after the bell had begun to ring.

"A gentleman," continues this curious memorial, "walking in his garden, about a quarter of a mile from the church of Langside, asked a man passing by, what the matter was with the bell in stopping so suddenly. The answer being that she was rent, 'Well,' said the gentleman, 'do you know what the bell says by that?—even, the deil a cheep mair sall I speak for you, Earl Marischal!'"¹

The earl resided in Britain for several years, purchased back some of his family property, and intended finally to settle for the remainder of his life in Scotland. The King of Prussia, however, pressed him so warmly to return to his dominions—saying, in one of his letters, "If I had a fleet, I would come and carry you off by force,"—that he once more became an exile from his native land. He spent the rest of his life in Prussia, on the most intimate terms of friendship with its extraordinary monarch, and the enjoyment of every pleasure that a cultivated mind and a virtuous course of life can secure for mortals. Frederick had discovered that the earl was sincerely attached to his person, and he therefore bestowed upon him in return more of his own friendship than was ever experienced by any other individual. The earl was also the friend and correspondent of Hume and other literary men of his own country, besides the European literati in general. He died at Potsdam, May 28, 1778, in the eighty-sixth year of his age—two days before Voltaire, who had nearly attained the same age, expired at Paris. An *Éloge de My-lord Marischal*, by the celebrated D'Alembert, was published at Berlin in 1779.

KEITH, ROBERT, commonly called Bishop Keith, an eminent scholar and antiquary, was born at Uras in Kincardineshire, February 7, 1681. He was named Robert after the Viscount of Arbutnot, who had been suckled by his mother. His father, Alexander Keith, having died while he was only two years of age, the care of his education devolved upon his mother, a most exemplary woman, who spared no pains and no expense within the reach of a very limited income, to inculcate those lessons of virtue and religion, and that knowledge of letters, which afterwards procured her son so much honourable distinction.

The bishop seems to have entertained, during his whole life, a deep sense of the obligations under which he lay to this amiable parent, and to have taken great pleasure in expressing it. Though in but indifferent circumstances in the early period of his life, he was yet closely related to one of the most ancient and noble families in the kingdom, being lineally descended from Alexander, the youngest son of William, third Earl Marischal.

When he had attained the age of seven years his mother removed with him to Aberdeen, where he obtained the earlier part of his education. In 1703 he procured the situation of tutor to the young Lord Keith and his brother, and in this employment he remained till 1710, when he was admitted to the order of deacons in the Scottish Episcopal Church, by Haliburton, (titular) Bishop of Aberdeen; and in November following became domestic chaplain to Charles Earl of Errol, and his mother the countess. Two years after, he accompanied his lordship to the baths of Aix-la-Chapelle, and had thus an opportunity of visiting some of the most celebrated towns and cities on the Continent. Leaving the earl at Aix-la-Chapelle, he returned to England and landed at Dover, where he was compelled to remain for

¹ The worthy bishop gives this anecdote as one related at his table by the celebrated Mr. John Skinner, Episcopal minister at Langside.

several months in consequence of a severe illness, brought on by exposure during a violent storm which he had encountered in crossing the Channel. On recovering sufficiently to enable him to undergo the fatigue of travelling, he set out for Edinburgh, where he arrived in February, 1713. He was shortly after this invited by a congregation of Scottish Episcopalians in that city to become their minister, and was accordingly raised to the priesthood by Bishop Haliburton, on the 26th May, in the year just named. His talents and learning had already attracted some notice, and had procured for him a considerable degree of influence in the church to which he belonged, and of which he was always a steady, zealous, but rational supporter; for although firmly attached to the faith in which he was educated, he was yet extremely liberal and tolerant in his religious sentiments. In June, 1727, he was raised to the episcopate, and was consecrated in Edinburgh by Bishops Miller, Rattray, and Gadderar. He was, at the same time, intrusted with the superintendence of the district of Caithness, Orkney, and the Isles, and in 1733 was preferred to that of Fife.

For upwards of twenty years after this period Bishop Keith continued to exercise his duties in Edinburgh, filling a respectable, if not a dignified, place in society, and employing his leisure, it would appear, chiefly in the compilation of those historical works which have transmitted his name to posterity. In a manuscript memoir by Mr. Murray of Broughton, secretary to Prince Charles Stuart—which the present writer has perused—it is clearly signified that, previous to the insurrection of 1745, the bishop corresponded on subjects relating to his depressed and suffering communion with the court of the Pretender, and that the latter personage, as the supposed head of a supposed church, gave the *congé d'élire* necessary for the election of individuals to exercise the episcopal office.

The first historical work published by the bishop appeared in 1734, in a folio form, under the title of a "*History of the Affairs of Church and State in Scotland*, from the Beginning of the Reformation in the Reign of James V. to the Retreat of Queen Mary into England." Though tinged here and there with high-church prejudices, the original narrative is a useful and, upon the whole, a candid record of a very controverted part of our history: while the state documents quoted in the body of the work and at its close have proved of incalculable service to every later writer upon the same subject. The list of subscribers prefixed to this work is highly curious, as being an almost complete muster-roll of the Jacobite nobility and gentry of the period: among the rest is the famous Rob Roy. In 1755 the bishop published his well-known *Catalogue of Scottish Bishops*, which has also been a mine of valuable knowledge to later writers. The latter years of this venerable person appear to have been spent at a villa called Bonnyhaugh, on the banks of the Water of Leith, which belonged to himself. Here he died on the 20th of January, 1757, in the seventy-sixth year of his age. He was buried in the Canongate Churchyard, a few feet from the wall on the western side, where a plain tombstone, inscribed simply with his name, has since been erected.

Besides his eminent qualifications as an historian and antiquary, the subject of this notice possessed those of an acute and painstaking genealogist, a study to which he was probably directed by the high value which he always attached to the dignity of his own descent, and which he was at much pains to establish. An instance of his tenacity in this particular, and of his peculiar talent for genealogical research, was ex-

hibited in a dispute into which he entered with Mr. Keith of Ravelstone, on the subject of the comparative proximity of their several families to the house of the Earls Marischal. On that occasion he printed a "Vindication of Mr. Robert Keith, and of his young grand-nephew Alexander Keith, from the unfriendly representation of Mr. Alexander Keith, jun., of Ravelstone." In this vindication he not only succeeded in establishing his superior claims to the particular honour in dispute, but showed that he was also related to the Dukes of Douglas and Hamilton. His reason for being at so much pains in vindicating the nobility of his descent is thus spoken of in the document above alluded to: "For although he himself (he speaks in the third person), now in the close of the seventieth year of his age, and having only one daughter, might be pretty indifferent about anything of this nature, yet he suspects his young grand-nephews (for there are no less than three of them, Alexander, Robert, and John), when they came of age, might reproach the memory of their uncle, and justly perhaps, for his not endeavouring to set their birth at right against so flagrant an attack, seeing the one was capable, and the others might not have the same means of knowing, or the same abilities to perform it." The good bishop seems to have been no hoarder of money, for at his death he left only £450, while his colleague and assistant died worth £3000.

KEITH, SIR ROBERT MURRAY, K.B. In this distinguished personage we have presented before us the rare character of a high-minded, honourable, upright diplomatist. But, what is perhaps equally rare, he was a *Scottish* diplomatist. That our country, which has produced so many distinguished men, should have left such a profitable walk almost unoccupied, and that a people so accustomed to veil their feelings, so habituated to self-command, and so shrewd and penetrating, should yet be able to produce so few names illustrious for diplomatic talent, is one of those inexplicable anomalies that stand out so strongly in the national character, to the great perplexity of ethnical psychologists. It classes with the fact that the Scot, who at any moment is ready to die for his country, is equally prompt to quit it, and in no great hurry to return to it.

That branch of the Keiths to which the subject of this memoir belonged was descended from the Keiths of Craig, in Kincardineshire. He was the eldest son of General Sir Robert Keith, who for some time was ambassador at the courts of Vienna and St. Petersburg; his mother was a daughter of Sir William Cunningham, of Caprington; his sister, Mrs. Anne Murray Keith, the intimate and esteemed friend of Sir Walter Scott, was beautifully delineated by the great novelist, under the name of Mrs. Bethune Balfour, in the *Chronicles of the Canongate*. Robert was born on the 20th of September, 1730. His father being much abroad, employed in his public duties, and his mother having died when he had only reached the early age of eleven, the youth was thus left in a great measure to his own management; but even already the maternal care had cultivated that high moral sense and delicacy of feeling which his character afterwards exhibited; while his father's letters prepared him for those diplomatic employments by which he was to secure for himself an honoured name in the political world. The education of Robert Murray Keith was for some time conducted at the high-school of Edinburgh, and this he turned to good account in after years, by using Latin, which he could do fluently, both by speech and writing, in various parts of Europe, when

his communications could not be so fitly expressed in ordinary language. At the age of sixteen he was removed to an academy in London; and as the military profession was at this time his choice, he studied riding the great horse, fencing, French, fortification, music, and drawing. All this was enough for an accomplished soldier, but to these he added a thorough knowledge of modern languages, at that time too much neglected in education; so that besides French, he had a complete command of Dutch, German, and Italian—a circle which he afterwards widened so greatly, that among his studies he was able to specify his “ten tongues” as part of his daily employment.

On completing his education, Robert Murray Keith received a commission in a Highland regiment employed in the Dutch service, and known by the name of the Scotch-Dutch, where he continued till the age of twenty-two, and had attained the rank of captain when the regiment was disbanded. He then entered the service of one of the German states, but found it the roughest of all military schools, on account of the hardships and privations that attended it. Among the other necessities of life, the article of fuel was dealt out with such a sparing hand, that he was obliged, in the depth of winter, to keep constant watch over it—a necessity that brought upon him the habit of sleep-walking. With all this, the chance of military glory as a recompense was somewhat uncertain, for he was attached as adjutant-general and secretary to Lord George Sackville, who commanded the English contingent of the allied army under Prince Ferdinand of Brunswick. Sackville found it necessary to resign; but Keith, through the influence of his father, was soon appointed to serve in a new Highland corps, raised for the war in Germany, with the rank of major-commandant. He was now one of the leaders of a body of men from whom much was expected, and who by no means disappointed the expectation. Although these Celts were raw undisciplined lads, fresh from their native hills, they were marched into the fire only the third day after their arrival; and under Keith they attacked a village sword in hand, and drove out of it a regiment of veteran dragoons with great slaughter. In consequence of their gallant behaviour more Highlanders were sent to Germany, and well did they justify the wise policy of Chatham in employing them, as well as the declaration of the Prince of Brunswick, that “they did wonders.” Such was the case throughout the campaign of 1760, and at the battle of Fellinghausen, in July, 1761. On this occasion the claymore was more than a match for the bayonets of the choicest troops of France, whom the Highlanders defeated with great loss; while their kindness to the wounded and prisoners after the battle, if possible, surpassed their valour in the field. In fact, the celebrated but diminutive Marshal Broglie, who commanded against them, and contrasted their prowess with their light, short, spare figures, declared, when the fight was over, that “he once wished he were a man six feet high, but now he was reconciled to his size, since he had seen the wonders performed by the little mountaineers.”

Soon after Keith's military career terminated, for the Highland corps was disbanded in 1763. After a year spent in Paris, where his manners and accomplishments made him a universal favourite, he returned to London, and was promoted to the rank of colonel. Four years were spent in the metropolis, when, in 1769, Colonel Murray Keith, whose high civil capacities and aptitude for business had been discerned by Mr. Pitt, was appointed British envoy

to the court of Saxony. To Dresden he accordingly repaired, where he appears to have had little occupation besides that of keeping open the friendly relationship between that country and Great Britain, and playing a conciliatory part with all the gay assemblies in which Dresden abounded. His letters at this period give an amusing sketch of the nature of his duties, and the manner in which they were performed:—“I'll give you a little sketch of my way of living.—Morning, *eight o'clock*: Dish of coffee, half a basin of tea, *billets-doux*, embroiderers, toymen, and tailors. *Ten*: Business of Europe, with a little music now and then, *pour égayer les affaires*. *Twelve*: *Devoirs* at one or other of the courts (for we have three or four), from thence to fine ladies, toilettes, and tender things. *Two*: dine in public—three courses and a dessert; venture upon half a glass of *pure wine*, to exhilarate the spirits without hurting the complexion. *Four*: Rendezvous, sly visits, declarations, *éclaircissemens*, &c. &c. *Six*: Politics, philosophy, and whist. *Seven*: Opera, *appartement*, or private party; a world of business, jealousies, fears, poutings, &c. After settling all these jarring interests, play a single rubber of whist, *en attendant le souper*. *Ten*: Pick the wing of a partridge, *propos galans*, scandal, and *petits chansons*. Crown the feast with a bumper of Burgundy from the fairest hand, and at *twelve* steal away mysteriously *home to bed*.” “And is this the way a kingdom may be ruled?” exclaims the disappointed reader. But why not, if peace instead of war is to be the order of the day? From this drolling sketch it will be evident that Colonel Keith always kept his head cool for action, whatever might occur, and that, too, in a country where dissipation and deep drinking, even in courtly halls, made the latter half of the day little better than a nullity.

If Keith secretly felt that he occupied an unworthy position, from having so little to do, he was soon cured of this uneasiness by being transferred to the court of Denmark. At Copenhagen the whole scene was changed. There foreign influence was jealously watched, and foreign diplomatists held at a wary distance. The gay parties, in which public measures could be openly and frankly discussed, were discountenanced; and so completely was the society of the court broken into circles, that even at the theatre they were obliged to confine themselves to their separate places. “Those who sit two boxes from me,” he writes, “might as well be in Norway, for any manner of communication I can have with them. It is really ridiculous to see how the world is parcelled out here into no less than nine classes, six of whom I must never encounter without horror.” All this, however, he endured and surmounted with his usual tact, and performed the duties of his mission to the satisfaction of his own court, but without exciting the suspicion of the Danish government. It was much, indeed, that a heart so open and a disposition so buoyant should have maintained this tranquillity in such a freezing atmosphere; and therefore, while he waited for orders, and fulfilled them punctually when sent, he thus expressed his private feelings:—“In the meantime I heartily consign that old harridan Etiquette, with all her trumpery, to the lowest underling of all possible devils.”

A fatal necessity soon occurred for Keith to give all these jealous court restrictions to the winds, and hurl defiance at the very throne of Denmark. To understand this, the most important event of his life, we must premise that the Danish sovereign, Christian VII., had for his queen, Matilda, sister of George III. But Christian, unfortunately, was a strange compound of idiot and madman, such as

Europe had scarcely seen even in the worst days of the Roman empire. In the course of his travels he had picked up a certain physician, Struensee, whom he ennobled and appointed to the first place in the government; and so implicitly did he put trust in his favourite, that every measure, whether of court or kingdom, was wholly regulated by the parvenu Count Struensee. It is easy to imagine with what feelings both nobles and people regarded his elevation; but as if their united dislike had been insufficient for the ruin of the luckless stranger, Christian himself aggravated their hatred of the man of his choice by the incredible fooleries in which it was his pleasure to indulge. Among these, one of his royal pastimes was to go down on all fours, and play the part of a horse!—and not content to top his part by gambolling and neighing, he must needs also complete the resemblance by receiving a due portion of the kicks and cuffs too often bestowed upon the nobler animal which he aspired to imitate. Count Brandt, the friend of Struensee, who was compelled to play the part of the surly groom on this occasion, by being threatened with the punishment of a traitor if he disobeyed, was afterwards beheaded for his compliance. Such was the husband of Matilda! But this was not the utmost of her calamity; for an ambitious and unprincipled queen-mother was also dominant in the court of Copenhagen; one who had studiously perverted poor Christian both in mind and body from infancy, that she might pave the way for the succession of her son, Prince Frederick, and was now bent upon the ruin of Matilda, as one by whom her aims were likely to be defeated. It was by this *Até* that the court was set against the young and beautiful queen, and her husband, who really loved her, withdrawn from her society; and when Matilda, thus forsaken, was obliged in self-defence to form a coalition with the powerful minister, it was foully insinuated that their meetings were for the purpose of adulterous intercourse. She was thus traduced, that she might be the more easily and effectually destroyed. Even the high talents which Struensee undoubtedly possessed, and his superior accomplishments and manners, were quoted to confirm the accusation. To seize the queen and minister was now the aim of their enemies; but although several schemes were laid for the purpose, they were always defeated by accident. At length a masked ball was given one night at the palace; and amidst the rest and security that usually follow a revel, the conspirators entered the king's bed-chamber, and by frightening him with the report of a conspiracy against his life, obtained from him an order for the instant arrest of the queen, Count Struensee, and their followers. Struensee and Brandt were seized in their beds, and hurried off to the citadel of Copenhagen; Matilda, in her night-dress, was apprehended in her own bed-chamber, and after an agonizing struggle to gain access to the king, which was prevented by the guards with their crossed muskets, was incarcerated in the fortress of Cronenburg. On the following morning the streets of Copenhagen rang with huzzas of mob loyalty, and in the evening they were lighted with an illumination. The people were taught that the queen was not only an adulteress, but had attempted to poison her husband; and while the churches were filled with thanksgiving for the preservation of such a valuable sovereign, it was easy for the senate, without waiting the ceremony of trial, to declare her guilty of both charges.

It was now the season for Colonel Keith to despise etiquette, and dare the utmost. Hitherto he had seen and lamented the situation of his sovereign's sister; but the jealousy with which the proceedings

of the court were guarded had prevented his interference, and the astounding explosion had taken him, as it did every one else but the queen-mother and her agents, at unawares. Alone, amidst an excited and infuriated capital, he forced his way into the council where the fate of the queen was at issue, and denounced war against Denmark if a single hair of her head was touched. The British fleet was to be immediately summoned to Copenhagen, and the bombardment of the capital commenced. It was an act worthy of the proudest days of Rome, when her ambassador drew a line upon the sand, and commanded the king of Egypt not to cross it until he had decided whether he would have peace or war. After having delivered this stern declaration before the council, upon whom it fell like a thunderbolt, Keith despatched a messenger to his own court with an account of the proceedings, and a request for further orders, and till these should arrive he locked up himself and his household, and remained for four weeks in a state of quarantine, or rather of siege and defiance. At the end of that time the expected packet arrived, and on eagerly opening it the insignia of the order of the Bath fell at his feet. It had been inclosed by the king's own hands, to mark his sense of Sir Robert's heroic conduct, and was accompanied with a command to invest himself forthwith, and appear at the Danish court. It was thus seen that the ambassador's menace was no idle threat, but would be made good, if need were, by a British armament. Brandt and his patron Struensee were indeed tried as traitors, and executed with revolting cruelty, having first their right hands cut off, and afterwards their heads. But against Matilda they dared not proceed to the extremities they intended. After being confined two months in a fortress, she was sent to the castle of Zell, in Hanover, where she died before her day, the broken-hearted victim of infamous accusations.

After this tragic event Sir Robert was weary of Copenhagen. During nearly a twelvemonth that he had resided there he had never experienced anything like kindness, and this reserve would soon, in all likelihood, have been changed into downright rudeness. For was Danish pride likely to forget how he had braved it at its height? Fortunately he was not subjected to the experiment; for in November, 1772, he was appointed to hold at Vienna the situation of British ambassador, the same office which his father had held nearly twenty years before at the court of Maria Theresa. Vienna appears to have been more to Sir Robert's taste than Copenhagen, but it was only because it was the least of two evils, for, in other respects, the Austrian capital appears to have been a huge compound of frivolity and dulness. The following is his sketch of it:—"The ephemeral fly, which is born in the morning to die at night, might hold up the conversation of one-half of our most brilliant aides. The play, the dance, your horse, my coach, a pretty embroidery, or a well-fancied lining, these are the favourite topics; upon every one of which I am a numskull of the first water. I never play at cards; *ergo*, I am not only a stupid fellow, but a useless one." Cards, indeed, he held in utter detestation, and could not be persuaded to touch them, either in jest or earnest; and yet the Viennese were such a gambling, card-playing people, that a diplomatist could have little chance among them unless he countenanced them in their folly. Sir Robert, in this case, hit upon the following compromise, on the ingenuity of which he valued himself not a little: "A lady who is generally remarkably lucky at cards, but who had lately a bad run of about a week, complained t'other day loudly of her misfor-

tunes, and said she must soon relinquish cards, her favourite amusement. I immediately thought I might strike an advantageous bargain with this dear creature, and satisfy all mankind. I therefore agreed to attack Dame Fortune with my money and her fingers; and now she plays her three parties every day in my name, and at my risk; and I am now one of the prettiest card-players in Vienna—*by proxy!*” All this was dull enough at the best; but one of his official duties was to endure it with a contented countenance, and appear happy with everything around him. His chief consolation consisted in epistolary correspondence with his friends at home, and while he freely imparted to them those lively communications in which his duties of political secrecy were not compromised, he was urgent for a full requital. Amidst these interchanges, also, the thought of his own country, of which he had seen so little, was always uppermost, and he was anxious for its improvement; so that amidst his diplomatic cares he would attend to the welfare of Scottish plantations as zealously as if he had been a retired country gentleman. Upon this head, among many other topics, he thus writes to his only sister, the Margaret Bethune Baliol of Sir Walter Scott: “And now pray, my dear Anne, let me appoint you my substitute with G—— (his bailiff in Tweeddale), to din into his ears ‘*Trees, trees, trees,*’ every time you meet him. I have not a twig of his planting at the hall, and I own I expected a forest. This is no joking matter; I would rather be master of a handsome plantation and *hedgerous*, than a mine of gold; so you know you can and will pursue it. You shall be the ranger of the new forest in Tweeddale, and your husband, when you get one, shall be lord-warden of the marches.” Want of trees at this time did indeed constitute the nakedness and the shame of Scotland; and though exertions had for some time been going on to repair the deficiency, all that had as yet been done was little better than Adam’s fig-leaf. It is pleasing to contrast with this the gay costume of foliage with which our country is clothed in the present day.

After having ably discharged his duties of envoy at Vienna, Sir Robert was a second time appointed to the office. The sky of Europe was already lowering with the coming French revolution, so that the utmost political foresight and circumspection was necessary; and here he showed himself a statesman fitted for the crisis. In his duties he was grievously hampered by the remissness of the home government, that left his despatches unanswered; and in 1788 we find him writing to the Marquis of Caermarthen, then secretary of state, upon the subject, with an honesty somewhat rare in diplomatic correspondence, and with a strict stern disinterestedness which few of our envoys would venture to use towards their official superiors. Fifty-three letters he had already written to the secretary’s office, without receiving an answer to any of them. After an indignant remonstrance at such neglect, he adds: “A complete change of system, in regard to German politics, has become not only expedient, but indispensably necessary. But that it should have taken place in the king’s councils without any secretary of state’s having ever given me the most distant intimation of such a decision, is what I cannot comprehend. I am bold to say (and I should not deserve the honour of serving the king as his minister at the first court of Germany if I refrained from saying it *loudly*), that such concealment is disgraceful to me in the position in which the king has placed me, and likewise prejudicial to his service.” The conclusion to this remonstrance was inevitable:—unless the injury

was “immediately repaired by confidential information and instructions,” he must tender his resignation of an office for which he was thus declared unfit. The integrity and decision of the justly offended statesman were too well known to be trifled with, and his appeal was followed with due acknowledgment.

The political career of Sir Robert Murray Keith was closed with the pacification of Austria, Russia, and Turkey, previous to the excesses of the French revolution—a pacification which his labours tended greatly to accomplish. He died at Hammersmith, near London, in 1795, in the sixty-fifth year of his age.

KEITH-ELPHINSTONE, GEORGE (Viscount Keith, K.B., Admiral of the Red, &c.), a distinguished naval officer, was the fifth son of Charles, tenth Lord Elphinstone, by the Lady Clementina Fleming, only child of John, sixth Earl of Wigton, and niece and heir-of-line to the last Earl Marischal. His lordship was born on the 12th January, 1746, at Elphinstone in East Lothian, the ancient but now dismantled seat of the family of Elphinstone.

Mr. Elphinstone was early taught, by his remoteness from the chance of family inheritance, to trust to his own exertions for the advancement of his fortune; and having from his earliest years shown a predilection for the navy, he was at sixteen ranked as a midshipman in the *Gosport*, commanded by Captain Jervis, afterwards Earl St. Vincent. The peace of 1763 soon put an end to his immediate hopes of naval glory—though not before he had experienced much advantage from the tuition of his eminent commander. He subsequently served in the *Junco*, *Lively*, and *Emerald* frigates, and, entering on board an Indiaman, commanded by his elder brother, the Honourable W. Elphinstone, made a voyage to China, where, however, he suffered considerably from the climate. Notwithstanding this latter circumstance, he did not scruple to make a voyage to the East Indies in 1767, under Commodore Sir John Lindsay, by whom he was promoted to a lieutenancy.

In 1772 he was advanced to the rank of commander in the *Scorpion* of fourteen guns. In the spring of 1775 he was made post-captain on board the *Marlborough*, seventy-four guns, and soon after he obtained, first, the command of the *Pearl*, and then of the *Perseus* frigate. In the *Perseus*, which was remarkable as the first ship in the British navy that was sheathed with copper, he made a conspicuous figure during the early years of the contest with America as an active and intrepid officer on the coast of that country, under Lord Howe and Admiral Arbuthnot. He was likewise often engaged in the services, in this unhappy war, where sea and land forces were united—in particular, at the reduction of Charleston, he conducted himself with such gallantry in the command of a detachment of seamen as to gain frequent and most honourable mention in the official despatches of General Sir Henry Clinton. The experience which he thus acquired was of great service to him long afterwards, when he had a more prominent and distinguished part to perform.

In 1780, having returned to England with despatches from Admiral Arbuthnot, he was on his arrival appointed to the command of the *Warwick* of fifty guns. In the general election which took place this year, he was chosen member of parliament for Dumbartonshire, where his family possessed some influence; and he was one of those who met at the St. Alban’s Tavern to attempt a reconciliation between Fox and Pitt and the Duke of Portland, with

the view of forming what was called "a broad-bottomed administration." This attempt, as is well known, proved unsuccessful. In the following year, as he was cruising down the Channel in his ship the *Warwick*, he encountered the *Rotterdam*, a Dutch ship of war, bearing fifty guns and 300 men. The manner in which he attacked this vessel and compelled her to strike—more especially as the engagement happened immediately after the *Iris*, a ship of equal force, had been baffled in the attempt—gained Captain Elphinstone much public notice. Soon after he went out to the coast of America, where he served during the remainder of that disastrous war. While on this station, he, in company with other three British vessels of war, captured the French frigate *L'Aigle* of forty guns (twenty-four pounders on the main deck), and a crew of 600 men, commanded by Count de la Touche. Unfortunately for the captors, the enemy's captain escaped to shore with the greater part of a large quantity of specie which was on board the frigate. Two small casks and two boxes, however, of this valuable commodity fell into the hands of the victors. Along with the captain, there also escaped several officers of high rank, and amongst them the commander-in-chief of the French army in America. During his service on the American coast Captain Elphinstone had the honour to receive on board his ship as midshipman, Prince William Henry, afterwards King William IV.; a distinction the more flattering, that the choice of the ship and officer was made by his royal highness himself. At the close of the war, when the subject of our memoir returned to Britain, the Prince of Wales appointed him for life to be secretary and chamberlain of the principality of Wales.

In April, 1787, Captain Elphinstone married Jane, daughter of William Mercer, Esq. of Aldie, in the county of Perth, a lady of large property, by whom he had a daughter, afterwards Viscountess Keith, and wife of Count Flahault, aide-de-camp to the Emperor Napoleon. In 1786 Captain Elphinstone was chosen to represent the shire of Stirling. The breaking out of the French war in 1793 opened a new field for his enterprise and activity, and soon after the occurrence of that event he was appointed to the *Robust* of seventy-four guns, and sailed under the command of Lord Hood to the Mediterranean. The object for which the latter had been sent to these seas was to endeavour to effect a co-operation with the royalists in the south of France. In this his lordship so far succeeded, that the sections of Toulon immediately proclaimed Louis XVII., under a promise of protection from the British fleet, and Marseilles was only prevented from taking a similar step by the approach of a republican army. Before taking possession of Toulon, which was part of the arrangement made with the French royalists by Lord Hood, it was deemed proper to secure the forts which commanded the ships in the roads, and for this duty 1500 men were landed under Captain Keith, who, after effecting this service, was directed to assume the command of the whole as governor of Fort Malgue. In a few days afterwards General Carteaux appeared at the head of a detachment of the republican army on the heights near Toulon. Captain Elphinstone, placing himself at the head of a small body of British and Spanish soldiers, instantly marched out to attack him, and after a gallant contest completely routed the enemy, and captured his artillery, ammunition, horses, and two stand of colours.

In the October following Captain Elphinstone, with Lord Mulgrave and Rear-admiral Gravina, at the head of a combined force of British, Spaniards, and Neapolitans, obtained another complete victory

over a detachment of the French army, consisting of nearly 2000 men, at the heights of Pharon. In this engagement the enemy's loss in killed, wounded, and prisoners was about 1500 men, while on the part of the allied force it amounted only to eight killed, seventy-two wounded, two missing, and forty-eight prisoners.

These successes, however, were insufficient to secure the British in possession of Toulon. The whole force of the republicans became directed to their expulsion; and finding the place no longer tenable, it was determined, though not without much reluctance, to abandon it. In pursuance of this resolution, the whole of the combined troops, to the number of 8000 men, together with several thousand royalists, were embarked on board the British ships early in the morning of the 8th December, without the loss of a single man. This important service was superintended by Captains Elphinstone, Hallinel, and Matthews; and it was principally owing to the care, attention, and vigorous exertions of these officers, and more especially of the first, that it was so well and speedily accomplished. Captain Elphinstone's efficient services on this and some of the immediately preceding occasions procured him high encomiums from both Lord Hood and Lieutenant-general Dundas. On his return to England, which was in the year 1794, he was invested with the knighthood of the Bath, having been previously promoted to the rank of rear-admiral of the blue, and in July the same year was made rear-admiral of the white, and in this capacity hoisted his flag on board the *Barfleur* of ninety-eight guns, and in the year following, having shifted his flag to the *Monarch*, he sailed with a small squadron for the Cape of Good Hope, then in the possession of the Dutch.

A war being about to commence between Great Britain and the Batavian republic, the object of Admiral Elphinstone was to reduce the settlements at the Cape—a service which he effectually accomplished, besides capturing a squadron which had been sent out for its defence. On the completion of this important undertaking he returned to England, now advanced to the rank of vice-admiral; and the cabinet was so highly gratified with the great service he had rendered his country by securing to it so valuable a colony as that of the Cape, that they conferred upon him yet further honours.

In 1797 he was created an Irish peer by the title of Baron Keith of Stonehaven-Marischal, and shortly after assumed the command of a detachment of the Channel fleet. In this year also he was presented by the directors of the East India Company with a splendid sword, valued at 500 guineas, as an acknowledgment of his eminent services. In 1798 Lord Keith hoisted his flag on board the *Foudroyant*, and sailed for the Mediterranean as second in command under the Earl St. Vincent, who was already there with a large fleet.

Early in the beginning of the following year he was promoted to the rank of vice-admiral of the red, and on the occasion of a temporary indisposition of Earl St. Vincent, assumed the entire command of the fleet. Here he continued employed in blockading the Spanish fleet till May, 1799, when he went in pursuit of the Brest fleet. His search, however, being unsuccessful, he returned to England. In November he again sailed for the Mediterranean to take the command of the fleet there, and which was now wholly resigned to him in consequence of the increasing illness of the Earl St. Vincent. While in this command Lord Keith performed a series of important services. By the judicious arrangement of his ships and the co-operation of Lord Nelson he

succeeded in capturing two large French ships proceeding to La Valetta with troops and stores. He blockaded the ports of Toulon, Marseilles, Nice, and the coast of the Riviera; and, co-operating with the Austrians who were besieging Genoa, he so effectually cut off all supplies from the French garrison in that place by the activity of his blockade, that they were compelled to surrender. In the following September the island of Malta was captured by a detachment of his fleet. The British cabinet having determined to make a descent on Spain, Lord Keith and Sir Ralph Abercromby entered the bay of Cadiz with a large fleet, having on board about 18,000 troops. Circumstances, however, occurred, which the admiral and general conceived warranted them in not attempting the proposed landing, and they accordingly withdrew without making any descent.

The greatest and most brilliant of all Lord Keith's services, however, was yet to be performed; this was the celebrated landing of Aboukir, one of the most splendid affairs in the annals of war; and it was in a great measure owing to the promptitude and skill of the admiral alone, that this critical and perilous enterprise was so triumphantly accomplished. For this important service Lord Keith received the thanks of both houses of parliament, and on the 5th December, 1801, he was created a baron of the United Kingdom, by the title of Baron Keith of Barheath, county of Dumbarton. He had been previously advanced to the rank of admiral of the blue. In the fulness of the country's gratitude for his services he was also presented by the corporation of London with the freedom of the city in a gold box, together with a sword of the value of 100 guineas, and was invested by the Grand Signor with the order of the Crescent, which he had established to perpetuate the memory of the services rendered to the Ottoman empire by the British.

In 1803 Lord Keith was appointed commander-in-chief of all his majesty's ships in the North Sea. In 1805 he was further advanced to the rank of rear-admiral of the white, and in 1812 succeeded Sir Charles Cotton as commander-in-chief of the Channel fleet. While on this station it was his lot to be the means of capturing the person of Napoleon Bonaparte on his flight from France after the battle of Waterloo. The disposition which Lord Keith made of his ships on this occasion was such, that the distinguished fugitive, after being taken by Captain Maitland of the *Bellerophon*, acknowledged escape to have been impossible. His treatment of his prisoner was as noble, delicate, and humane, as the arrangements for seizing him had been dexterous. He acted throughout the whole affair with so much good sense and right feeling, that he at once gained the esteem and gratitude of Napoleon, and the approbation of the government which he represented.

In 1814 Lord Keith had been created a viscount; and at the conclusion of the war by the exile of Napoleon to St. Helena, he retired to enjoy his well-earned honours in the bosom of his family and the society of his former friends. Latterly he resided constantly on his estate of Tulliallan, where he erected a mansion-house suited to his rank and fortune. There he also expended large sums in works of permanent utility, and united with constant acts of voluntary bounty the encouragement of industrious pursuit and useful occupation, those sure sources of comfort to a surrounding population. The strength of his natural understanding enabled him to derive the utmost benefit from all that he had occasion to see or to contemplate. A most tenacious memory and great readiness enabled him to bring all his informa-

tion effectually into action when the occasion called for it. Such powers, united to a fertility of mind which is rarely excelled, rendered him a most distinguished character in all that regarded his profession. In social intercourse his kindly nature was constantly predominant: he was entirely free of affectation in conversation, and he dealt out the facts and anecdotes with which his memory was stored in a most interesting and amusing manner. Lord Keith was invariably influenced by the kindest feelings for all who were connected with him, and, without solicitation on their part, he was uniformly alive to whatever could promote their interest. But this did not limit the extent of his usefulness to others; on the contrary, being always open to approach, he was zealous in forwarding to the utmost of his power the objects of deserving men. Accordingly, it may be safely said of him that he could reckon as great a number of meritorious officers of all ranks and descriptions, who had been placed in their proper stations by his efforts, as any man of his rank who served during the same distinguished period of our naval history.

His first lady having died in 1789, Lord Keith married, in January, 1808, the eldest daughter of Henry Thrale, Esq., M.P. for Southwark; of which union the issue was one child, a daughter. In 1822 Lord Keith was permitted by the king to accept the last additional honour he was to receive on earth, in the shape of a grand cross of the royal Sardinian order of St. Maurice and St. Lazare. He died at Tulliallan House on the 10th of March, 1823, in the seventy-eighth year of his age.

KELLIE, EARL OF. See **ERSKINE** (THOMAS ALEXANDER).

KEMP, GEORGE MEIKLE.—This architect, whose great work, the Scott Monument, one of the noblest ornaments of Edinburgh, has secured the admiration of Europe and the approbation of the highest judges of architectural excellence in every country, was the son of a lowly shepherd, who pursued his occupation on the southern slope of the Pentland Hills. Such a scenery, where nothing but nature predominated, in the form of bare brown mountains and dashing waterfalls, was the least of all adapted to create a perception of the beautiful in art; so that, had not Kemp been born an architect, he would probably have been to the end of his days a shepherd or a mechanic. But at the age of ten years, having been sent with a message to Roslin, only six miles distant, he then, and for the first time, beheld the creative power of man, in the remains of the ancient castle of Roslin, and above all, in its exquisite gem, the chapel. The delight he experienced at this new revelation, and the earnestness with which he gazed at each portion of the work, not only confirmed his choice of life, but abode with him as vivid remembrances to the end of his days. The present, however, had to be cared for in the meantime; and young Kemp, as soon as he was fit for work, became apprentice to a joiner near Eddlestone; and when his term of service had expired, he went to Galashiels, where he was employed nearly a twelvemonth in the workshop of a millwright. The last-mentioned locality brought him into the neighbourhood of those districts where some of the richest specimens of ancient cathedral architecture which our island contains are all but grouped together, and thus he had many an opportunity of inspecting the remains of the abbeys of Melrose, Dryburgh, Kelso, and Jedburgh. After having fully studied these inspiring lessons, until Kemp, the humble millwright, had become heart and soul an architect, he went to England, where he

worked a short time as a joiner, but omitting no opportunity of pursuing his natural vocation by studying the remains of Gothic architecture. A specimen of his zeal in this way was his walking fifty miles to York, to inspect its cathedral, and afterwards returning on foot. From Lancashire he removed to Glasgow, where he lived some time as a journeyman at his craft, and as a student within the massive shadows of the cathedral. Mr. Kemp came to Edinburgh in 1816 or 1817, and remained in the employment of the same party, as a joiner, until May, 1824, when he went to London. During this period he displayed the same bent of mind, as he was in the constant habit of making excursions into the country, even to remote districts, to examine some object of interest. A Roman camp, a fragment of Norman or early Gothic architecture, a battle-field, or the birthplace of some poet or warrior, all alike interested him. In pursuit of some such object he would often leave his work for days together. He was fortunately an excellent pedestrian, and could walk forty miles a day with ease; for in those days the facilities of railway travelling did not exist. Kemp was an ardent admirer of our older poets. Chaucer, Sir David Lindsay, and Drummond were his favourites; Burns he could almost repeat by heart; and he wrote occasional verses himself. Nor did he entirely neglect his musical powers. He was fond of the violin, and could bring out his favourite Scotch airs on that instrument with taste and feeling. Kemp, therefore, while following his humble calling, was recognized by his immediate friends as a man of genius; and during the whole period of his residence in Edinburgh, he was on terms of closest intimacy with the family of his employer, with whom, on all festive occasions, he was a welcome guest.

Having learned all that Britain could teach him in the science of Gothic architecture, Mr. Kemp resolved to carry his researches into a more ample field. His design was to travel over Europe, inspecting its ancient remains of architecture, wherever they were to be found, and supporting himself, during his stay in the neighbourhood of each, by working at his ordinary trade. It was the spirit of the ancient builders, who roamed in companies from land to land, and whose footsteps a thousand years have not erased—men who were content to merge their individual names into the band of which they were a part, and into the art which they so devotedly and disinterestedly loved; and who cared not, if their works only survived to future ages, whether posterity should retain or throw aside the memory of those by whom such permanent sanctuaries for peace and contemplation were created in the midst of universal strife and havoc. It must have been such men as Kemp who were the leaders and master-spirits of such bands. In 1824 he commenced his tour, which extended from Boulogne to Abbeville, to Beauvais and Paris, halting at each place for some weeks, and studying their architectural remains during every hour of leisure in his handicraft employment. In such a city as Paris his pecuniary difficulties might have been increased but for the demand of English workmen in France for mill machinery; and as Kemp was skilful in this department, he obtained full and profitable employment, so that he could confront the expenses of living in the capital, and study at leisure the details of Notre-Dame, and other less noted structures. After two years' travel of this kind in England and France, Kemp, on returning to Edinburgh, commenced business as a joiner, but was unsuccessful—and could he well be otherwise, when his heart was neither in the wood-yard nor at the planing-board?

His hand, indeed, was more conversant at this time with the pencil than with axe or saw; and he was busy in the study of drawing and perspective, in which he soon became a proficient without the aid of a master. Having been unsuccessful in business as a master-joiner, Kemp returned to his former station as journeyman, to which he added the employment of an architectural draughtsman; and such was now the superior beauty and correctness of his drawings, that they soon found purchasers. One of the commissions of this kind he received was from Mr. Burn, the eminent architect, by whom he was employed to copy some of the working-drawings for the palace proposed to be built at Dalkeith as the future mansion for the princely house of Buccleuch. Instead, however, of proceeding with the drawings, he set about modelling a section of the building in wood, and with such success, and so greatly to the satisfaction of the architect, Mr. Burn, that it resulted in a commission to do the whole edifice in the same style. On receiving this commission he commenced the model with characteristic enthusiasm, and his own modest apartments soon becoming too small for the work, the architect's ample drawing-room was, for the time being, converted into a workshop, and in it this remarkable specimen of zeal, ingenuity, and neat-handedness, was brought to a satisfactory conclusion, after occupying Kemp and an assistant for two whole years. After the miniature palace was finished, it was transferred to the vestibule of the ducal residence at Dalkeith, of which it forms an attractive ornament.

Amongst the engagements into which the occupation of draughtsman brought him, was that of furnishing drawings for a work illustrative of the ecclesiastical antiquities of Scotland, similar to Britton's *Cathedral Antiquities*, projected by Mr. James Johnston, engraver, Edinburgh. For this his intimate knowledge of architectural detail eminently qualified him; and he accordingly, during the years 1832 and 1833, executed a number of drawings of singular correctness and beauty, besides a large series of preparative sketches, embracing Elgin, Pluscardine, Kinloss, Melrose, Roslin, and other of our ecclesiastical remains. During the progress of these drawings Mr. Kemp and the publishers of the present work became acquainted. After Mr. Johnston's premature death, the drawings made for him came into their possession, and Mr. Kemp subsequently completed, at their expense, the measurements and drawings of the Glasgow Cathedral, during the years 1834-35. While he was making these drawings, the project of repairing and completing this beautiful specimen of early pointed architecture was put forth by Mr. M'Lellan, in Glasgow. This led Kemp to prepare a design for the restoration and completion of the building. Fully to exhibit the character of this design, and to demonstrate his ability to construct it if employed to do so, he, in the years 1837, 1838, and 1839, at much sacrifice and labour, prepared a model of the entire cathedral, in which so perfectly did the new portions harmonize with the old, that it would have puzzled any architect not conversant with the building as it really stood, to tell what part was old, and what were Mr. Kemp's additions. Unhappily, the design would have cost more money to execute than there was at that time any expectation of obtaining from government or otherwise; and it remains only an evidence of Mr. Kemp's persevering patience, skill in handicraft, and architectural genius.

Thus matured in taste, talent, and skill, by an apprenticeship that was unique in the history of modern architecture, it was now full time that the

knowledge of Mr. Kemp's abilities should be extended beyond the circle of his admiring friends, into the world at large. Nothing less, indeed, than a great national work was adequate to such a genius; but what chance was there that an aproned, hard-handed mechanic would be intrusted with such a commission, especially when so many learned Vitruvius were in the field? Happily enough, however, the chance did come. The more than national, the universal desire to erect a monument to Sir Walter Scott in the fair metropolis of that country for which he had done so much, and the proposals that were issued for plans of the work, excited an unwonted stir of artistic emulation; it was an opportunity by which the fortunate candidate might link himself to the undying fame of the great poet and novelist. Fifty-four plans sent to the head-quarters of the committee of subscribers in Edinburgh were the fruits of this competition, of which plans there were twenty-two Gothic structures, eleven statues combined with architectural accompaniments, fourteen Grecian temples, five pillars, one obelisk, and one fountain. Amidst such a profusion the committee made no decisive choice; but, in terms of their agreement, they selected the best three for the prize of £50 a piece, and laid themselves open for fresh competition. Of the three designs thus distinguished above the rest, two were by eminent English architects, and the third by some individual who as yet had no name of his own, or was shy of bringing it into notice, for he signed himself John Morvo. Who was this John Morvo? It was no other than Kemp himself, who had thus come timidly forward, and secured a safe retreat in case of failure. In five days he had drawn the plan, during which period he had suspended his work on the model of the Glasgow Cathedral, with which he was at this period occupied, and as soon as it was done he resumed his labour, apparently thinking no farther of a trial in which the chances were so hopelessly against him. In this mood he trudged home from Linlithgow on the evening of the day of decision, and on crossing his threshold was met by his wife with news of the three lucky candidates, which she had learned from an acquaintance, and whose names she repeated. What a happy moment it must have been for both when the real John Morvo was revealed!

As the lists were now opened for a second trial, Kemp, animated by his late success, was ready to resume it with double ardour. His first plan had been a tall Gothic tower or spire, whose original conception and details he had adapted from Melrose Abbey, a structure the lines of which had been for years impressed upon his memory, and of which, also, three drawings that he had executed in 1830 first brought him into notice as an architect in the highest sense of the term. Adopting his earlier design as the groundwork, he now produced such an improvement upon it as secured for it the choice of the whole committee, with the exception of only two dissenting voices—one on the plea that Kemp was unknown, and the other that his plan was a plagiarism. The declaration, however, of the committee, that the "design was an imposing structure of 135 feet in height, of beautiful proportions, in strict conformity with the purity in taste and style of Melrose Abbey, from which it is in its details derived," and the attestation of Mr. Burn, who expressed to the committee "his great admiration of the elegance of Mr. Kemp's design, its purity as a Gothic composition, and more particularly the constructive skill exhibited throughout in the combination of the graceful features of that style of architecture, in such a manner as to satisfy any professional man of the

correctness of its principle, and the perfect solidity which it would possess when built"—these testimonies sufficed, in the first instance, to show that Mr. Kemp's plan was a congenial inspiration, not a plagiarism, and that, if he was still unknown to the world, he ought to be so no longer. But who would now think of adducing such frivolous objections, with the testimony of the whole world against him? The Scott Monument has been visited from every land; engravings of it are diffused over the wide earth; and as long as it stands in its majestic and imposing beauty, the pilgrims of future centuries, who gaze upon it in silent admiration, will connect the name of its builder with the thought of him whom it commemorates.

Mr. Kemp had thus passed, by a single stride, from the condition of a humble mechanic to the highest rank in architectural talent and distinction; and having won such an elevation while life was still in its prime, a long perspective of professional achievements, and the rank and profit by which they would be accompanied, was naturally anticipated for him by his friends, and perhaps by himself also. The building, too, which he had planned, was rapidly rising from base to summit, while at each step the public eye detected some new beauty, and waited impatiently for the completion. But here the life of the artist was brought to a sudden and most disastrous termination. He had been absent from home, employed in matters connected with the structure; and on the evening of the 6th of March, 1844, was returning to his dwelling at Morningside, through Fountainbridge, when, in consequence of the darkness of the night, he had diverged from the direct road, and fallen into the canal-basin at the opening. His body was found in the water several days afterwards, and the whole city, that had now learned to appreciate his excellence, bewailed the mournful event as a public calamity. It was intended to deposit his remains in the vault under the Scott Monument, as their fitting resting-place; but at the last hour this purpose was altered, and the interment took place in St. Cuthbert's Churchyard; while every street through which the funeral passed was crowded with spectators. Such was the end of this promising architect, when his first great work, at that time nearly completed, surpassed the latest and best of those of his contemporaries, and gave promise that architecture would no longer be classed among the *artes ferdite* in Scotland. Mr. Kemp was married, in September, 1832, to Miss Elizabeth Bonnar, sister to the eminent artist Mr. William Bonnar. He left four children, two boys and two girls. His eldest son, a student of architecture, died in December, 1853, at the age of twenty. He was a youth of rare promise and amiable manners, inheriting all his father's genius and enthusiasm for art.

KEMP, KENNETH G. Of this talented scientific experimenter and lecturer, our notice must necessarily be brief, in consequence of his premature departure while his high fame was yet in progress. He was born in 1807; and as soon as he was able to make choice of a particular path in intellectual life, he selected that of chemistry, into which he threw himself with all the ardour of a devotee, or even of a martyr—this last expression being fully needed to express the daring investigations into which he directed his studies, and the equally dangerous experiments by which he arrived at new and important results in chemical science. Not the least of these were his experiments on the theory of combustion and the liquefaction of the gases, with which

he delighted the British Association at their meetings in Edinburgh in 1836. It was not surprising, also, that in such pursuits his inquisitive energetic mind should have made not only discoveries on several chemical compounds, but have recommended the science itself, as yet too generally neglected in Scotland, to the attention of his countrymen—more especially when he had obtained the situation of lecturer on practical chemistry in the university of Edinburgh. Besides his researches into the compounds of substances and the evolution of gases, Mr. Kemp studied deeply the mysteries of electricity and magnetism, and was so fortunate as to be the discoverer of the use of zinc plates in galvanic batteries, by which that invisible power of galvanism can be controlled at pleasure, and directed to the most useful purposes. "Let us never forget to whom we owe this discovery, which, of itself, enables galvanic batteries to be used in the arts. Ages to come will perhaps have to thank the inventor, whom we are too apt to forget—yet still the obligation from the public to Mr. Kemp is the same." This testimony, from an eminent writer, who could well appreciate the subject, will, we trust, have its weight in identifying the discovery with its originator. Another which Mr. Kemp was the first to make—at least the first in Scotland—was the solidifying of carbonic acid gas.

Thus, even at an early period of life, Mr. Kemp had attained to high scientific distinction, and made the abstruse researches of chemistry a subject of popular interest in Scotland, while his example had stimulated those kindred intellects by whom further progress in the science was certain to be secured. Although this was much, still more was anticipated, when his career was cut short by a disease of the heart, under which he had laboured for years, and which perhaps the peculiar nature of his studies among strange substances and deleterious atmospheres had tended silently to aggravate. He died in Edinburgh, on the 30th of December, 1843, at the early age of thirty-six.

KENNEDY, GRACE. This amiable and talented authoress, who shunned fame as earnestly as others seek it, but who nevertheless acquired the highest reputation in her own humble department of literature, was the fourth daughter of Robert Kennedy, Esq. of Pinmore, Ayrshire, and Robina, daughter of John Vans Agnew, Esq. of Barnbaroch, in the county of Wigton. She was born in the family mansion of Pinmore, near Girvan, in 1782, but at an early age was removed with her parents to Edinburgh, where the rest of her life was chiefly spent. Her childhood and youth were periods of silent intellectual progress, in which there was nothing to attract the eye or arrest attention; chiefly consisting of general reading and the acquirement of languages, while of female accomplishments she had an average share. For music indeed she had no predilection, and never studied it, but this defect was compensated by her talent for drawing, in which her ability was attested by the sketches prefixed to her works, which were designed by her own pencil. Amidst the pursuits, however, of a shy and retiring but very active mind, religion was the great object of her solicitude, and this she studied not only as the chief theme of intellectual interest, but of her best affections, and the guide of her whole inner and external life. She was thus unconsciously in training for the department of authorship in which she was to take so conspicuous a part, and her writings were but the transcripts of her habitual thoughts and emotions embodied in interesting narratives.

The entrance of Grace Kennedy into literary life was consistent with her personal character. She felt within herself the consciousness of a power as yet untried, while her desire to promote the best interests of society suggested its direction and use. During the intervals of home occupations, or the demands of social intercourse, her chief recreation had been to convert her place of retirement, whether in town or country, into a study; and there, with a scrap of paper and a pencil, and with a book for a desk, she was wont to write down her thoughts as they arose, and reserve them for future use. All this too was done so quietly and unobtrusively, that even the members of her family were ignorant of these stolen hours of study; and when her first works issued from the press, they were astonished to find that this new anonymous author of whom every one spoke was no other than their own sister. Although her pen had been employed for years, her first publication did not make its appearance until 1821, when she was now thirty-nine years old. It was called *The Decision; or Religion must be All, or is Nothing*; and while works of this nature had hitherto been confined to scenes of humble life, and were exclusively written for the instruction of the poor, Miss Kennedy, in *The Decision*, had selected that higher and more educated class of society to which she herself belonged, and with which she was best acquainted. Her reasons for such a selection she thus stated in a letter to her publisher: "It has often struck me, that amongst the great variety of excellent little works published of late years for the purpose of attracting the attention and regard of young people to the subject of religion, scarcely any have been addressed to the youth of the higher classes. At least I know of very few indeed. It is true, works suited to the poor are equally calculated to teach truth to the rich, when written in the correct and beautiful style that many of them are; but the characters described, and the attendant circumstances, are generally taken from the lower ranks and habits of life, and young people of a higher class too soon learn from those whose opinions they naturally adopt, to consider religion as an excellent thing for the poor, without, at the same time, feeling that they are equally interested in the truths it teaches. I have attempted," she adds, "to make the accompanying little work such as a religious friend might present to a young person of a better class, with a hope that it might bring the necessity of personal religion home to the conscience. I am sensible that I have mingled a good deal that is perhaps trifling in the conversations; but feared, from what I have observed in young people, that they otherwise would have appeared stiff and unnatural."

This publication having proved eminently successful, Miss Kennedy was encouraged to bring out in the following year a work of a similar character, under the title of *Profession is not Principle; or, the Name of Christian is not Christianity*. This was closely followed in the same year by a smaller work devoted to the "short and simple annals of the poor," entitled, "*Jessie Allan, or the Lame Girl, a Story founded on Facts*." This religious sketch or tale contained the history of a young woman whose real name was Nanny Henderson, with whose personal character and history the authoress had become conversant. In December, 1823, appeared the most popular of her works, under the title of *Father Clement*, which, in the form of a well-told and interesting tale, embodies the chief points at issue between Protestantism and Popery, and shows the insufficiency of the latter to satisfy the cravings of a sensitive inquiring mind, dissatisfied with its present

weakness, and anxious about its future safety. *Father Clement* at once became deservedly popular with every class of readers, and the number of editions through which it subsequently passed showed the permanent hold it had established upon the public favour. On the ensuing spring Miss Kennedy published her religious tale called *Anna Ross*, of equal interest but less pretension, being a "story for children." Two tracts from her pen followed soon after, the first being *Andrew Campbell's Visit to his Irish Cousins*, and the second *The Word of God and the Word of Man*, a work addressed to Irish Roman Catholics. At the end of the following year appeared her largest production, *Dunallan: or, Know what you Judge*. Although so late in its appearance it should have been the first of her publications, having been written several years before the rest; but its equivocal form, which somewhat partook of the appearance of a novel, was such an offence in the eyes of the strictly religious, as might have sufficed to extinguish her authorship at the outset. Even as it was, it was condemned by many who had piously abstained from reading it, notwithstanding its admonitory title, *Know what you Judge*. The last work of Miss Kennedy had for its title, *Philip Colville, a Covenanters Story*, and was a vindication of the aspersed children of the covenant, against whom the ancient odium was revived in double heat by Sir Walter Scott's *Old Mortality*. The authoress boldly entered upon her self-imposed task by selecting the murder of Archbishop Sharpe as the principal event, and some of the agents of the deed as the chief heroes of the tale.

Such is the list of the writings of Grace Kennedy during the short space of little more than three years over which her authorship extended, and which, since her death, have been published in six goodly volumes. Independently, however, of the industry which they indicate, their literary merits are of no small amount, so that they deservedly held their place as the most popular writings of their class, although at the time such religious works for the young employed not a few talented writers, and were produced in great abundance. The incidents they relate are happily devised and full of interest; the characters, besides being natural, are admirably delineated; the dialogues in which they express their sentiments are given in natural every-day phrase, instead of stilted declamation; while their religious teaching, instead of being obtruded, arises spontaneously from the actors of the scene, or the incidents described. Such are their excellencies, not usually to be found in that species of literature which may be termed the religious novel, and the works of Grace Kennedy show how well she was qualified to obtain distinction in the more ambitious departments of intellectual competition. But to the young her whole powers and aims were devoted, independently of literary fame, and it would be difficult to estimate the number of youthful minds whom she thus trained for a maturity of excellence and distinction. And still her labours were conducted so unobtrusively, that her name remained unknown till the last year of her life even to her publisher, while his bookshelves were laden with her productions, and his shop with their purchasers, while every tongue was ready with the question, "Who is the author of *Father Clement*?" It was only when laid upon her death-bed, and a short time previous to her departure, that she absolved her family from their promise of secrecy in regard to her works—declaring that the truths which she had endeavoured to urge upon others, she now found sufficient to support her own soul, and that she thought if this were known

it might tend to their being of more use to those who read them. After a severe and tedious illness, she died on the 28th of February, 1825. Her venerable pastor, Dr. Jones, one of the ministers of Edinburgh, who unexpectedly made her death the subject of a funeral sermon, after describing with deep emotion the many noble and amiable qualities by which her life was distinguished, thus spoke of her last moments: "Fifty years and more I have been honoured by being permitted to attend the dying beds of Christians, and many a calm, and many an instructive, and many a peaceful, and many a joyful, and many a dignified, and many a triumphant death have I seen—but never have I seen one more placid, more edifying, or more glorious than that of Grace Kennedy. Full of faith and the Holy Ghost, nothing silly or frivolous could fall from her; all her words were words of wisdom, and all her actions were great and good. On much better grounds than he did, we may say with Addison, 'Come, see how a Christian can die!' Let me die the death of the righteous, and let my last end be like hers!"

KENNEDY, JAMES, Bishop of St. Andrews, was the younger of the two sons of James Kennedy of Dunure, and his wife, the Countess of Angus, daughter of Robert III. King of Scotland. He was born about the year 1405 or 1406. The earlier part of his education he received at home, under the eye of his mother, and was afterwards, agreeably to the practice of the times, sent abroad to complete it. Being early destined to the church, the only road to preferment at that period, and the only profession worthy his dignified descent, he devoted himself to the study particularly of theology and the canon law; but besides his acquirements in these departments of knowledge, he made a singular proficiency in the languages and other branches of learning, and was altogether looked upon as by far the most accomplished prelate of his day.

On his entering into holy orders, he was preferred (1437) by his uncle James I. to the see of Dunkeld. The good bishop was no sooner installed in his office than he set assiduously to work to reform abuses in the church, and to compel his vicars and parsons to a faithful discharge of their duties. He enjoined them to remain in their parishes, and to instruct their parishioners in the knowledge of religion, to preach to them regularly, and to visit, comfort, and encourage the sick. He himself visited all the churches within his diocese four times every year, preaching in each of them as he went along. On these occasions he never failed to inquire of the people if they were duly instructed by their pastors; if they had no complaints against them; whether their poor were properly cared for; and if their youth were brought up in the fear of God. Such were the pious labours of this excellent man at the outset of his career, and he never deviated from them during the whole of a long and active after-life. Finding his own authority insufficient to enable him to accomplish all the good he was desirous of doing, in reforming the abuses which had crept into the church, he went over to Florence to procure additional powers for this purpose from the pope, Eugenius IV. On this occasion his holiness, as a mark of his esteem for the worthy prelate, bestowed upon him the *commendam* of the abbacy of Leone.

On the death of Wardlaw, Bishop of St. Andrews, an event which happened on 6th April, 1440, Kennedy was chosen as his successor in that see; and to this new and more important charge he brought all that activity and anxiety to do good which had distinguished him at Dunkeld. He con-

tinued his efforts to reform the manners and practice of the clergy, and in 1446 set out on a second journey to Italy, to consult with and obtain the co-operation of the pope in his work of reformation. On this occasion he was accompanied by a train of thirty persons; for though moderate in all his enjoyments, he was yet of an exceedingly liberal disposition, and a scrupulous maintainer of the dignity of his sacred office. His dislike of turbulence, his constant efforts to reconcile differences where they existed, and to discountenance oppression, rendered him peculiarly obnoxious to the house of Douglas; and in revenge of the part he took in restraining the power of that ambitious family, his lands were plundered by the Earl of Crawford and Alexander Ogilvie of Inverarrie, at the instigation of the Earl of Douglas, who had farther instructed them to seize if possible the person of the bishop, and to put him in irons. This fate he only avoided by confining himself to his castle. He was, however, eventually the means of reducing the power of the Douglasses within limits more consistent with the peace and safety of the kingdom. James II., almost driven from his throne by the increasing insolence of the chief of that house, went in despair to St. Andrews to seek the counsel of its able bishop. On the prince and prelate meeting, the former informed him that Douglas was mustering a large army either to dethrone him or drive him from the country; that he knew no means of resisting him, and was utterly at a loss what steps to take in this emergency. "Sir," replied the bishop, "I entreat your grace to partake, in the meantime, of some refreshment, and while ye do so I will pass into my chamber and pray to God for you and the commonwealth of this realm." When the king had finished his repast the bishop came forth, and taking him by the hand led him into the apartment in which he himself had been praying, and there they both knelt down and besought the guidance and assistance of Him who directs all things. When they had concluded their devotions, the bishop proceeded to point out to the king such a mode of procedure as he deemed the most suitable to the circumstances. He advised the monarch immediately to issue proclamations calling upon his subjects in the north to muster around his standard, which he afterwards erected at St. Andrews, and offer pardon to all who, having previously attached themselves to the Earl of Douglas, would now abandon his cause and aid that of the king. The consequence was that James soon found himself at the head of 40,000 men. The final muster took place at Stirling, and a battle, which was to decide whether a Douglas or a Stuart was to be King of Scotland, appeared to be at hand; for the former with an equal force was at that moment encamped on the south side of the Carron. But while in the very act of advancing, Douglas detected the effects of the amnesty proclaimed by James by the advice of the bishop. A spirit of disaffection and indications of wavering appeared in his ranks. Alarmed by these symptoms he marched his army back to their encampment, hoping to restore their confidence, but the result was very different, for on the following morning there were not a hundred men remaining of all Douglas' host. Finding himself thus deserted, the earl fled; and in this manner fell the overgrown power of the house of Douglas—a circumstance mainly, if not entirely, attributable to the wisdom and energy of the Bishop of St. Andrews.

On the death of James II. Bishop Kennedy was intrusted with the charge and education of his son, afterwards James III., then about seven years of age. His known wisdom, prudence, and integrity, pointed

him out as the fittest person for this important duty, and on the same ground there was added to it a large share in the management of public affairs during the regency of the queen-mother. He had acquired an authority in the kingdom by the mere influence of his character, which few had ever attained, and he was thus enabled to accomplish more amongst a rude people than would have been effected by mere power or rank. The consequence was, that unusual quietness and prosperity pervaded the whole kingdom during his administration. He enjoyed the confidence of all parties, and was no less esteemed for his probity, humanity, and wisdom, than admired for the splendour of his abilities; and so universal was the satisfaction which his government afforded, that the chief management of public affairs was still left in his hands even after the death of the queen-mother, and remained with him until his own death, which took place on the 10th May, 1466.

Bishop Kennedy was not less remarkable for his munificence than for his other splendid qualities. He founded the college at St. Andrews called St. Salvador's, in honour of our Saviour, and endowed it with a fund for the maintenance of a provost, four regents, and eight poor scholars or bursars, at an expense of about £10,000. He built a ship, which was afterwards known by the name of the *Bishop's Barge*, at a similar cost; and his tomb is said to have been equally expensive with the two former. In 1444 he was appointed chancellor of the kingdom, but this office he resigned a few weeks afterwards, as he found that it interfered with those projects for doing good in his clerical capacity, which he had resolved to follow out from the beginning of his career. He was, by his own desire, interred in the collegiate church of St. Andrews, where his tomb is still shown, along with several silver maces which were found in it some years ago.

KENNEDY, GENERAL SIR JAMES SHAW, K. C. B. This gallant soldier and skilful military tactician was born in 1788. His name was originally James Shaw, that of Kennedy being added at a subsequent period. After being educated at the Royal Military College, he entered the army at Hythe as ensign in the 43d regiment, went through the course of drill and discipline put into practice by Sir John Moore, and was present at the siege of Copenhagen and battle of Kioge in 1807. Under that distinguished commander, also, he accompanied the 43d in 1808 in the advance from Corunna to Sahagun; and during the retreat and afterwards, was attacked by violent fever, followed by long illness, from which he never fully recovered.

In 1809 James Shaw accompanied the 43d to Lisbon, and was present with his regiment at the battle of Talavera. It was on this occasion that the 43d, 52d, and 95th regiments, under General Robert Crawford, reached the British camp, after performing the incredible march of sixty-two English miles in twenty-six hours, in the hottest season of the year, and although each soldier carried from fifty to sixty pounds weight of arms and luggage. At Talavera Shaw became adjutant of his regiment, and at Campo-Mayor he was appointed aide-de-camp to Major-general Robert Crawford. Under this daring and impetuous commander, to whom danger seemed the main charm of a military life, Shaw was present in the numerous affairs that took place on the Agueda and around Ciudad-Rodrigo, and took part in that most interesting charge of cavalry which occurred near to Villa del Puercio. On this occasion a square of French infantry, consisting of about 200 men commanded by Captain Gouache, had formed in such a

peculiar position, that Shaw was commissioned to ride up close to the face of it, and ascertain its exact position before the attack commenced. He accordingly looked at and over the square, but though so close at hand, not a shot was fired at him—the enemy were too intent upon keeping their ranks compact and steady to discompose their order by bringing down one man. To Shaw it seemed a golden opportunity of deciding the long-pending question, whether well-formed and steady infantry can be broken by a charge of cavalry. The square was first attacked by a troop of the King's German Hussars and a troop of the 16th Light Dragoons, and afterwards by a squadron of the 14th Light Dragoons; but, in both cases, the attacks failed, and their assailants were beaten off, with the loss of their colonel and thirty-two troopers, while the French did not lose a man.

When Ney advanced towards Almeida on the Coa, and General Crawford rashly resolved, with little more than 5000 British and Portuguese, to abide the onset of 30,000 French, Shaw received a wound in the left elbow-joint, which, owing to exfoliations of the bone, was long in healing, so that he was secluded for a considerable period from active service. When the Duke of Wellington undertook the siege of Ciudad-Rodrigo, in January, 1812, Shaw, now cured of his wound, was with General Crawford as aide-de-camp, and carried the duke's summons to the governor of the town for its surrender. He also accompanied General Crawford when the light division advanced to the storming of the place. On this occasion Crawford, with that recklessness of danger which had always characterized him, and which seemed to be justified by his numerous escapes, separated himself from the advancing column, to about sixty yards on its left, and planting himself on the very crest of the glacis, issued his orders in the loudest tones. He was thus a mark which the enemy could not miss, except by a miracle, and he fell desperately wounded. Shaw, who alone was with him on this occasion, raised and removed his dying commander from the spot, and received his last instructions. His chief desire in his last moments was, that Shaw should tell his wife "he was quite sure that they would meet in heaven."

The death of Crawford having freed him of his duties as aide-de-camp, Lieutenant Shaw rejoined the 43d regiment, and was present at the siege and assault of Badajos in 1812. The attack was to be made upon the town from different quarters simultaneously, and was so well planned that it was hoped it would prove irresistible; but, from some of these casualties which are so frequent in war, the unity of the effort was prevented, and the enemy put upon their guard. On this account the whole was reduced to a trial of desperate fighting, in which the British had to contend not only with a determined foe, but a fortress doubly and trebly fortified, so that to press on was almost with the certainty to perish. But the assailants, animated with the thirst of revenge and plunder in addition to their native courage, surged on through a tempest of fire and steel that met them at every ditch, gate, and ravelin. They only went onward to fall in heaps, while the enemy taunted their victims as they fell, with, *Why they did not come into Badajos?* "In this dreadful situation," writes the historian of the Peninsular war, "while the dead were lying in heaps, and others continually falling, the wounded crawling about to get some shelter from the merciless shower above, and withal a sickening stench from the burned flesh of the slain, Captain Nicholas of the engineers was observed by Lieutenant Shaw of the 43d, making incredible efforts to

force his way with a few men into the Santa Maria. Collecting fifty soldiers, of all regiments, he joined him, and, passing a deep cut along the foot of the breach, these two young officers, at the head of their band, rushed up the slope of the ruins; but ere they gained two-thirds of the ascent a concentrated fire of musketry and grape dashed nearly the whole dead to the earth. Nicholas was mortally wounded, and the intrepid Shaw stood alone." This was a situation which might have confounded the courage of the bravest, but even at this moment the coolness and considerateness of Shaw remained unshaken; and while thus standing alone, he deliberately pulled out his watch, repeated the hour aloud, and declared that the breach could not be carried that night. This instance of intrepid coolness Captain Nicholas saw, while lying mortally wounded, and afterwards reported before he died. The lieutenant's prediction was correct; the attack on the breach of the Santa Maria bastion was not repeated that night; and, collecting the remains of his followers, and a few chance stragglers from other regiments, Shaw withdrew them to a ruined ravelin which afforded them some shelter from the enemy's fire, and there resolved to continue until the morning, in the correct belief that the occupation of the position was of importance, should the assault on Badajos be repeated on the following day. But they had not long been on the ravelin when the alarm was raised that the French were making a sortie into the ditch, which compelled the handful of British to a hasty retreat.

These, however, were not the whole of Lieutenant Shaw's exploits in the siege of Badajos. Two or three days before the assault was given, an order was issued that the light division was to form for the assault, for which purpose it was stationed after dark, and in the greatest silence, on the left of the Rivellas, with the head of the column near to the quarry, and pointing to the bastion of Trinidad. The head of the column was not to pass the point at which it would be exposed to the enemy's shot; but to ascertain this point would be extremely difficult in the darkness, and impossible by daylight. It was honourable to Lieutenant Shaw that he was chosen to solve the difficulty; and to make it as safe as possible, Colonel M'Leod and another officer posted themselves on the height of St. Michael, to signalize him of any movements of the French from Badajos, or the fort of Pardaleras. The cool, courageous, and scientific manner in which this dangerous midnight exploration was effected, will be best told in Shaw's own language from his autobiography:—"Commencing at a well-ascertained point on the left of the Rivellas—which point could not be mistaken even in the night—I took regular paces—counting my paces—and proceeded directly towards the bastion of Trinidad, until I got very near to the covered way of that bastion, and saw that no further advance could be made by a column without exposure to the fire both of the bastion and of the Pardaleras. M'Leod now made the signal, indicating that the French had sent out a party from the Pardaleras to intercept my return. By returning at the same measured and slow pace at which I had advanced I accomplished two things, viz. measuring again the distance, and imposing on the French detachment; for they evidently were intimidated, from supposing that I was supported. This successful measurement of the required distance for the column to stand upon in safety was of much importance on the night of the assault. By it the column of the light division was placed in the position from which it proceeded to the assault."

After the capture of Badajos Lieutenant Shaw

continued with the 43d during the advance to Salamanca in 1812, the taking of the forts there, the operations on to the Douro, and the retreat to Salamanca. He also did his duty in the memorable battle of Salamanca, where the Duke of Wellington, to use a French officer's expression, "defeated 40,000 men in forty minutes." He then accompanied the army in its advance to Madrid, the reduction of the Retiro, and until after the retreat from Madrid had commenced. During this retreat he became aide-de-camp to General Baron Alten, commanding the light division, and was with him in that capacity in the retreat to Salamanca, and afterwards to Rodrigo, and in the affairs that took place in the retreat. After the retreat of the army to Portugal at the close of 1812, the state of Shaw's health required a return to England on sick-leave, and his return was succeeded by a long and severe fever, the effects of which, and some partial relapses, made his health ever after delicate and precarious, and unfit for severe field-service. But his genius for the higher military operations on which success in war so greatly depends, only shone out the more brightly, and won for him that rank and distinction not always accorded to mere soldierly courage and activity.

Having only partially recovered from these repeated attacks of fever, Shaw rejoined the army, and in 1815, on Napoleon's return from Elba to France, was attached in Belgium to the third division of the Anglo-allied army, which was commanded by General Baron Alten. In this division Shaw held the office of deputy assistant quartermaster-general. Scarcely, however, had the army been a quarter of an hour on the field of Quatre Bras, when the assistant quartermaster-general was wounded, in consequence of which Shaw succeeded to the whole charge of his department for the third division during the momentous days of the 16th, 17th, and 18th of June. This division having been severely engaged on the 16th, had on the following day to be withdrawn under circumstances of peculiar danger, in consequence of the advance of the army under Napoleon from the field of Ligny; and preparatory to this critical process, Shaw was ordered to reconnoitre the country from near Piermont, where the division was stationed, to the Dyle, and fix upon its line of retreat, and the point at which it should pass the Dyle, so as to leave the passage at Genappe free for the other portions of the army. This trying duty of the quartermaster-general was ably performed, as was shown by the operations of which it formed the guide. The third division retired upon the line which Shaw had mapped out for it, in the face of Napoleon's army, with which they actually came into contact, although not more than 6000 strong—crossed a considerable river—and at length reached in safety the great road leading from Genappe to Waterloo. This successful retreat is thus described by the quartermaster himself in his autobiography:—"Every possible precaution was taken to withdraw a great portion of the division before the enemy perceived that it was moving in retreat, and the three brigades were so arranged that they kept in echelons on the line of retreat, each brigade forming on ground favourable for repelling an attack, and so that each brigade should retire in succession; thus the enemy constantly found, as he advanced, brigade after brigade regularly formed for action. Although the enemy closely followed the division, he never attempted any regular attack upon it."

When the great conflict of Waterloo followed, the subject of our memoir performed an important part in that eventful drama. On the 18th of June, when the formation of the French army indicated the de-

sign of an attack on the British position, the Prince of Orange and General Baron Alten were anxious to know how the third division should be formed in order of battle, and referred the question to the Duke of Wellington, who joined them during the discussion. "Form in the usual way," replied the duke, and rode on. This answer did not satisfy the anxious officers, who knew that the division would be particularly exposed to the fire of the enemy's artillery, and the attacks of their numerous and efficient cavalry; and after Wellington had passed onward, the discussion was renewed, but without any result. At length Shaw interposed, and begged that he might be allowed to form the division, to which Baron Alten assented. Aware of the terrible charges of cavalry to which the division would be exposed, and that its formation ought to be such as to give it facilities of rapid formation for resisting cavalry, and equal facilities for the reformation of the line, the quartermaster-general formed the front line into five oblongs, and the second line into four, placed as nearly as possible in exchequer, so that the oblongs of the second line should close up the openings of the first. The propriety of this arrangement was admirably manifested in the engagement: as soon as the French cavalry advanced to charge, the third division readily threw itself into the prescribed oblongs, and the terrible onset, that, in ordinary circumstances, would have sufficed to trample down resistance, or sweep their opponents off the field, was met, broken, and driven back with fatal recoil. In the action Shaw himself had one horse killed and another wounded, and for a short time was disabled by a shot, which, first breaking to pieces the strong steel handle of his sword, struck him on the side. Baron Alten also was wounded, and compelled to quit the field. But these were such trivial disasters compared with the great victory, that the wounded heroes felt no room for regret. Nor was General Alten unmindful of the merits of his quartermaster-general; and in his report on the following day to the Duke of Wellington, he acknowledged them in these words:—"The services of Captain Shaw, deputy assistant quartermaster-general, who was senior of the department in the absence of Major Jessop, from a wound, were indispensable to me for executing the disposition of the troops for the attack." On the following day, also, he thus expressed himself upon the same subject in a letter to the duke: "Captain Shaw, deputy assistant quartermaster-general, whose services previous to and during the action were most important to me, is an officer who should be brought forward and placed in situations where his military talents can be best employed." This, however, was not all. After the victory of Waterloo, and the triumphant entrance of the allies into Paris, Baron Alten thus recommended Shaw, who had been promoted to a majority, to General Sir George Murray, who was appointed chief of the staff to the allied army of occupation:—

"As I perceive by the general orders of the 3d inst., that Major Shaw of the 43d regiment, assistant quartermaster-general to the third division, will be discontinued on the staff from the 25th inst., I beg leave to inform you that his grace the Duke of Wellington was good enough to appoint that officer on the staff in May last, and to the third division, then under my command, in consequence of my recommendation, which I grounded on a long acquaintance I had with Major Shaw in the Peninsula, where he served on my staff, and gave me an opportunity to know his value as a staff-officer. Since his late appointment in this country, and particularly during the actions of the 16th and 18th of June last, where he was in

charge of the department with the division, he has again so much confirmed the high opinion I always entertained of his gallantry, zeal, and abilities, that I feel it due to him to bring it to your knowledge, and to say that, should you at any period have an opening in the quartermaster-general's department, and are disposed to fix your choice on him, I can with every confidence recommend him as an acquisition."

On the formation of the allied army of occupation in France, the condition that Calais should be open for this portion of the British troops in its communications with England was inadvertently omitted. The Duke of Wellington obtained the consent of the French government that this error should be rectified, and that Major Shaw on the part of his grace should settle at Calais, with a colonel on the part of France, as to how this town should be partially occupied by a British detachment until the army of occupation was withdrawn. The negotiation to that effect was conducted by Shaw so ably and effectively, that the Duke of Wellington expressed his approbation, and declared that but for this settlement, he should have been obliged to change the establishment from Calais to Ostend. The arrangements for the embarkation of the army of observation fell upon the major and Captain Hill of the navy. Five thousand Russian troops were previously to be embarked, and for his services on this occasion Major Shaw received the thanks of the Emperor Alexander, and the present of a diamond ring, through Count Woronzow. After the army of occupation had been broken up in France, he was also promoted to the brevet rank of lieutenant-colonel upon the recommendation of the Duke of Wellington.

The active services of Colonel Shaw in the field being now terminated by the establishment of a lasting peace, he returned to his native country, and in 1820 espoused Mary, daughter of David Kennedy, Esq., in consequence of which marriage he added the latter name to his own. In 1826 he was appointed assistant adjutant-general of the northern district of Ireland, and near the close of 1826 he was removed to Manchester in the same capacity, where he remained till 1836. That long period was one of considerable excitement among the workpeople of the potteries and manufactories of Lancashire, and to suppress these fell entirely upon Colonel Shaw Kennedy, as the general officers who commanded the northern districts had their head-quarters in Yorkshire, and seldom entered Lancashire. In describing his situation under such trying circumstances, the colonel says, "I leave others to judge what degree of difficulty and delicacy there is in the management of so wide a district, with so great a population, when it is much disturbed. The prompt supply of troops as they may be properly wanted; their proper distribution; the preparation of temporary barracks; the arrangements to be arrived at with the magistrates in their respective districts; and, above all, the personal command of the troops when opposing riots, are presumed here to present no trifling difficulties, if they are so managed as to prevent loss of property, and maintain the supremacy of the law and the complete authority of the magistrates, and yet so as to avoid the necessity of absolute collision and bloodshed." Coming to the conclusion, he adds, "These objects, I presume to state, were thoroughly accomplished during the whole period of my being on the staff in the northern district, not only for Manchester, but for the whole of the surrounding district;—for the whole of Lancashire and the district of the potteries." How well they were performed was indicated by the official thanks of the military

authorities, and those at the home-office, at his departure; and by a handsome address and a testimonial of a service of plate from the town of Manchester.

After holding office for about nine years at Manchester as assistant adjutant-general, Colonel Shaw Kennedy was offered the appointment of first commissioner of the metropolitan police force, then about to be formed by Sir Robert Peel, secretary of state for the home department; but, being unwilling to leave his own profession, he declined the offer. But his talents being now recognized in the suppression of civil commotions, he was desired by government to take the situation of inspector-general of the Irish constabulary force when it was consolidated into a civil army of 8000 men, and as this situation was more of a military character than the other, he undertook the office. Among the other regulations by which this large force was organized for its peculiar duties, Colonel Kennedy wrote out for its express use a system of drill and field exercise, which was so effectually carried out, that the Irish police was fit to form the advance or rear guard of an army, or to have formed in a solid order of battle. Having brought the body into this efficient state, he resigned his command, after he had held it for two years.

During the great Chartist demonstration in London in 1848, government, being anxious about the state of Liverpool, resolved to send there a body of troops under the command of a general officer, and Kennedy, having two years previously been promoted to the rank of major-general, was appointed to command it. In the same year a still more formidable insurrectionary movement having taken place in Ireland, he was appointed, in company with Viscount Hardinge, to assist in its suppression. But at the time he was in Scotland, and so ill in health that he was unable to sit on horseback even for an hour, so that he was obliged reluctantly to forego so honourable an appointment. The same cause obliged him in 1852 to resign the command of the forces in Scotland, after he had accepted the office, and been in readiness to proceed to Edinburgh.

Thus full of years and of honour, and distinguished by talents alike fitted for foreign wars and intestine commotions, Major-general Sir James Shaw Kennedy died at Bath, on the 30th of May, 1865, at the ripe age of seventy-seven. His character is thus summed up in the *Guardian*, by the Rev. W. C. Luke, who enjoyed his intimacy and appreciated his worth:—

"If it had not been for a delicacy of health, like that which Napier describes in Colonel M'Leod, 'whose feeble body would have been quite unfit for war if it had not been sustained by an unconquerable spirit,' General Shaw Kennedy would unquestionably have been one of the greatest commanders of the time. This, I believe, was Sir William Napier's opinion. He was, in addition to this, a man of extensive reading and remarkable powers of conversation; and there must be some of your readers who were brought in contact with him in later life, when at seventy-five he retained the freshness and animation of a boy, who must have been impressed like myself with the feeling that they scarcely ever met with a man of greater natural power and energy. . . . In many qualities there is often said to be a resemblance between the profession of a clergyman and that of a soldier, and I think that few clergymen could have been brought into the presence of so much resolution, energy, and modesty, without feeling themselves the better for it, and believing that their own profession would not be injured by the study of such examples."

Although the general was so well qualified to

illustrate the important subject of military science, his only literary production in this department was a single volume, entitled *Notes on the Battle of Waterloo*, published in London in 1865. It consists of critical and explanatory notes of that great conflict, with a map of the battle-field, and sketches of the positions of the different battalions—a brief autobiography of his own services, from which the foregoing account has been taken—and a plan for the defence of Canada, a subject of daily growing importance.

KER, JOHN, third Duke of Roxburgh, distinguished by his eminent bibliographical knowledge, and his extensive and valuable collection of books, was born in Hanover Square, London, on the 23d April, 1740. He was the eldest son of Robert, the second duke, by Essex Mostyn, daughter of Sir Roger Mostyn, of Mostyn, in Kentshire, Baronet. In 1755 he succeeded his father in the dukedom, to which was attached the British peerage of Earl and Baron Ker of Wakefield; and he appears to have soon after proceeded upon his travels on the Continent. It is stated that while in Germany he formed an attachment to Christiana Sophia Albertina, eldest daughter of the Duke of Mecklenburg Strelitz, and that their nuptials would have taken place, had not her sister Charlotte just at that time been espoused by the King of Great Britain. Etiquette then interfered to prevent what would otherwise have been an equal and proper match, it being deemed improper that the elder should become the subject of the younger sister. Both parties, however, evinced the strength of their attachment, by devoting their after-lives to celibacy. It seems to have been to this event that Sir Walter Scott alludes, when he says of the duke:¹ "Youthful misfortunes, of a kind against which neither wealth nor rank possess a talisman, cast an early shade of gloom over his prospects, and gave to one splendidly endowed with the means of enjoying society, that degree of reserved melancholy, which prefers retirement to the splendid scenes of gayety." To whatever extent George III. might be the innocent cause of his grace's misfortune, it does not appear to have in the least marred a strong friendship which existed between them—"a tie of rare occurrence," Sir Walter Scott justly observes, "between prince and subject." In 1767 his grace was appointed a lord of the bed-chamber, and next year was invested with the order of the Thistle. The former honour gave him a title to be much about the court; but he never farther engaged himself in a public career.

The taste which his grace imbibed to so extraordinary an extent for book-collecting, is stated by Sir Walter to have originated in an accidental circumstance. "Lord Oxford and Lord Sunderland, both famous collectors of the time, dined one day at the house of the second Duke of Roxburgh, when their conversation happened to turn upon the *editio princeps* of Boccaccio, printed at Venice in 1471, and so rare that its very existence was doubted of. The duke was himself no collector, but it happened that a copy of this very book had passed under his eye, and been offered to him for sale at a hundred guineas, then thought an immense price. It was therefore with complete assurance that he undertook to produce to the connoisseurs a copy of the treasure in question, and did so at the time appointed, with no small triumph. His son, then Marquis of Beaumont, never forgot the little scene upon this occasion, and used to ascribe to it the strong passion which he

ever afterwards felt for rare books and editions, and which rendered him one of the most assiduous and judicious collectors that ever formed a sumptuous library." But a still stronger instance of the power of bibliomania was afforded at the sale of the duke's library, and in the case of this very book. When it was put up, the first offer was 100 guineas, the original sum which his grace had paid for it—but at the sight of it a tempest of enthusiasm pervaded the meeting, the biddings rose, and after a long and almost frantic competition, it was at length knocked down to the Marquis of Blandford for £2260. Such a sum for a copy of the works of Boccaccio! Well might it be said by one who describes the scene, that the sound of the fall of the auctioneer's hammer was "heard in the libraries of Rome, of Milan, and St. Mark." The purchaser had previously a copy of the same edition, but it wanted five leaves, and he was resolved to secure the present one, though he should go as far as £5000 for it.

There can be no doubt, at the same time, that the duke chanced to possess that perseverance of character and genuine literary taste, without which such an impulse as this must have been of no avail. "Sylvan amusements," says Sir Walter, "occupied the more active part of his time when in Scotland; and in book-collecting, while residing in London, he displayed a degree of patience which has rarely been equalled, and never excelled. It could scarcely be said whether the Duke of Roxburgh's assiduity and eagerness were most remarkable, when he lay for hours together, though the snow was falling at the time, beside some lovely spring in the Cheviot Hills, where he expected the precarious chance of shooting a wild goose, when the dawning should break; or when he toiled for hours, nay, for days, collating and verifying his edition of the *Black Acts* or Caxton's *Boke of Troy*."

With the exception of singularly fortunate adventures in the procuring of old books, the duke's life passed on in an almost unvaried tenor, in the pursuits just alluded to. At his seat of Fleurs in Scotland, where he spent but a small portion of his time, he had a proportionately small library; but at his house in St. James' Square, London, where he chiefly resided, he, in time, amassed the most valuable private library in the country. In 1796 he was appointed groom of the stable, and initiated a privy-councillor, and in 1801 was honoured with the Garter, which he was permitted to bear along with the Thistle, a mark of honour conferred on no other subject since 1712, when the Duke of Hamilton had the same distinction from Queen Anne.² For upwards of forty years he continued his book-collecting habits without intermission, being much aided during a great part of the time by Mr. G. Nichol, bookseller to the king, whose services towards the excellent library collected by George III., and afterwards given by George IV. to the nation, were also very eminent. At length, on the 19th of March, 1804, the duke died of inflammation in the liver, at his house in London, in the sixty-fourth year of his age. He was buried at Bowden, near Melrose.

His library, at his death, consisted of upwards of 10,000 distinct articles, many of them of the greatest rarity and of high value, though it was understood that in many cases he had purchased them at comparatively low prices. It would be vain to pretend that his grace had made, or could make, a good use

¹ *Quarterly Review*, xlv. 446.

² No man could have borne these honours with more grace than the Duke of Roxburgh, whose "lofty presence and felicitous address," according to Sir Walter Scott, "recalled the ideas of a court in which Lord Chesterfield might have acted as master of the ceremonies."

of such a vast mass of literature, much of it of an obsolete kind; yet, neither can there be any doubt that he read much of what he purchased, and seemed, upon the whole, to aim rather at gratifying an innate taste for letters, and a devout and worshipful regard for their brightest ornaments, than either for the pride of possessing so many curiosities, or the usual antiquarian appreciation of minute peculiarities in the *externe* of books.

Early English literature and the *Table Ronde* had been the chief objects of his research. Of the former he possessed not only the rarest, but, in point of condition, the most beautiful specimens in existence. He idolized the talents of Shakspeare and Cervantes, and collected everything that could illustrate their works. Fifteen different editions of Shakspeare's complete works, with seventy-five separate plays in different editions, and fourteen distinct works respecting this great dramatic author, are to be found in the catalogue. In the poetical department of early English literature he had a great collection; in which the most curious article was a very large assortment of ancient ballads and fugitive pieces of poetry, in three volumes folio, which had been first formed for the library of the Earl of Oxford, afterwards enlarged by Major Pearson and Mr. Isaac Reid, then increased to a great extent by the duke himself, and which brought at the sale no less than £477, 15s. The duke had also collected many ancient manuscripts, some of them splendidly illuminated; and it is mentioned, that he read these with great facility, as was testified by various remarks which he wrote upon them with his own hand. He had the largest and finest collection of the books printed by Caxton, in England. At his death he was in full pursuit of the English dramatic authors; and when the large collection he possessed is taken into account, along with the comparative briefness of the time during which he had directed his attention this way, his industry seems prodigious. He had an uncommon quantity of books and tracts relative to criminals, detections of witches, and other impostors. Mr. Nicol, in the preface to the catalogue, says, "He had a particular pleasure in exercising those discriminating powers which he so eminently possessed in tracing out the images by which the perverted ingenuity of the human mind often attempts to impose upon the credulity of its fellow-creatures." This splendid library was, after a long and distressing delay from litigation, brought to sale, in May, 1812; an event which may be said to have created more sensation than any other connected with literature during the present century—the disclosure of the Waverley secret alone excepted.

KERR, ROBERT, a miscellaneous writer, was born in the year 1755.¹ He was the son of Mr. James Kerr of Bughtridge, jeweller in Edinburgh, convener of the trades and M.P. for the city, which honours he held at the same time,² by Elizabeth, daughter of

Lord Charles Kerr, second son of Robert, first Marquis of Lothian. Mr. Kerr was educated at the high-school and university of Edinburgh; and having qualified himself to act as a surgeon, entered into business as partner with an aged practitioner named Wardrope, whose daughter he subsequently married. He had the misfortune to be very lame in one of his limbs, which caused him to sink greatly to one side in walking. His first literary effort was a translation of Lavoisier's *Elements of Chemistry*, published in 1789, in which year he also gave to the world a version of Berthollet's *Essay on the New Method of Bleaching by Means of Muratic Acid and Oxygen*. The approbation with which these publications were received induced him to commence a translation of Linnaeus' *Zoological System*; two volumes of which were published (4to) in 1792, but which did not meet with so much success as to tempt him to proceed with the rest. Having failed with the dry classifications of the Swedish philosopher, he commenced a translation of the more popular work of Buffon on *Oviparous Quadrupeds and Serpents*, the first volume of which appeared in 1793, and the fourth and last in 1800. The execution of these translations was highly extolled in the reviews of the time, and caused Mr. Kerr to be respectfully known in the world of letters.

The political predilections of this gentleman being decidedly Whiggish, he published in 1794 a pamphlet, entitled *A Vindication of the Friends of Freedom from the Aspersions of Disloyalty*; being designed, as its name imports, to prove that the liberality of his party was not inconsistent with a steady attachment to the existing monarchical form of government. The prevailing tone of his mind was political, and he used to argue on topics which interested him with great ardour and even enthusiasm, insomuch that he often appeared suffering from passion when he was not.

In the year 1794 Mr. Kerr was induced to embark his fortune, which was not inconsiderable, in the purchase and management of a paper-mill at Aytoun in Berwickshire. The speculation, after a trial of several years, turned out unfortunately, and reduced him in the latter part of life to circumstances very inconsistent with his merits, either as a man or as an author. These circumstances, however, renewed his exertions in literature, after they had been long intermitted. In 1809 he published a *General View of the Agriculture of Berwickshire*, and in 1811 *Memoirs of Mr. William Smellie*, and a *History of Scotland during the Reign of Robert Bruce*, both of which last were in two volumes octavo. About the same time he conducted through the press, for Mr. Blackwood, a *General Collection of Voyages and Travels*, in eighteen volumes octavo. *The Memoirs of Mr. Smellie*, though disproportioned to the subject, contain much valuable literary anecdote. Mr. Kerr's last work was a translation of Cuvier's *Essay on the Theory of the Earth*; which was published in 1815 (after his death), with an introduction and notes by Professor Jameson. The event just alluded to took place on the 11th of October, 1813, when he was about fifty-eight years of age. He left one son, a captain in the navy, and two daughters, both of whom were married.

¹ The exact place of his birth is not known: but it was a mansion in Roxburghshire, near the Cheviot Hills, where his mother happened to be on a visit at the time. The usual residence of his parents was in Edinburgh.

² An intimate friend of Mr. Robert Kerr supplies us with the following information respecting his father:—

"Mr. James Kerr was the son of a jeweller in the Parliament Square, Edinburgh, whose shop was attached to the walls of the old cathedral of St. Giles: the first on the right hand in going into the square. The house occupied by this person was a mere cellar under the shop, and partly projecting below the adjacent pavement, from which its sole light was derived by means of a grating. In consequence of the family, which was very numerous, being brought up in this miserable and unhealthy hovel, they all died in infancy, except the father of the author, whose life was saved by his being removed to more roomy accommodations on the opposite side of the square.

Mr. James Kerr was the last citizen who had the honour to represent the city in parliament. It may be mentioned that he was one of the jury on the famous trial of Carnegie of Finhaven, for the murder of the Earl of Strathmore in 1728, when, through the persuasive eloquence of the first Lord-president Dundas, then at the bar, and counsel for the prisoner, the jury recognized the liberty of Scotland, by resuming the right to judge not only of the naked fact, but of the fact and the law conjunctively."

Mr. Kerr was a kind and warm-hearted man, liberal and honourable in his dealings, possessed of extensive information, and in every respect an ornament to society.

KIRKALDY, WILLIAM, one of the earliest converts to the Protestant faith in Scotland, and a brave and accomplished man, was the eldest son of Sir James Kirkaldy of Grange, high-treasurer to James V. of Scotland.¹ Of the period of his birth and the method of his education we have been unable to discover any satisfactory information; but like the greater number of the Scottish barons at that time, he seems to have chosen, or to have been devoted by his parents, to the profession of arms. At the death of James his father seems to have lost his situation in the government; yet with a view of procuring that nobleman's assistance to the cause of Protestantism, he was one of the most active assistants in raising Arran to the regency; but in the hope he had formed he was to a considerable extent disappointed.

Young Grange, as well as his father, had embraced the principles of the Reformation; and his first appearance in the historic page is as one of the conspirators against the persecutor Cardinal David Beaton. The circumstances of this renowned conspiracy have already been commemorated in these pages. The conspirators having, by an act which cannot be justified, avenged the death of the martyr Wishart by assassinating his murderer, shut themselves up in the castle of St. Andrews, which they held for several months, and only surrendered after being besieged by a French force, in the end of July or the beginning of August, 1546. It was stipulated that the lives of all that were in the castle should be spared; that they should be transported to France, whence, if they did not choose to continue in that country, they were to be transported to whatever other country they chose, Scotland excepted. The victors, however, did not find it necessary or convenient to attend to the terms of the stipulation; the greater part of the garrison were sent to the galleys, and the leaders immured in different dungeons. Norman Leslie, Peter Carmichael, and the subject of this memoir, were imprisoned in Mount St. Michael, where they lay a considerable time. From this place they wrote a letter to John Knox, who was in the galleys, asking the somewhat superfluous question whether they might not with a good conscience break their prison. To this Knox naturally answered in the affirmative, with the proviso that they were not morally entitled to shed blood in the attempt.

Embracing the opportunity of a festival night, when the garrison were intoxicated, they bound every man in the castle, locked the doors, and departed, having, it is said, strictly adhered to the humane recommendation of Knox. The two Leslies came to Rohan and speedily escaped; but Kirkaldy and Peter Carmichael, disguised as beggars, wandered through the country for upwards of a quarter of a year; at the termination of which period they got on board a French ship, which landed them in the west of Scotland, whence they found their way into England.

Kirkaldy appears to have spent a considerable portion of the ensuing period of his life in France, where he entered the army, and was distinguished

as a brave and skilful soldier in the wars between the French king and the Emperor Charles V. Sir James Melville informs us that in these wars he commanded a hundred light horsemen; and for his useful services received the commendation of the Duke of Vendome, the Prince of Condé, and the Duke of Aumale. Henry II., he adds, used to point him out and say, "Vonder is one of the most valiant men of our age." Henry indeed seems to have used him with the most endearing familiarity, and in all the pastimes which he attended, is said to have chosen Grange as a supporter of his own side in their mimic battles; while, according to the same writer, who is always circumstantial in recording the honours paid to a Scotsman, the great constable of France would never speak to him uncovered. We are not aware of the exact date of his return to Scotland, but we find him in that country in the year 1559.

During the border wars of this period an incident occurred peculiarly characteristic of the chivalrous temper of Kirkaldy, which is otherwise remarkable as being the latest "passage of arms" which has been handed down to us, described with all the minute "pomp and circumstance" of Froissart. Lindsay of Pitscottie, who describes the circumstance, tells us, that Lord Evers' brother desired to fight with Kirkaldy "ane singular combat upone horseback with speares." Sir William was "very weil content" with such a species of amusement, and consented to meet the challenger on any spot he might prefer. The Lord Evers' brother was attended by the governor of Berwick and his whole garrison, while Kirkaldy was waited on by "Monseor Doswell (Mons. D'Oswell?), the King of France lieftenant," with the garrison of Heymouth, and other Scottish gentlemen. In bringing the opposing armies so near each other, and within view of example so seducing, it was necessary to "deceme under paine of treason, that no man should come near the championes, be the space of ane flight shot." Each of the champions had a squire to bear his spear, there were two trumpeters to sound the charge, and after the most approved method, two lords were appointed as judges of the field, "to sie the matter finished." "And when all things war put to ordour, and the championes horsed, and their speirs in their hands, then the trumpeters sounded, and the heralds cryed, and the judges let them go, and they ran together very furiously on both sides, bot the laird of Grange ran his adversar, the Inglis-man, throw his shoulder blaid, and aff his hors, and was woundit deadlie, and in perill of his lyff; but quihidder he died or lived I cannot tell, but the laird of Grange wan the victorie that day."²

Kirkaldy became after this incident actively engaged in the cause of the Reformation. When the French troops arrived to subdue Scotland, and by means of the Popish faction reduce it to a province of France, no man stood firmer to the interests of his country, and in the first encounter he is said to have slain the first man with his own hand. To the French, who were aware of his bravery and military skill, he was particularly obnoxious, and in one of their inroads through Fife they razed his house of Grange to the foundation. Naturally exasperated at such an act, Kirkaldy sent a defiance to the French commander; reproached him for his barbarity, and reminded him of the many Frenchmen whom he had saved when engaged in quarrels not his own. The commander, less chivalrous than Grange, paid no regard to the communication; and the latter took vengeance by waylaying a party of marauders, and

¹ The facts in this article are in general taken from the memoir of Kirkaldy of Grange by Mr. Graham Dalyell, a gentleman who has been so minute in his investigations that it would be difficult to find a fact of importance omitted by him.

² *Lindsay of Pitscottie*, ii. 524.

cutting them off to a man. During this invasion of Fife by the French he had a mere handful of men, and these were but poorly provided, yet he retarded the powerful and well-appointed troops of France at every village and at every field, disputing as it were every inch of ground, and making them purchase at a ruinous price every advantage.

In common with all the wise and good among his countrymen, Kirkaldy was convinced of the danger of the French alliance, and of the far superior advantages which might be derived from a connection with England, which by a barbarous and ignorant policy had been always overlooked or despised, and he contributed materially to the formation of that friendship which subsisted between the ministers of Elizabeth and the Scottish reformers, without which it may be doubted if the Reformation of that country could have been effected. In the contests that arose between Mary and her subjects, while it must be admitted that his correspondence with the English was clandestine, contrary to the law, and not perhaps dictated by motives quite purely patriotic, he steadily adhered to the popular cause. Kirkaldy was among the number of the adherents of Moray who, on the temporary success of the queen, were compelled in 1565 to take refuge or "banish themselves" in England, and the criminal record shows us some instances of barbarous punishment denounced on those who had intercourse with them, as "intercommuning with rebels."¹

When, after her unhappy marriage and flight to Dunbar, she returned with an army to meet the lords who had entered into a confederation for the preservation of the prince, Grange was one of the most active and influential among them, having the command of 200 horse, with which he intended at Carberry Hill, by a stratagem, to have seized upon the Earl of Bothwell, which he hoped would have been the means of putting an end to the contest between the queen and her subjects. The queen, however, who highly respected him, perceiving the approach of the troop, and understanding that he was their leader, requested to speak with him, which prevented the attempt being made. While he was in this conference with the queen, Bothwell called forth a soldier to shoot him, who was in the very act of taking aim, when the queen perceiving him, gave a sudden scream, and exclaimed to Bothwell that he surely would not disgrace her so far as to murder a man who stood under her protection. With that frank honesty which was natural to him, Kirkaldy told her that it was of absolute necessity, if she ever expected to enjoy the services and the confidence of her subjects, that she should abandon Bothwell, who was the murderer of her husband, and who could never be a husband to her, having been so lately married to the sister of the Earl of Huntly. Bothwell, who stood near enough to overhear part of this colloquy, offered to vindicate himself by single combat from the charge of any one who should accuse him of murdering the king. Grange told him he should have a speedy answer; and returning to the lords, found little difficulty in persuading them of the propriety of his accepting the challenge, which he did without hesitation. Bothwell, however, thought it prudent to decline, on the plea that Kirkaldy, being only a baron, was not his equal. To the laird of Tullibardine he objected on the same ground. The Lord Lindsay then came forward, whom he could not refuse on the score of inequality; but he finally declined to engage. The queen then sent again for Grange, and proposed surrendering herself to the

lords. Bothwell in the meantime made his escape. The queen holding out her hand, Kirkaldy kissed it, and taking her horse by the bridle turned him about, and led her down the hill. This was almost the full measure of Mary's humiliation, which was accomplished by her entry into Edinburgh amidst the execrations of the rabble. The lords (particularly Kirkaldy) were still willing to treat her with kindness, if she could have been prevailed on to abandon Bothwell. The same night, however, she wrote a letter to him, calling him "her dear heart, whom she should never forget nor abandon, though she was under the necessity of being absent from him for a time;" adding, that she had sent him away only for his own safety, and willing him to be comforted, and to be watchful and take care of himself. This letter falling into the hands of the lords, convinced them that her passion for Bothwell was incurable; and they determined to secure her in Lochleven. Grange alone wished to excuse her, and hoped that gentle usage might yet reclaim her; but they showed him her letter to Bothwell, which left him no room to speak more on her behalf. The queen, in the meantime, sent him a letter, lamenting her hard usage, and complaining of broken promises. He wrote to her in return, stating what he had already attempted in her behalf, and how his mouth had been stopped by her letter to Bothwell; "marvelling that her majesty considered not that the said earl could never be her lawful husband, being so lately before married to another, whom he had deserted without any just ground, even though he had not been so hated for the murder of the king her husband. He therefore requested her to dismiss him entirely from her mind, seeing otherwise that she could never obtain the love or respect of her subjects, nor have that obedience paid her which otherwise she might expect." His letter contained many other loving and humble admonitions, which made her bitterly to weep. Eager to free the queen and the nation of Bothwell, Grange most willingly accepted the command of two small vessels that had been fitted up from Morton's private purse (for Bothwell had not left a sufficient sum for the purpose in the Scottish treasury), with which he set sail towards Orkney, whither it was reported Bothwell had fled. He was accompanied by the laird of Tullibardine and Adam Bothwell, Bishop of Orkney. Bothwell having made his escape from Orkney, was pursued by Grange to the coast of Norway, where, at the moment when they had almost overtaken the fugitive, the impetuosity of Kirkaldy, who called on the mariners to hoist more sail than the vessel was able to carry, lost them their prize, and they were wrecked on a sandbank. Bothwell escaped in a small boat to the shore, leaving his ship and his servants a prey to Kirkaldy. This unhappy man fled to Denmark, and the method of his end is too well known to be repeated.

The Regent Moray was in the meantime establishing order and tranquillity generally through the country. The king, an infant, had been crowned at Stirling, and his authority in the person of the regent very generally acknowledged, when the queen, making her escape from Lochleven, and putting herself into the hands of the Hamiltons, created new and serious calamities. The regent being at that time in Glasgow holding his justice-eye, was just at hand, and meeting with the queen and her followers at Langside, on the way for Dumbarton Castle, gave them, though they were far more in number than all the king's friends that he could muster, an entire overthrow. The regent led the battle himself, assisted by Grange, who, being an experienced soldier, was

¹ Pitcairn's *Crim. Trials*, i. (p. i.) 466, 478.

appointed to oversee the whole battle; to ride to every wing, and to encourage and make help wherever it was most required. The dispositions of the regent were excellent, and his followers behaved with great courage; so that the victory was soon won, and there being few horsemen to pursue, and the regent calling out to save and not to kill, there were not many taken or killed; the greatest slaughter, according to Sir James Melville, being at the first rencounter by the shot of some troops that were planted behind the dykes at the head of the lane leading up to the village.

Having taken the command of the castle of Edinburgh from Sir James Balfour, the regent bestowed it upon Grange, who appears to have had the principal direction of affairs during the time that Moray, through the intrigues of the queen's faction, was called up to the conferences at York. Lethington, subtle, restless, and changeable, had by this time turned to the queen's side, whom he almost openly owned during the time of these conferences, and he had imposed upon the unsuspecting disposition of Grange, enticing him into a kind of doubtful neutrality, which had an unhappy influence upon the public cause, and ended fatally for Grange himself. Lethington and Sir James Balfour having been both at last arrested under an accusation of having been concerned in the king's murder, Grange took them into his own hands and protected them in the castle, which he refused to deliver up to the regent. On the murder of the Regent Moray in 1570, it did not immediately appear what party Grange would embrace. It was evident, however, that for some time previous to this event he had leaned to the side of the queen, and the castle of Edinburgh in a short time became the resort and general rendezvous of all who opposed the party of the prince.

The Earl of Lennox succeeding to the regency was supported by Elizabeth, who sent an army into Scotland for that purpose, and to retaliate upon some of the border chieftains who had made inroads into the English territories, particularly Buccleugh and Fernihurst. Grange, in the meantime, by the orders of the queen's faction, who now assembled parliaments of their own, liberated all those who had been formerly given him in charge as prisoners, for their opposition to the king in the person of the regent. These dispersing themselves over the country, some pretending to be employed in a civil, and others in a military capacity, carried dissension and rebellion along with them, to the entire ruin of the miserable inhabitants. Lord Seton, to intimidate the citizens of Edinburgh, who in general leaned to the side of the king, assembled his vassals at Holyrood House, while the Hamiltons, with the whole strength of their faction, assembled at Linlithgow, when they made a sudden and unexpected attack upon the castle of Glasgow, the residence of Lennox the regent. Coming upon the place by surprise, they gained the court and set fire to the great hall; but they were soon repulsed, and the approach of the king's army, a principal part of which was English, compelled them to raise the siege. The Hamiltons suffered most severely on this occasion, their lands in Clydesdale being ravaged, Cadzow plundered, and the town of Hamilton, with the seat of the Hamiltons, burned to the ground. Nor did this suffice; they also burned the house of the Duke of Chatelherault in Linlithgow, the palace of Kinnoull, the house of Pardovan, and Bynie, Kincavil, and the chapel of Livingstone.

Grange, meanwhile acting somewhat dubiously, and not supporting the extreme measures of either of the parties, was confounded to see a foreign foe in

the heart of the kingdom, and Mary's friends used with such extreme rigour; and afraid of being entrapped himself, began to fortify the castle with all haste, and lay in everything necessary for a siege. Lennox in the meantime summoned an army in the king's name to attend him, with twenty days' provision, and to complete his equipments he applied to Grange for some field-pieces. The request was, however, refused, under a pretence that he would not be accessory to the shedding of blood. The purpose of this armament was to interfere with a parliament which the queen's party intended to have held at Linlithgow, which it effectually accomplished; and in the following month (October) Lennox held one for the king in Edinburgh. The insignia of royalty being supposed necessary to the legality of parliaments, they were demanded from Grange, who flatly refused them, and from that time forth he was regarded as determinedly hostile to that cause for which he had done and suffered so much. Through the mediation of Elizabeth, however, who was at the time amusing Mary and her friends with proposals for restoring her to some part of her authority, a cessation of hostilities was agreed upon for two months, which being renewed, was continued till the succeeding April, 1571.

The truce, however, was not strictly observed by either of the parties. Fortresses were taken and retaken on both sides oftener than once, and in the month of April, Dumbarton Castle, reckoned impregnable, was taken by surprise by the friends of the regent, who, on a sentence of forfeiture in absence, hanged Hamilton, Archbishop of St. Andrews, who had taken refuge in the place. Alarmed at the fate of Dumbarton, Grange repaired the walls of the castle, cut away all the prominences on the rock, and smoothed the banks to prevent the possibility of an escalade. He also prepared the steeple of St. Giles for receiving a battery, and carried away the ordnance belonging to the town. His brother James at the same time arrived from France with "ten thousand crowns of gold, some murrions, corslets, hagbuts, and wine, which was saiffie convoyt from Leyth be the horsemen and soldiers of the town." All men who favoured not the queen were now commanded to leave the town, and even his old tried friend and fellow-sufferer, John Knox, was obliged to quit his place, which was supplied by Alexander, Bishop of Galloway. The regent's soldiers, however, took possession of some ruinous houses close to the walls, whence they annoyed the town. There was now an end to all business; public worship ceased, and there was nothing to be heard but the thundering of artillery. The queen's party had now, however, the pride of also holding a parliament in Edinburgh, which declared the demission of Mary null; forbade any innovation to be made in the Presbyterian religion; and after two or three hours' deliberation, rode in procession from the Canongate to the castle, having the regalia borne before it. Prayers for the queen were ordered by this meeting, and all who omitted them were forbidden to preach. During these proceedings there were daily skirmishes on the streets, and the regent still kept possession of Holyrood House. In the month of August, in this year, an envoy arrived from the King of France, with money, arms, and ammunition for Grange; but the money fell into the hands of the regent. In the ensuing month Grange laid a plan for seizing the regent at Stirling, and bringing him safe to the castle, which failed of success only through the imprudence of those who conducted it. The regent was actually made a prisoner, and on the road for Edinburgh, when, principally through the valour of Morton, he was

rescued, but shot by one of the party when they saw they could not carry him away. David Spens of Wormiston, who had him in charge, and used every endeavour to save him, was also shot in revenge, though the wounded regent attempted to protect him. This was unfortunate for Grange. Mar was immediately elected regent; a man of far higher merit, and much more respected, than Lennox, and in still greater favour with the ministers of Elizabeth; and he in the end proved too strong for the misled though patriotic Grange. The war now assumed the most ferocious character. Morton destroyed the whole of Grange's property in Fife. Grange on the same day retaliated by burning Dalkeith; and for upwards of two months they reciprocally hanged their prisoners.

The distress of the town and the surrounding districts now became extreme; the poor were turned without the gates, and the empty houses pulled down and sold for fuel; a stone weight being sold for what would purchase a peck of meal. Through the mediation of the English and French ambassadors an armistice was at last agreed to, and all the differences between Morton and Grange nearly made up. Through the intrigues of Maitland, however, who had gained an extraordinary influence over him, Grange rose in his demands, and nothing was accomplished further than a renewal of the truce. In the meantime Mar, who was a sincere, good man, and truly devoted to the public interests, died, and was succeeded by Morton, a man of great address, and the mortal enemy of Maitland. He too, however, professed to desire peace, and offered the same terms as Mar. Grange was to deliver up the castle in six months, and a convention was called to consider the means of effecting a double peace. Both parties were at the same time attempting to overreach each other. Morton thirsted for the wealthy estates of some of the queen's adherents; and the queen's adherents wanted to gain time, in the hope of procuring effectual aid from France. The Hamiltons, Huntly, Argyle, and their followers, were now weary of the war; and in a meeting at Perth accepted of the terms offered by Morton, and, according to Sir James Melville, abandoned Grange, who would willingly have accepted the same terms; but from that time forth Morton would not permit the offers to be mentioned to him. The day of the truce had no sooner expired than a furious cannonade was commenced by Grange on the town from the castle. He also shortly after, on a stormy night, set fire to the town, and kept firing upon it to prevent any person coming forth to extinguish the flames; a piece of wanton mischief, which procured him nothing but an additional share of odium. Being invested by the Marshal of Berwick, Sir William Drury, with an English army, the garrison was soon reduced to great straits. Their water was scanty at best, and the falling of one of the chief towers choked up their only well. The Spur, a building of great strength, but imperfectly manned, was taken by storm, with the loss of eight killed and twenty-three wounded. Sir Robert Melville, along with Grange, were, after beating a parley, let over the walls by ropes, for the gate was choked up with rubbish. They demanded security for their lives and fortunes, and that Maitland and Lord Hume might go to England, Grange being permitted to go or stay as he might deem best. These conditions not being granted, they returned to the garrison, but their soldiers refused to stand a new assault, and threatened in case of another that they would hang Lethington, whom they regarded as the cause of their protracted defence, over the wall. Nothing remained therefore but an unconditional

surrender; and so odious were the garrison to the citizens, that an escort of English soldiers was necessary to protect them from the rabble. After three days they were all made prisoners. Lethington died suddenly, through means, it has been supposed, of poison, which he had taken of his own accord. Grange, Sir James Kirkaldy (his brother), James Mossman and James Leckie, goldsmiths, were hanged on the 3d of August, 1573, and their heads afterwards set up on the most prominent places of the castle-wall.¹

Thus ignominiously died one of the bravest warriors of his age; the dupe of a volatile and crafty statesman, and of his own vanity to be head of a party. He had been one of the earliest friends, and during its first days of peril one of the most intrepid defenders, of the Reformation. Knox, who knew and loved him well, lamented his apostasy, and with that sagacity which was peculiar to his character admonished him of the issue. "That man's soul is dear to me," said Knox, "and I would not willingly see it perish; go and tell him from me, that if he persists in his folly, neither that crag in which he miserably confides, nor the carnal wit of that man whom he counts a demi-god, shall save him; but he shall be dragged forth and hanged in the face of the sun." Kirkaldy returned a contemptuous answer dictated by Maitland; but he remembered the warning when on the scaffold with tears, and listened with eagerness when he was told the hope that Knox always expressed, that though the work of grace upon his heart was sadly obscured, it was still real, and would approve itself so at last; of which he expressed with great humility his own sincere conviction.

KIRKWOOD, JAMES, an eminent teacher and writer on grammar, in the latter part of the seventeenth century, was born near Dunbar. The circumstances of his education are unknown; he was first schoolmaster of Linlithgow, and subsequently of Kelso. His school at Linlithgow was one of considerable reputation, and he would appear to have been intrusted, like many teachers of the present day, with pupils who boarded in his house. The celebrated John, second Earl of Stair, was thus educated by him. The first work ascertained to have been published by him was an *Easy Grammar* of the Latin language, which appeared at Glasgow in 1674. In 1677 he published at London an octavo fasciculus of *Sentences* for the use of learners. In the succeeding year appeared his *Compendium of Rhetoric*, to which was added a small treatise on *Analysis*. After the Revolution he was sent for by the parliamentary commissioners for colleges, on the motion of Lord-president Stair; and his advice was taken about the best Latin grammar for the Scottish schools. The lord-president asked him what he thought of *Despauter*. He answered, "A very unfit grammar; but by some pains it might be made a good one." The Lord Crossrigg desiring him to be more plain on this point, he said, "My lord-president, if its superfluities were rescinded, the defects supplied, the intricacies cleared, the errors rectified, and the method amended, it might pass for an excellent grammar." The lord-president afterwards sent for him, and told him it was the desire of the commissioners that he should immediately reform *Despauter*, as he had proposed; as they knew none fitter for the task. He accordingly published, in 1695,

¹ In the case of Kirkaldy there appears to have been considerable debate on the relevancy of the indictment on which he was tried, too technical to be interesting to the general reader.—Pitcairn's *Crim. Trials*, ii. 3.

a revised edition of *Desputer*, which continued to be commonly used in schools till it was superseded by Ruddiman's *Rudiments*. Kirkwood was a man of wit and fancy, as well as of learning; and having fallen into an unfortunate quarrel with his patrons the magistrates, which ended in his dismissal, he took revenge by publishing a satirical pamphlet, entitled *The Twenty-seven Gods of Linlithgow*, meaning thereby the twenty-seven members of the town-council. He appears to have afterwards been chosen schoolmaster at Kelso, where he probably died.

KNOX, JOHN, the most eminent promoter of the Reformation in Scotland, was born at Haddington in the year 1505. His father, though himself a man of no note, was descended from the ancient house of Ranfurly in the shire of Renfrew. Of the mother of the great reformer nothing farther is known than that her name was Sinclair—a name which he frequently used in after-life, when to have subscribed his own would have exposed him to danger: thus many of his letters in times of trouble are signed "John Sinclair." Though a man of no rank in society, his father would yet seem to have been possessed of a competency beyond that of the ordinary class of the peasantry of the times, if such an inference be permitted from the circumstance of his having given his son an education which was then attainable only by a very few. This is a point, however, on which there has been also much dispute; some representing his parents as in a "mean condition," others as persons of extensive property. Whatever may have been the condition of his parents—a matter of little moment—there is no doubt regarding the only circumstance of any importance connected with the question, namely, that he received a liberal education.

His course of learning began at the grammar-school of Haddington, where he acquired the elements of the Latin language. He was afterwards, about the year 1524, sent to the university of St. Andrews. From the circumstance of the name "John Knox" appearing on the list of matriculated students for the year 1520, in the Glasgow College, it has been presumed that he studied there also, and this, as appears by the dates, four years previous to his going to St. Andrews; but the supposition that this John Knox was the reformer is much weakened by the fact that many of the Knoxes of Ranfurly, the house from which his father was descended, were educated at the university of Glasgow. Amongst the last of these of any note were Andrew Knox, Bishop of the Isles, and, after him, his son and successor, Sir Thomas Knox. In the absence, therefore, of all other evidence, this circumstance in the life of the reformer must be held as extremely doubtful, especially as no allusion is made to it, either by himself, his contemporaries, or any of the earlier writers who have spoken of him. Knox, when he went to St. Andrews, was in the nineteenth year of his age, and was yet undistinguished by any indications of that peculiar character and temper, or that talent, which afterwards made him so conspicuous. His literary pursuits had hitherto been limited to the acquisition of the Latin language, Greek and Hebrew being almost unknown in Scotland, although at an after period of life Knox acquired them both. His removal to St. Andrews, however, opened up new sources of learning and of knowledge. John Mair, a celebrated doctor of the Sorbonne, who had studied at the colleges of England and Paris, was then principal of St. Salvator's College, St. Andrews. He was a man of no great strength of mind, nor of very high attainments; but he had while in

Paris imbibed, and he now boldly inculcated, civil and religious principles directly at variance with the opinions and practices of the times. He denied the supremacy of the pope, and held that he was amenable to a general council, which might not only rebuke and restrain him, but even depose him from his dignity. He held that papal excommunications were of no force, unless pronounced on just and valid grounds, and that tithes were not of divine origin. He, besides, fearlessly censured the avarice and ambition of the clergy. And with regard to civil matters, his opinions were no less daring, and not less boldly inculcated. He taught his pupils to consider kings as having no other right to their elevation but what proceeded from their people, to whom they were amenable for their conduct, and by whom they might be judicially proceeded against. Such were some of the doctrines taught by Mair; and that they had taken a strong hold of Knox, who was one of his pupils, his after-life sufficiently shows. For we find him, with the courage which belonged to his character, practising himself, and showing others how to practise, that which his preceptor only taught.

In the studies of the times Knox now made rapid progress. He was created Master of Arts, and ordained a priest before he had attained the age (twenty-five) appointed by the canon-law for receiving ordination. It will not perhaps be lost time to pause for a moment at this period of his life, since it presents us with the interesting sight of a great mind slumbering in its strength, and unconscious at once of the darkness with which it was surrounded, and of there being a brighter and a better world beyond the narrow precincts which it had been taught to consider as the utmost limits of its range. Here we find the great reformer, passively and without remark or objection, becoming a minister of that church which he was afterwards to overturn and erase from his native soil; becoming a minister of that religion which he was afterwards to drive from the land, with a violence which shook both the kingdom and the throne. A little longer, however, and we find this mighty mind emerging gradually but majestically into the light of day. The discovery had been made that there lay a wider and a fairer region beyond the bounds of the prison-house, and Knox hastened himself to seek and to point out the way to others.

He soon betook himself to the study of the writings of the fathers of the Christian church; and, in the works of Jerome and Augustine, found the doctrines and tenets which effected that revolution in his religious sentiments, afterwards productive of such important results. He was now in the thirtieth year of his age, but he did not either publicly avow the change which had taken place in his religious creed, or attempt to impress it upon others, for several years afterwards. In the meantime the work of reformation had been making irregular but rapid progress. Patrick Hamilton had already preached the new faith in Scotland, and had fallen a martyr to its doctrines, and several others of not less zeal, but of less note, had shared a similar fate. Copies of the Scriptures were now surreptitiously introduced into the kingdom, and eagerly read by those into whose hands they fell. Poets employed their fascinating powers in bringing the Church of Rome and its ministers into contempt. The effect of all this was a violent agitation of the public mind. The reformed doctrines were everywhere spoken of and discussed. They became the topics of common conversation, and were the themes of disquisition amongst the learned. It was at this critical period, about

the year 1542, in the midst of this feverish excitement of public opinion, that Knox first stepped into the arena as a combatant in the cause of the new faith. He was still a teacher of philosophy in the college of St. Andrews, but he availed himself of the opportunities which this appointment afforded of disseminating his doctrines amongst his pupils, whom he taught to look with abhorrence and contempt on the corruptions and errors of the Romish church. Though such opinions were now spreading widely, and were made matter of ordinary discussion, their abettors were not yet by any means safe from the vengeance of the Romish ecclesiastics, who were still struggling hard to suppress the heresies which were everywhere springing up in the land, and threatening the speedy ruin of their church. Knox's case was too marked and too conspicuous an instance of defection to escape for any length of time some proof of that wrath which it was so well calculated to excite. He was degraded from the priesthood, had sentence passed against him as a heretic, and only escaped assassination by fleeing from St. Andrews, that fate having been marked out for him by Cardinal Beaton. On leaving St. Andrews Knox found protection in the family of Douglas of Langniddrie, where he acted in the capacity of tutor. Here, Douglas himself being a zealous advocate for the new faith, Knox continued to preach the doctrines which had driven him from St. Andrews; and in these doctrines he not only instructed the family with which he lived, but also the people in the neighbourhood, whom he invited to attend his prelections. From the consequences which must infallibly have attended this perseverance in disseminating principles so inimical to the church, Knox was only saved by the death of Cardinal Beaton, who was assassinated in the castle of St. Andrews, on the 29th of May, 1546. Though, by the death of Beaton, Knox probably escaped the utmost severities which prelate could inflict, he yet did not escape all visitation from its wrath. John Hamilton, the successor of Beaton, sought his destruction with as much eagerness as his predecessor had done, compelling him to flee from place to place, and to seek his safety in concealment. Apprehensive of falling at last into the hands of his enemies, he, after having led a vagrant and miserable life for many months, at length sought an asylum in the castle of St. Andrews, which had been in the possession of the cardinal's assassins since the period of his death, and which they had held out against repeated attempts of the Earl of Arran, then Regent of Scotland, to take it. Knox entered the castle of St. Andrews at the time of Easter, 1547. This step he had been prevailed upon to take by two of his warmest friends, the lairds of Langniddrie and Ormiston, at a time when he had himself determined to retire to Germany.

The circumstance of Knox's having taken shelter, on this occasion, with the assassins of Beaton, has given rise to reflections on his character, involving charges of the most serious nature. Some of them are wholly unfounded, others unreasonable. He has been accused of being one of the conspirators who projected the death of Beaton; which is totally unsupported by any evidence, and must therefore, in common justice, be utterly rejected. He has been said to have made himself accessory to the crime of the cardinal's murder by taking shelter amongst those by whom it was perpetrated—a most unreasonable and unwarrantable conclusion. His own life was in imminent danger, and he naturally sought shelter where it was most likely to be found, without reference to place or circumstances, and we cannot see by what reasoning he could be reduced to the dilemma

of either sacrificing his own life or submitting to be accused as an accessory to murder; the one consequence threatening him by his remaining at large, the other by his fleeing to a place of refuge. He has been accused of vindicting the deed in his writings. This length he certainly has gone; but, considering all the circumstances connected with it, such vindication on the part of Knox is not much to be wondered at, nor is it calculated to excite much reasonable prejudice against him. Beaton eagerly sought his life; he was his personal enemy, and a relentless and cruel enemy to all who were of the same faith. If, therefore, we are called upon to disapprove of Knox's justification of the death of Beaton, we should at the same time be permitted to remark that it was an event which he had but little reason to regret.

After entering the castle of St. Andrews, Knox resumed his duties as a teacher, and proceeded to instruct his pupils as before. He also resumed his lectures on the Scriptures, and regularly catechised his hearers in the parish church of the city. Hitherto Knox's appearances as a disciple and teacher of the reformed doctrines had been rather of a private character, or at least only before select audiences, such as his own class of pupils, or a few neighbours congregated together, as at Langniddrie. He was now, however, about to come forward in a more public, or at least more formal, capacity. At the time that he sought refuge in the castle of St. Andrews there were three persons of note there, all zealous reformers, who had also fled to it as a sanctuary. These were Sir David Lindsay of the Mount, Henry Balnaves of Hallhill, and John Rough, a celebrated reformed preacher, and who was at this moment publicly preaching in St. Andrews. These persons were so much struck with Knox's talents and his manner of instructing his pupils, that they earnestly exhorted him to come publicly forward as a preacher of the reformed doctrines. This, however, Knox declined; not from any unwillingness to expose himself to the dangers which then attended the discharge of such a duty, nor from any reluctance to devote himself to the great cause which he had espoused, and of which he was afterwards so singular a promoter; but from a feeling of diffidence in his own powers, and a deep sense of the awful importance of the charge to which he was invited; he besides entertained some scruples as to the regularity of the call which was now made upon him, and, with a conscientiousness and feeling of delicacy which became his religious professions, expressed a fear that his coming forward as a preacher, on the summons of only two or three individuals, might be deemed an intrusion into the sacred office of the ministry.

Bent on their object, however, the three persons above named, without Knox's knowledge, consulted with the members of the church in which Rough preached, and the result was the fixing of a certain day when Knox should, in the name and in the face of the whole congregation, be called upon by the mouth of their preacher to accept the office of the ministry. On the day appointed, and while Knox was yet wholly unaware of what was to take place, Rough, after preaching a sermon on the election of ministers, in which he maintained the right of a congregation, however small its numbers, to elect its own pastor (and he farther maintained that it was sinful to refuse to obey such a call when made); then suddenly turning to Knox—"Brother," he said, "you shall not be offended although I speak unto you that which I have in charge, even from all those that are here present, which is this—In the name of God and of his Son Jesus Christ, and in the name of all that presently call you by my mouth, I charge you that you

refuse not this holy vocation, but, as you tender the glory of God, the increase of Christ's kingdom, the edification of your brethren, and the comfort of me, whom you understand well enough to be oppressed by the multitude of labours, that you take the public office and charge of preaching, even as you look to avoid God's heavy displeasure, and desire that he shall multiply his graces unto you." Turning now to the congregation, "Was not this your charge unto me?" he said, "and do ye not approve this vocation?" "It was, and we approve it," was the reply. Deeply impressed with the circumstance, Knox made an attempt to address the audience, but his feelings overcame him; he burst into tears, and rushed out of the church. Though not without the hesitation and the doubts and fears of an ingenuous and religious mind, Knox accepted the charge thus solemnly and strikingly imposed upon him, and on an appointed day appeared in the pulpit. On this occasion, a highly interesting one, as being the first public appearance of the great reformer as a preacher of the gospel, he gave out the twenty-fourth and twenty-fifth verses of the seventh chapter of Daniel—a choice which shows the great changes which he already anticipated in the religious establishments of the land, and the confidence with which he looked forward to the result of the contest now begun with the Church of Rome. The sermon which he preached on this occasion subjected him to the high displeasure of the church dignitaries; he and Rough were summoned before a convention of learned men to answer for the heretical doctrines which they entertained and promulgated. In the controversy which took place in this assembly between Knox and the person appointed to dispute with him, a grayfriar of the name of Arbutill, on the various points at issue, the former so utterly discomfited his opponent, and so strongly established his own positions, that the Romish clergy, resigning all hopes of maintaining their ground either by scriptural appeals or by force of reasoning, carefully avoided for the future all such exhibitions of public disputation. The castle of St. Andrews, in which Knox still found refuge, was soon after this (June, 1547) besieged by a French fleet, which had been despatched from France to assist the governor in its reduction, and after a stout resistance of several weeks' duration, the garrison was compelled to capitulate, and all within it were made prisoners of war. Knox and all the others who were taken with him were carried on board the French ships, which soon afterwards proceeded with them to France. On their arrival there the greater part of them were distributed throughout different prisons, but Knox, with two or three others, were detained on board the galleys in the Loire during the whole of the succeeding winter. His confinement on ship-board altogether extended to nineteen months. At the end of that long period his liberation took place; and the cause is ascertained to have been the intercession of Edward VI. employed in his behalf.

On obtaining his liberty Knox immediately proceeded to England, where the Reformation was making considerable progress, under the auspices of Archbishop Cranmer and other powerful persons in that kingdom. Knox's reputation as a preacher and zealous reformer was already well known to Cranmer and his colleagues, who were not long in finding him suitable employment. He was despatched by the privy-council to Berwick to preach the reformed doctrines, and was allowed a salary for his maintenance. Here he remained for two years, daily strengthening the great cause in which he was embarked, and weakening that of its opponents. During this period

too great numbers were converted by his powerful reasoning and impressive eloquence; nor were the good effects of his ministry confined to the effecting a beneficial change in the religious sentiments of his hearers; their morals and manners were also greatly improved by the force of his example, and the striking truths exhibited in his precepts. While in Berwick, Knox was involved in another controversy or public disputation similar to that in which he had been engaged in St. Andrews. The scene on this occasion was Newcastle, whither he had been summoned by the Bishop of Durham to appear before an assembly of the learned men of his cathedral to discuss the doctrines which he taught. These Knox defended with his usual ability, and with his usual success. He retired triumphant from the debate, leaving his opponents silenced and confounded by the ingenuity and strength of his arguments, and the fervour and energy of his eloquence.

His reputation was now daily spreading wider and wider, and so highly did the privy-council appreciate the value of his services, that they conferred on him in December, 1551, a singular mark of their approbation, by appointing him one of the king's chaplains. While residing in Berwick Knox formed an acquaintance with a young lady of the name of Marjory Bowes. This lady afterwards became his wife, but without the consent of her father, who could never be induced to approve of the connection. He, however, had a warm friend in the young lady's mother, who not only gave her sanction to the marriage of her daughter, but used every effort, though without effect, to reconcile her husband to the union. Family pride, together with some differences of opinion in religious matters, are supposed to have been the cause of Mr. Bowes' objection to accept the reformer as a son-in-law. As a natural result, the malevolence of Knox's enemies, those who adhered to Popery, kept pace with the success which attended his efforts against the Romish church. They narrowly watched his every word and action, and at length laying hold of some expressions of a political nature which they conceived might be employed to his prejudice, they denounced him to the privy-council. In consequence of this charge, which was supported by the Duke of Northumberland, who entertained a personal dislike to Knox, he was summoned up to London. The result, however, was in the highest degree favourable to him. He not only convinced the council of the uprightness of his intentions and the malice of his accusers, but succeeded in gaining a yet greater degree of favour with that body than he had before enjoyed. He was appointed to preach to the court, and gave such satisfaction in the discharge of this duty, that the privy-council determined to invite him to preach in London and the southern counties during the following year. They offered him the living of All-Hallows in the city. He, however, declined the appointment, as also that of a bishopric, which was soon afterwards tendered him at the special request of the king, by whom he was much esteemed. These splendid offers of promotion he refused for conscience' sake—there being several things connected with the English ecclesiastical establishment repugnant to the faith which he had adopted, such as the reading of homilies, the chanting of matins and even-song, the prevalence of pluralities, &c.

In the meantime the king, Edward VI., who had evinced so much readiness to patronize our reformer, died, and was succeeded by one of the most sanguinary and relentless enemies which the reformed religion had, during any period, to contend with. This was Mary. The accession of this princess to the

throne totally altered Knox's situation and his views. Her bigotry and persecution soon made England unsafe for him to live in it.

Finding his danger becoming daily more and more imminent, he at length came to the resolution, though not without much reluctance, of retiring to the Continent; and making choice of France, proceeded to Dieppe in that kingdom in the year 1554. Here he remained till the latter end of the following year, occasionally visiting Geneva, then the residence of the celebrated Calvin, with whom he formed a close intimacy. At the latter end of the autumn of 1555 Knox returned to Scotland, induced by the temporary favour which the queen-dowager, Mary of Lorraine, had extended to the Protestants in her dominions. As this favour, however, did not proceed from any feeling of regard for those who had adopted the new faith, but was employed as a means of checking the clergy who had been averse to the dowager's obtaining the regency of the kingdom, it was of short duration, and lasted only so long as that princess thought it necessary to her interests. In the meantime Knox was zealously and industriously employed in disseminating the doctrines of the reformed religion. He went from place to place preaching the gospel, and gradually increasing the number of his disciples, amongst whom he was soon able to reckon some of the first persons in the kingdom. While thus employed, he received an invitation from an English congregation at Geneva to become their pastor. With this invitation he thought it his duty to comply, and accordingly proceeded thither in the month of July, 1556. He was on this occasion accompanied by his wife and mother-in-law, the husband of the latter being now dead. On learning that he had left Scotland, the clergy there proceeded to evince those feelings regarding him which they had not dared to avow, or at least to act upon, while he was present. Knowing that he could not appear, they summoned him before them, passed sentence against him in absence, adjudging his body to the flames, and his soul to damnation. The first part of the sentence they made a show of carrying into effect, by causing his effigy to be burned at the cross of Edinburgh. On reaching Geneva he immediately took charge of his congregation, and spent the two following years in promoting their spiritual interests. This was perhaps the happiest period of Knox's life. He lived upon the most affectionate footing with the members of his church, by all of whom he was greatly beloved. He enjoyed the society and friendship of Calvin, and the other ministers of the city; and to complete his felicity, he lived in the bosom of his own family, a happiness of which he had hitherto had but a small share. No degree of enjoyment, however, or of earthly felicity, could wean him from the desire of promoting the Reformation in his native country; to this he continued to look forward with unabated eagerness, and only waited for more favourable times to gratify this ruling passion of his life.

When he had been about two years in Geneva, the long-cherished wishes of our reformer to exercise his ministry in his native land seemed about to be realized. Two persons, citizens of Edinburgh, the one named James Syme, the other James Barron, arrived in Geneva with a letter signed by the Earl of Glencairn, the lords Lorn and Erskine, and Lord James Stewart, an illegitimate son of James V., and afterwards Earl of Moray, inviting him to return to Scotland. Knox immediately obeyed the call, and had proceeded as far as Dieppe on his way to Scotland, when he received letters from the latter country containing the most discouraging accounts of the state

of the kingdom and of the Protestant interest there. Grieved and disappointed beyond expression, he again returned to Geneva, where he remained for another year. During this period he assisted in making a new translation of the Bible into English, and also published his *Letter to the Queen Regent*, his *Appellation and Exhortation*, and *The First Blast of the Trumpet against the Monstrous Regiment of Women*. Matters having at length taken a more favourable turn in Scotland, the Protestant lords sent a second invitation to Knox to join them, accompanied by the gratifying intelligence that the queen-regent had promised them her countenance and protection. He placed little reliance on these promises, but he readily obeyed the call of his friends to return to his native country.

He sailed from Dieppe on the 22d of April, and arrived safely in Leith on the 2d of May, 1559. The distrust which Knox entertained of the good faith of the queen-regent was not without sufficient cause. By the time he arrived, that artful and able princess, conceiving that she had no longer any occasion for assistance from the Protestants, not only gave them to understand that they had nothing more to hope from her, but openly avowed her determination to suppress the Reformation by every means in her power, and to employ force for that purpose if it should be found necessary.

In this spirit she authorized Archbishop Hamilton to summon the reformed preachers before him in St. Andrews to answer for their conduct, giving him at the same time a similar assurance of protection and support with that which she had a short while before given to the Protestants. A threat, however, having been conveyed to her that the preachers would not go unattended to the impending trial, she deemed it prudent to prorogue it until she should be in a better state of preparation, and accordingly wrote to the primate to delay any further proceedings in the matter for the time. On the faith of receiving assistance from France, which had united with Spain for the extirpation of heresy, she soon after resumed the process against the Protestant preachers, and summoned them to stand trial at Stirling. Thither Knox, though he had been proclaimed an outlaw and a rebel, by virtue of the sentence formerly pronounced against him, determined to repair to assist his brethren in their defence, and to share the dangers to which they might be exposed; but the artifice of the queen-regent deprived him of the opportunity of carrying this generous resolution into effect.

The preachers in their progress to Stirling were attended by large bodies of people, who had determined to abide by them during the impending trial. Unwilling, however, to give the queen-regent any offence by approaching her in such numbers, they halted at Perth, and sent Erskine of Dun before them to Stirling to assure her that they meditated no violence nor entertained any but the most peaceable intentions. Unsatisfied by this representation at the approach of so great a multitude, she had recourse to dissimulation to prevent their coming nearer. She informed Erskine that she would stop the trial if he would prevail upon his brethren to desist from their journey. Unsuspicious of the deception she meditated, Erskine was persuaded to write to the assembled Protestants, requesting them to proceed no further, and intimating that he was authorized by the queen to promise them that no trial of their preachers should take place. Rejoiced by these very welcome and very unexpected overtures, they instantly complied, and the greater part of them returned to their homes. But when the appointed day of trial came, the summonses of the

preachers were called in court by the express orders of the queen. They were outlawed for non-appearance, and all persons prohibited under pain of rebellion from harbouring or assisting them.

When this infamous proceeding took place, Knox was with the rest of his brethren at Perth, where he had preached a sermon against idolatry and the celebration of mass, on the very day on which intelligence reached that place of what had occurred at Stirling. On the conclusion of the sermon a priest who was present had the impudence to uncover an altar-piece on which were some images, and prepared to celebrate mass, regardless of the excited state of the public feeling, which had just been roused by the eloquence of Knox, and armed, as it were, for violence by the duplicity of the regent. Under these circumstances little was required to bring on a crisis, and that little was not long wanting. A boy having uttered some disrespectful expressions, was instantly struck by the hot-headed priest. The boy retaliated by throwing a stone, which, missing his assailant, for whom it was intended, struck the altar and broke one of the images. This fired the train. In an instant all the interior decorations of the church were torn down and destroyed, altar and images were overturned and trampled under foot; a mob collected outside, but finding the work of destruction already completed here, they proceeded to the monasteries, which they in a short time laid in ruins. This was the first ebullition of popular feeling connected with the Reformation, and Knox has been accused of having been the cause of it. If he was, he certainly was so unconsciously and innocently, for he reprobated the violence which had taken place, and in speaking of it says it was perpetrated by "the rascal multitude"—language sufficiently indicative of the light in which he viewed it. The Protestant lords, finding now that they had not only nothing more to hope for from the queen, but that she was their declared enemy, determined to make a vigorous effort to establish the reformed religion without either her assistance or consent. They proceeded to ascertain the numbers of their friends, established a correspondence with them, and united the whole by procuring their subscriptions to a religious covenant—copies of which they despatched for that purpose to different districts throughout the country. These thus united were distinguished by the name of the Congregation, and the noblemen who were included by that of the Lords of the Congregation. The latter, still desirous of accomplishing their purpose rather by the force of reasoning than by the sword, engaged Knox to meet them on a certain day at St. Andrews, where they proposed he should deliver a series of sermons. On his way to St. Andrews he preached at Anstruther and Crail, and arrived at the first-named place on the 9th of June.

Here occurred a striking instance of that personal intrepidity for which the great reformer was so remarkable. The archbishop, informed of his design to preach in his cathedral, assembled an armed force, and sent word to Knox, that if he appeared in the pulpit he would order the soldiers to fire upon him. Alarmed for his safety, Knox's friends endeavoured to dissuade him from preaching, but in vain. "He could take God to witness," he said, "that he never preached in contempt of any man, nor with the design of hurting an earthly creature; but to delay to preach next day, unless forcibly hindered, he could not in conscience agree. As for the fear of danger that may come to me," he continued, "let no man be solicitous, for my life is in the custody of Him whose glory I seek. I desire the hand nor weapon of no man to defend me." Knox accordingly ap-

peared in the pulpit at the appointed time, and preached to a numerous assembly, without experiencing any interruption; but although the threatened attempt upon his life was not made, he retains a full claim to all the courage which a contempt and defiance of that threat implies.

On this occasion he preached for three successive days; and such was the effect of his eloquence and the influence of his doctrine, that both the inhabitants and the civil authorities agreed to set up the reformed worship in the town. The monasteries were demolished, and the church stripped of all images and pictures. The example of St. Andrews was soon after followed in many other parts of the kingdom. At the latter end of the month Knox arrived with the forces of the Congregation in Edinburgh, and on the same day on which he entered the city, he preached in St. Giles', next day in the Abbey Church, and on the 7th of July the inhabitants met in the Tolbooth, and appointed him their minister, there being then only one place of worship in Edinburgh, viz. St. Giles' Church. In this charge, however, he was not long permitted to remain. The forces of the regent soon after obtained possession of the city; and, although against his own inclination, his friends prevailed upon him to retire from the town. On leaving Edinburgh he undertook a tour of preaching through the kingdom; and in less than two months had gone over the greater part of it, disseminating with the most powerful effect the doctrines of the reformed religion. He next retired to St. Andrews, where he officiated as minister for several months; and on the conclusion of the civil war, which the determination of the Congregation to establish the reformed religion, and the regent's efforts to suppress it, had created, he returned to Edinburgh. In 1560, after an arduous struggle and many vicissitudes, the faith for which Knox had fought such a "good fight," seemed to be securely established in the land. The queen-regent was dead, and by the assistance of England—an assistance which Knox had been the chief instrument in procuring—the arms of the forces of the Congregation were completely triumphant.

The accession, however, of Mary to the actual government, who was known to be strongly attached to Popery, again excited the fears of the Protestants, and of no one more than Knox, who insisted that the invitation sent to France to that princess to ascend the throne of her ancestors should be accompanied by the stipulation that she should desist from the celebration of mass; and when the rest of the council urged that she ought to be allowed that liberty within her own chapel, he predicted that "her liberty would be their thralldom."

A few days after the queen's arrival at Holyrood she sent for Knox, and taxed him with holding political opinions at once dangerous to her authority and the peace of her realm, and with teaching a religion different from that allowed by its princes. Knox entered at great length into these subjects, defending himself and his doctrines with his usual ability and boldness. His language on this occasion was so stern and decisive as to throw the queen into a fit of weeping, but her tears were those of rage rather than sorrow. The arrival of the dinner hour broke off this interesting interview, and Knox retired from the presence with some expressions of good wishes for the queen's happiness. Frequent conferences took place afterwards between the reformer and Mary, but with little increase of regard on either side. On one of these occasions, when he had spoken with even more than his usual boldness, and just as he was about to retire, he overheard some of

the queen's Popish attendants say, "He is not afraid." "Why should the pleasing face of a gentlewoman frighten me?" replied the stout reformer, turning round upon them; "I have looked in the faces of many angry men, and yet have not been afraid beyond measure." Knox's ministerial duties were in the meantime exceedingly laborious. His charge, as already mentioned, was St. Giles' Church, where he had fulfilled these duties since the year 1560. He preached twice every Sabbath, and thrice on other days of the week, besides meeting regularly with his kirk-session once every week for discipline, and with others for exercises on the Scriptures. He also regularly attended all the meetings of the General Assembly and the provincial synod; and at almost every meeting of the former a mission to visit and preach in some distant part of the country was imposed upon him. With the view of relieving him of part of these overwhelming labours, the town-council, in April, 1562, solicited John Craig, minister of Canongate, to undertake the half of his charge. From the difficulty, however, of obtaining an additional stipend, Knox remained without assistance till June in the following year. It has been already said that many interviews took place from time to time between the queen and Knox; these were still occasionally occurring; but their only effect was to increase her dread and dislike of the reformer; and although some instances occurred in which there was something like an approach to a better understanding, yet on the part of the queen it was never sincere; and there is little doubt that she longed for an opportunity of getting rid of so troublesome a subject, whom neither her threats nor blandishments could divert from the strict path of his duty. Such an opportunity as she desired, or at least such a one as she certainly rejoiced in, seemed now unexpectedly to present itself. Two persons, Protestants, were indicted to stand trial for having, with several others, intruded into the palace during a temporary absence of the queen, for the purpose of interrupting the celebration of certain Roman Catholic rites which was about to take place in the chapel of Holyrood. The Protestants of Edinburgh, dreading that the queen would proceed to extremities against these men, requested Knox to write circular letters to the principal gentlemen of their persuasion, detailing the circumstances of the case, and inviting their presence on the day of trial. One of these letters falling into the hands of the Bishop of Ross, he immediately conveyed it to the queen, who again lost no time in laying it before her privy-council, by which it was pronounced treasonable, and the writer was soon afterwards indicted to stand trial in Edinburgh for the crime of high treason.

The queen presided in person at the trial, and with an ill-judged and ill-timed levity, burst into a fit of laughter, when, on taking her seat in court, she perceived Knox standing uncovered at the foot of the table. "That man," she said, pointing to the reformer, "had made her weep, and shed never a tear himself: she would now see if she could make him weep." The trial now proceeded, and after the charge against him had been read, Knox entered upon his defence at great length, and with such self-possession, intrepidity, and ability, that although he had several enemies amongst his judges, he was, by a great majority, acquitted of the crime of which he had been accused. Alluding to the queen's feelings on this occasion, he says in his history, "That night (the evening after the trial) was nyther dancing nor fiddling in the court; for madame was disappointed of hir purpose, quhilk was to have had John Knox in hir will, be vot of hir nobility."

A second attempt on the part of the queen and her husband Darnley to suppress the stern and uncompromising truths, both political and religious, which the reformer continued to proclaim to the world, was soon after made. He had given out a text which occasioned such offence to the stripling king, that on the afternoon of the same day he was taken from his bed and carried before the privy-council, who suspended him from his office. As the suspension, however, was limited to the time of their majesties' residence in the city, it was but of short duration, as they left Edinburgh before the following Sabbath, when Knox resumed his ministry, and delivered his sentiments with the same boldness as before. This occurrence was soon after followed by the murder of Rizzio, the queen's secretary—an event which gave the queen, now at Dunbar, a pretence for raising an army, ostensibly to enable her to resent the indignity which had been shown to her person by the assassins of Rizzio, and to punish the perpetrator of that deed, but in reality to overawe the Protestants. On the approach of the queen and her forces to Edinburgh, Knox, long since aware of the dislike which she entertained towards him, deemed it prudent to leave the city. On this occasion he retired to Kyle, and soon afterwards went to England to visit his two sons, who were there living with some relations of their mother's, who had died in 1560. Knox returned again to Edinburgh after an absence of about five or six months. During that interval two events had taken place which entirely ruined the queen's authority in the kingdom, and left him nothing to fear from her personal resentment: these were the murder of Darnley and her marriage with Bothwell. He therefore resumed his charge without interruption, and proceeded to take that active part in the national affairs, both political and religious, which the times required, and for which he was so eminently fitted; and, soon after, had the satisfaction of seeing the Protestant religion securely established by the laws of the land, and that of the Popish church utterly overthrown by the same authority. During these commotions our reformer in 1564 had married his second wife, a daughter of Lord Ochiltree, who survived him.

In the month of October, 1570, he was struck with apoplexy, and although it only interrupted his preaching for a few days, he never recovered from the debility which it produced.

The irritability of the times and the vindictive spirit of the Popish faction, still animating its expiring efforts, placed the life of the great reformer once more in danger, and once more compelled him to seek safety in flight. His enemies endeavoured first to destroy his reputation by the most absurd and unfounded calumnies; and, failing utterly in these, they made an attempt upon his life. A shot was fired in at the window at which he usually sat; but, happening to be seated at a different part of the table from that which he generally occupied, the bullet missed him, but struck the candlestick which was before him, and then lodged in the roof of the apartment.

Finding that it was no longer safe for him to remain in Edinburgh, he retired to St. Andrews, where he continued till the end of August, 1572, when he again returned to Edinburgh. His valuable and active life was now drawing fast to a close. On the 11th of the November following he was seized with a cough, which greatly affected his breathing, and on the 24th of the same month he expired, after an illness which called forth numerous instances of the magnanimity of his character, and of the purity and fervour of that religious zeal by which he had been

always inspired. He died in the sixty-seventh year of his age, "not so much," says Dr. M'Crie, "oppressed with years as worn out and exhausted by his extraordinary labours of body and anxieties of mind." His body was interred in the churchyard of St. Giles', on Wednesday the 26th of November, and was attended to the grave by all the nobility who were in the city, and an immense concourse of people. When his body was laid in the grave, the regent, who was also at the funeral, exclaimed in words which have made a strong impression from their aptness and truth, "There lies he who never feared the face of man."

KNOX, WILLIAM. "It may not be impertinent to notice that Knox, a young poet of considerable talent, died here a week or two since. His father was a respectable yeoman, and he himself, succeeding to good farms under the Duke of Buccleuch, became too soon his own master, and plunged into dissipation and ruin. His talent then showed itself in a fine strain of pensive poetry, called, I think, *The Lonely Hearth*, far superior to that of Michael Bruce, whose *consumption*, by the way, has been the life of his verses. . . . For my part, I am a bad promoter of subscriptions; but I wished to do what I could for this lad, whose talent I really admired; and I am not addicted to admire heaven-born poets, or poetry that is reckoned very good, *considering*. I had him (Knox) at Abbotsford about ten years ago, but found him unfit for that sort of society. I tried to help him, but there were temptations he could never resist. He scrambled on writing for the booksellers and magazines, and living like the Otways, and Savages, and Chattertons of former days, though I do not know that he was in extreme want. His connection with me terminated in begging a subscription, or a guinea, now and then. His last works were spiritual hymns, and which he wrote very well. In his own line of society he was said to exhibit infinite humour; but all his works are grave and pensive—a style, perhaps, like Master Stephen's melancholy, affected for the nonce."

In this extract from Sir Walter Scott's *Diary*, an outline of the life, moral character, and literary productions of an erring and unfortunate son of genius is briefly sketched; but with the great novelist's wonted perspicuity, sharp intuitive sagacity, and immeasurable good-nature, that never could see a fault where there was a tolerable *per contra* to recommend.

William Knox was born upon the estate of Firth, in the parish of Lilliesleaf, Roxburgh, on the 17th August, 1789, and was the son of an extensive and pastoral farmer in the shires of Roxburgh and Selkirk. As his parents were in comfortable circumstances, he received a liberal education, first at the parish school of Lilliesleaf, and afterwards at the grammar-school of Musselburgh. After having become a tolerable classical scholar, and acquired a taste for reading, especially in poetry and romance, he was sent, at little more than the age of sixteen, to a lawyer's office, not, however, for the purpose of studying the law as a future profession, but of acquiring the general knowledge and practical habits of business. This was necessary, as he was the eldest son of a family of six children, and would naturally succeed to his father's extensive farming; but as a school of morals and virtuous habits, a lawyer's office, at the beginning of the present century, could scarcely be reckoned the happiest of selections. After a few months' training at law, in which he made little progress, he was called home to assist his father; and in 1812 he commenced farm-

ing on his own account, by taking a lease of the farm of Wrae, in the neighbourhood of Langholm. But steady though he appears to have been at this period, so that he soon acquired the reputation of a diligent and skilful farmer, he was so unsuccessful that he lost all interest in agriculture, threw up the lease of Wrae in 1817, and commenced that precarious literary life which he continued to the close. Indeed, while he was ploughing and sowing, his thoughts were otherwise occupied; for even at the schoolboy age, he had been infected, as half of the human race generally are at that ardent season, with the love of poetry; but instead of permitting himself, like others, to be disenchanted by the solid realities and prosaic cares of life, he cherished the passion until he became irrecoverably a poet. Unhappy is such a choice when it can lead no higher than half-way up Parnassus! His boyish efforts were exhibited chiefly in songs and satires written in the Scottish dialect; and although, when his mind was more matured, he had the good sense to destroy them, it was only for the purpose of producing better in their season. In this way his first publication, *The Lonely Hearth*, and other *Poems*, was nearly ready for the press before he had quitted his farm.

It would be too much to follow each step of Knox's progress after he had committed himself to the uncertainties and mutations of authorship. His life was henceforth occupied not only in writing works which issued from the press, but others which were not so fortunate. It was not merely to poetry that he confined himself, in which case his stock, as a source of daily subsistence, would soon have failed; he also wrote largely in prose, and was happy when he could find a publisher. Such a course, sufficiently precarious in itself, was rendered tenfold worse by those intemperate practices that had already commenced, and which such a kind of life tends not to cure, but to aggravate. Still, amidst all his aberrations, his acknowledged talents as a genuine poet, combined with his amiable temperament and conversational powers, procured him many friends among the most distinguished literary characters of the day. We have already seen the estimate that Sir Walter Scott had formed of him: to this it may be added, that Sir Walter repeatedly supplied the necessities of the unfortunate poet, by sending him ten pounds at a time. Professor Wilson also thought highly of the poetical genius of Knox, and was ever ready to befriend him. Nor must Southey, a still more fastidious critic than either Scott or Wilson, be omitted. Writing to William Knox, who had sent him a copy of one of his poetical works, he thus expresses himself: "Your little volume has been safely delivered to me by your friend Mr. G. MacDonald, and I thank you for it. It has given me great pleasure. To paraphrase sacred poetry is the most difficult of all tasks, and it appears to me that you have been more successful in the attempt than any of your predecessors. You may probably have heard that the Bishop of Calcutta (before he was appointed to that see) was engaged in forming a collection of hymns and sacred pieces, with the hope of having them introduced into our English churches. Some of yours are so well adapted to that object that I will send out a copy of your book to him."

The principal works of Knox, besides the *Lonely Hearth*, which we have already mentioned, were a Christmas tale, entitled *Mariamne or the Widow's Daughter*, *A Visit to Dublin*, *Songs of Israel*, and the *Harp of Zion*. Much of his authorship, however, was scattered over the periodicals of the day, and especially the *Literary Gazette*. As a prose writer his works are of little account, and have utterly dis-

appeared; but the same cannot be said of his poetry, which possesses a richness and originality that places it on a higher intellectual scale, and insures it a more lasting popularity. It is pleasing also to record, that it is not only undefaced by a single line which a dying author would wish to blot, but elevated throughout into the highest tone of pure devotional feeling and religious instruction. In these cases, Sir Walter Scott seems to think that poor Knox was assuming a part—that he was speaking “according to the trick,” and nothing more. We would fain charitably believe, however, that the pensiveness of the erring bard was something else than affectation, and his religious feeling than hypocrisy. Had he not cause to write sadly when he yielded to his better feelings, and sat down to give vent to them in the language which he had learned in happier and purer days? Or was he singular under that

—“*video meliora proboque,
Deteriora sequor*” —

which converts so many an unfortunate genius into a sign-post between time and eternity, where he can do nothing more than direct others upon their heavenward journey? In the following stanzas, by which his *Songs of Zion* are prefaced, we can both recognize and understand his sincerity, notwithstanding all those unhappy inconsistencies with which it was contradicted:—

“Harp of Zion! pure and holy!
Pride of Judah’s eastern land!
May a child of guilt and folly
Strike thee with a feeble hand?
May I to my bosom take thee,
Trembling from the prophet’s touch,
And, with throbbing heart, awake thee
To the songs I love so much?”

“I have loved thy thrilling numbers
Since the dawn of childhood’s day,
When a mother sooth’d my slumbers
With the cadence of thy lay—
Since a little blooming sister
Clung with transport round my knee,
And my glowing spirit blessed her
With a blessing caught from thee.

“Mother—sister—both are sleeping
Where no heaving hearts breathe,
While the eve of age is creeping
Round the widowed spouse and sire.
He and his, amid their sorrow,
Find enjoyment in thy strain—
Harp of Zion! let me borrow
Comfort from thy chords again.”

It is only necessary to add, that this life of literary adventure to which William Knox committed himself, and in which he unwisely squandered his resources of health and strength, was a brief one, for he died at Edinburgh on the 12th of November, 1825, in his thirty-sixth year. The cause of his death was a stroke of paralysis, which he survived only three or four days.

L.

LAING, ALEXANDER GORDON, whose name is so mournfully connected with the history of African discovery, was born in Edinburgh on the 27th of December, 1793. His father, William Laing, A.M., was the first who opened an academy for classical education in the new town of the Scottish capital; where he laboured for thirty-two years, and was one of the most popular teachers of his day. His maternal grandfather, William Gordon, was also a teacher of very considerable note, and is known as the author of a system of geography, a treatise on arithmetic, a translation of the first six books of *Livy*, &c.

With such a parentage it might naturally have been supposed that the subject of this memoir was more likely to have spent his days amid the quiet pursuits of literature than in the bustle of the camp and amid the din of arms: the aspect of his early years seemed to favour the supposition. Under the tuition of his father young Laing received the elementary education that was necessary to prepare him for the university, and he was enrolled in the humanity class at the early age of thirteen years. Previous to this he had acquired a very considerable knowledge of the Latin language, of which he was passionately fond; and the appearances he made in the class then taught by Professor Christison were of so marked a kind as to secure him the very flattering notice of his preceptor; he was held up as a model for the imitation of his fellow-students, and there were but few who could entertain any hope of excelling him.

At the age of fifteen Mr. Laing entered on the business of active life, having engaged himself as assistant to Mr. Bruce, a teacher in Newcastle. Here he remained only six months, when he returned to Edinburgh and entered into company with his father, taking charge of the commercial department of the academy, for which his beautiful penmanship and other acquirements singularly qualified him.

But the time was fast approaching when the subject of our memoir was to exchange the *ferula* for the *sword*. In 1809 volunteering was very general in Edinburgh, and young Laing attached himself to a corps then forming. In 1810 he was made an ensign in the Prince of Wales’ volunteers, and from that period the academy had no more charms for him. In his eighteenth year he abandoned the irksome duties of teaching, and set off for Barbadoes to his maternal uncle, Colonel (afterwards Lieutenant-general) Gordon, through whose kind offices he looked forward to an introduction into the army. At that time Colonel Gordon held the office of deputy quartermaster-general in Barbadoes, and on his nephew’s arrival he gave him a situation as clerk in his counting-house. In this situation Mr. Laing repeatedly came in contact with Sir George Beckwith, then at the head of the command of the military on the station, who was so much pleased with the young clerk, and took so deep an interest in his fortunes, as to secure for him unsolicited an ensign’s commission in the York light infantry.

But we must hurry over the first years of Laing’s service in the army, to detail the more important passages in his history. Having obtained the ensigncy in the York light infantry, he immediately joined his regiment in Antigua; in two years he was made a lieutenant, and shortly after, on the reduction of the regiment, he was put on half-pay. Dissatisfied with the inactivity consequent on such a measure, as soon as the necessary arrangements could be made, he exchanged into the 2d West India regiment, and proceeded to Jamaica. Here over-exertion in consequence of his discharging the duties of quartermaster-general caused him to suffer much from disease of the liver. He retired to Honduras for the recovery of his health, where Colonel Arthur,

appreciating his excellence as an officer, detained him with another division of the regiment, and appointed him fort-major. His distemper, however, which at first seemed to yield in Honduras, returned with increasing violence, and compelled him to seek relief in the air of his native land, and the sympathies of his relations.

During the eighteen months he remained at home, the division of the 2d West India regiment to which he belonged was reduced, and he was again put on half-pay. Restored, however, to health, he could not remain inactive. Towards the end of 1819 he went to London, was sent for by the colonel of his regiment Sir Henry Torrence, received many flattering compliments for his former services, and having been appointed lieutenant and adjutant, he proceeded to Sierra Leone.

From the beginning of the year 1822 his history as an *African traveller* may properly be dated. In January of that year he was despatched by Sir Charles McCarthy, governor of Sierra Leone, on an important embassy to Kambia and the Mandingo country, where he collected much valuable information regarding the political condition of these districts, their dispositions as to commerce, and their sentiments as to slavery. Having so far achieved the object for which he set out, he crossed to Malacour, a Mandingo town situated on the banks of the river Malageea. There he learned that Sannasse, the chief of the district of Malagea, and a friend of the British government, had been captured by Amara, the king of the Soolimas, and was about to be put to death. Well knowing the unrelenting disposition of Amara, Laing, although labouring under a severe attack of fever and ague, resolved to go to the Soolima camp and intercede for the life of the unfortunate Sannasse.

With this view he crossed the Malageea near its source, and after experiencing many difficulties in meeting with Soolima guards, he at length reached the camp. Having witnessed the feats of warlike exercise, the dancing, and the music exhibited by Soolimas, Bennas, Sangaras, and Tambaccas, he was invited to a *palaver* with Yarradee, the general of the Soolima army. This officer received him with much kindness and with many protestations of friendship. Subsequently he was introduced to and had a conversation with Amara himself, and having obtained an assurance that Sannasse would not be put to death, he retired to Sierra Leone, where he arrived on the sixth day, exhausted by the fatigues of his journey and continued illness.

Scarcely had Laing recovered, when a report at Sierra Leone that his mission had been of no avail, induced the governor to send him on another embassy for the same object. Having once more visited the Soolima camp, he was assured indeed that Sannasse had been set at liberty, but he also learned that his town had been burned, and his property plundered or destroyed. Of this conduct he expressed in the name of his government the most decided reprobation; and after a journey of six and a half days, during which he had never for a single hour been under shelter, he once more reached Sierra Leone.

It was now that Lieutenant Laing assumed the character of a *volunteer traveller*. Having been led to believe during the last embassy that the Soolimas were in possession of considerable quantities of gold and ivory, he suggested to the governor the propriety and probable advantages of opening up a commercial intercourse with them; and the suggestion having been approved of by the council at large, he left Sierra Leone again on the 16th of April, 1822,

with the view of furthering such an object, accompanied by two soldiers of the 2d West India regiment, a native of Foutah Jallow, eleven carriers, natives of the Jolof district, and a boy a native of Sego. When he set out upon this journey little was known of the Soolimas except the name; they were said to be distant from Sierra Leone 400 miles to the eastward: it afterwards appeared that Falaba, the capital, is only distant 200 miles. They were represented as a powerful nation, rich in gold and ivory; but this also turned out not to be the fact. On his arrival at Toma in the country of the Timmanees our traveller found that no white man had ever been there before him, although the town is situated only sixty miles from Sierra Leone. His appearance, as was to be expected, excited no little astonishment—one woman in particular stood fixed like a statue gazing on the party as they entered the town, and did not stir a muscle till the whole had passed, when she gave a loud halloo of astonishment, and then covered her mouth with both her hands. Of the Timmanees he writes in his journal very unfavourably; he found them depraved, indolent, avaricious, and so deeply sunk in the debasement of the slave traffic, that the very mothers among them raised a clamour against him for refusing to buy their children. He further accuses them of dishonesty and gross indecency, and altogether wonders that a country so near Sierra Leone should have gained so little by its proximity to a British settlement.

From the country of the Timmanees Lieutenant Laing proceeded into that of Kooranko, the first view of which was much more promising—he found the first town into which he entered neat and clean, and the inhabitants bearing all the marks of active industry. It was about sunset when he approached it, and we give in his own language a description of the scene. “Some of the people,” says he, “had been engaged in preparing the fields for the crops, others were penning up a few cattle, whose sleek sides denoted the richness of their pastures; the last clink of the blacksmith’s hammer was sounding, the weaver was measuring the cloth he had woven during the day, and the guarange, a worker in leather, was tying up his neatly-stained pouches, shoes, and knife-sheaths; while the crier at the mosques, with the melancholy call of ‘Allah Akbar,’ summoned the decorous Moslems to their evening devotions.” Such were our traveller’s first impressions of the Koorankoes; but their subsequent conduct did not confirm the good opinion he had formed of them.

On approaching the hilly country, Lieutenant Laing informs us that nothing could be more beautiful or animating than the scene presented to his view—well-clothed rising grounds, cultivated valleys, and meadows smiling with verdure; the people in the different towns were contented and good-humoured, and in general received the stranger with very great kindness. In illustration of this he has given us the burden of the song of one of their minstrels:—“The white man lived on the waters and ate nothing but fish, which made him so thin; but the black men will give him cows and sheep to eat, and milk to drink, and then he will grow fat.” At Komato, the last town of the Koorankoes on his route, our traveller found a messenger from the King of Soolimana, with horses and carriages to convey him to Falaba, the capital of that nation. Crossing the Rokelle river, about a hundred yards broad, by ropes of twigs suspended from the branches of two immense trees (a suspension bridge called by the natives *nyankata*), he proceeded to that city; and, having been joined by the king’s son at the last town upon this side of

it, he entered Falaba under a salute of musketry from 2000 men, who were drawn up in the centre of the town to receive him. Not long after reaching Falaba, Lieutenant (now Captain) Laing (for about this time he was promoted), was seized with a fever, which brought on delirium for several days. While in this state he was cupped by one of the Soolima doctors, and that so effectually as to satisfy him that it was the means of saving his life. The operation differed in no respect from ours, except that the skin was scarified by a razor, and the cup was a small calabash gourd.

Our traveller enters in his journal into a long detail of the habits and manners of the Soolimas, with which he had made himself fully acquainted during his three months' residence in Falaba. To give even a short abstract of this would be inconsistent with our limits. Suffice it to say that the main object of his mission failed. The king all along promised to send back with him a company of traders; but when the time of departure arrived, these promises ended in nought. Although within three days' journey of the source of the Niger, he was not permitted to visit that often-sought spot, and deep was the grief which the loss of such an opportunity cost him; by measuring, however, the height of the source of the Rokelle, which he found to be 1441 feet, and by taking into account the height of the mountains in the distance, which gave rise to the Niger, he calculated (as he himself thought), with a tolerable degree of accuracy, that that river, which has had so much importance assigned to it, has an elevation at its source of from 1500 to 1600 feet above the level of the Atlantic. We cannot resist quoting here the testimony of an eminent writer in the *Edinburgh Journal of Natural and Geographical Science* (June, 1830), more especially as the measurements of Captain Laing have been rather lightly spoken of in the *Quarterly Review* (we believe by Mr. Barrow): "Major Laing," says the *Edinburgh Journalist*, "assigned the position and the elevation above the sea of Mount Loma, from whence the Niger takes its origin; and he first traced on the map the first part of its course towards the north for an extent of about twenty-five leagues."

On the 17th of September our traveller quitted Falaba, accompanied by numbers of the natives, who escorted him to a considerable distance; the last to leave him was the king himself. Of his "adieu" the captain speaks in the most affecting terms. On returning the route of the party was nearly the same as that by which they set out.

Before our traveller's return hostilities had commenced between the British government and the king of the Ashantees—the consequence was, that no sooner had he tasted the comforts of a British settlement, than he was ordered to join his regiment on the Gold Coast without delay. Having transmitted details to his friend Captain Sabine in London, of the geographical determinations of the latitude, longitude, and elevation of the places he had lately visited, he hastened to the Gold Coast, where he was employed in the organization and command of a very considerable native force, designed to be auxiliary to a small British detachment which was then expected from Britain. During the greater part of the year 1823 this native force was stationed on the frontier of the Fantee and Ashantee countries, and was frequently engaged, and always successfully, with detachments of the Ashantee army. On one of these occasions the enemy was completely beaten, and the fame of the victory spread over the whole coasts, and so effectually, that Sir Charles M'Carthy received the allegiance of most of the

Fantee tribes. On another occasion Captain Laing made two gallant and successful attacks on a larger division of the enemy; and entering into the territories of the King of Ajumacoo, who was suspected to be friendly to the Ashantees, he compelled that prince to place his troops under the British command.

On the fall of Sir Charles M'Carthy, which took place in 1824, Lieutenant-colonel Chisholm, on whom the command of the Gold Coast devolved, sent the subject of our memoir to England, to acquaint government more fully than could otherwise be done of the state of the country, and the circumstances of the war. He arrived in England in August, and immediately afterwards obtained a leave of absence to visit Scotland for the recovery of his health, which had been seriously affected by so many months of constant and extreme exposure in Africa. In Scotland, however, he did not continue long. In October he returned to London, and an opportunity having unexpectedly presented itself of proceeding under Lord Bathurst's auspices in the discovery of the course and termination of the Niger, he gladly embraced it. It being arranged that he should accompany the caravan from Tripoli to Timbuctoo in the ensuing summer, it became necessary that he should depart early in the year from that fatherland, which, alas! he was destined never to revisit.

Our traveller, now promoted to a majority, left London for Tripoli in the month of February, 1825. While in the latter city he had occasion to have frequent intercourse with the British consul, Mr. Warrington; a close intimacy was formed between them, and the bond was strengthened by the major's marrying Emma Maria, the daughter of the consul. This event was celebrated on the 14th of July, 1825; and two days after the marriage the major proceeded on his pilgrimage to Timbuctoo. He left Tripoli in company with the sheik Babani, whom he afterwards discovered to be no less a personage than the governor of Ghadamis. The sheik engaged to conduct him to Timbuctoo in ten weeks; the wife and the family of Babani resided there. The travellers proceeded with their *koffila* by the route of Beneoled, the passage by the Gharan Mountains being rendered unsafe in consequence of the turbulence of a rebellious chief in that district. On the 21st of August the party reached Shaté, and on the 13th of September, after a tedious and circuitous journey of nearly 1000 miles, they arrived at Ghadamis. Already had the major experienced much to vex and annoy him; his barometer had been broken; his hygrometers had been rendered useless by evaporation; the tubes of most of his thermometers had been snapped by the warping of the ivory; his glasses had been dimmed by the friction of the sand; his chronometer had stopped (in all likelihood from the insinuation of sandy particles); and in addition to this lengthened list of mishaps, his rifle-stock had been broken by the tread of an elephant.

Our traveller left Ghadamis, where he was treated with the utmost kindness and hospitality, on the 27th of October; and on the 3d of December he arrived at Ensala, a town on the eastern frontier of the province of Tuat, belonging to the Tuareg, and said to be thirty-five days' journey from Timbuctoo. Here as in Ghadamis he experienced the kindest reception, and he did all he could to repay it by administering of his medicines to the diseased.

He quitted Ensala on the 10th of January 1826 and on the 26th of the same month entered on the cheerless, flat, and sandy desert of Tenezaroff. Hitherto neither his enthusiasm nor his health had failed him; the people had all been friendly and kind to him, the elements only had been his foes; but in

the desert he was to enter on a different course of experience, and bitter assuredly it was. The Tuarics attacked, and plundered, and most cruelly mangled him. The following letter, written by himself and addressed to his father-in-law, discloses the amount of authentic information concerning this barbarous outrage:—

“*Blad Sidi Mahomed, May 10th, 1826.*

“My dear Consul,—I drop you a line only by an uncertain conveyance, to acquaint you that I am recovering from my severe wounds far beyond any calculation that the most sanguine expectation could have formed; and that to-morrow, please God, I leave this place for Timbuctoo, which I hope to reach on the 18th. I have suffered much, but the detail must be reserved till another period, when I shall ‘a tale unfold’ of treachery and woe that will surprise you. Some imputation is attachable to the old sheik (Babani); but as he is now no more, I shall not accuse him; he died very suddenly about a month since.

“When I write from Timbuctoo I shall detail precisely how I was betrayed, and nearly murdered in my sleep. In the meantime, I shall acquaint you with the number and nature of my wounds, in all amounting to twenty-four; eighteen of which are exceedingly severe. I have five sabre cuts on the crown of the head, and three on the left temple; all fractures, from which much bone has come away. One on my left cheek, which fractured the jaw-bone, and has divided the ear, forming a very unsightly wound. One over the right temple, and a dreadful gash on the back of the neck, which slightly scratched the *windpipe*,¹ &c. I am nevertheless, as already I have said, doing well, and hope yet to return to England with much important geographical information. The map indeed requires much correction, and, please God, I shall yet do much in addition to what I have already done towards putting it right.”

It would appear from this letter, that the major intended on the day after he wrote it to set out for Timbuctoo. The intention, however, was frustrated. The illness and subsequent death of Sidi Mahomed Mooktar, the marabout and sheik of the place, together with a severe attack of fever in his own person, detained him for two months longer. By this distemper he lost also his favourite servant *Jack*, to whom he was much attached. We can easily enter into his feelings when, writing again on the 1st of July to his father-in-law, he concludes the epistle by saying, “I am now the only surviving member of the mission.”

On the 18th of August he arrived at Timbuctoo, and from the following letter, which he left behind him there, which was afterwards forwarded to Tripoli by the nephew of Babani, and is the last that any of his relations ever received from him, we learn only enough to deepen our regret that he should have perished in the hour of success, and that his valuable papers should have been lost to the world.

“*Timbuctoo, 2 September 21, 1826.*

“My dear Consul,—A very short epistle must serve to apprise you, as well as my dearest Emma, of my arrival at and departure from the great capital of Central Africa; the former of which events took place on the 18th ultimo, the latter, please God, will take place at an early hour to-morrow morning. I have abandoned all thoughts of retracing my steps to Tripoli, and came here with an intention of proceeding to Jenne by water; but this intention has

been entirely upset, and my situation in Timbuctoo rendered exceedingly unsafe, by the unfriendly dispositions of the Foulahs of Massina, who have this year upset the dominion of the Tuaric, and made themselves patrons of Timbuctoo, and whose sultan, Bello, has expressed his hostility to me in no unequivocal terms, in a letter which Al Saidi Boubokar, the sheik of this town, received from him a few days after my arrival. He has now got intelligence of my arrival in Timbuctoo, and as a party of Foulahs are hourly expected, Al Saidi Boubokar, who is an excellent good man, and who trembles for my safety, has strongly urged my immediate departure. And I am sorry to say, that the notice has been so short, and I have so much to do previous to going away, that this is the only communication I shall for the present be able to make. My destination is Sego, whither I hope to arrive in fifteen days; but I regret to say that the road is a vile one, and my perils are not yet at an end; but my trust is God, who has hitherto borne me up amidst the severest trials, and protected me amidst the numerous dangers to which I have been exposed.

“I have no time to give you any account of Timbuctoo, but shall briefly state, that in every respect, except in size (which does not exceed four miles in circumference), it has completely met my expectations. Kabra is only five miles distant, and is a neat town situated on the margin of the river. I have been busily employed during my stay, searching the records in the town, which are abundant, and in acquiring information of every kind; nor is it with any common degree of satisfaction that I say my perseverance has been amply rewarded. I am now convinced that my hypothesis concerning the termination of the Niger is correct.

“May God bless you all! I shall write you fully from Sego, as also my Lord Bathurst, and I rather apprehend that both letters will reach you at one time, as none of the Ghadamis merchants leave Timbuctoo for two months to come. Again may God bless you all! My dear Emma must excuse my writing. I have begun a hundred letters to her, but have been unable to get through one. She is ever uppermost in my thoughts, and I look forward with delight to the hour of our meeting, which, please God, is now at no great distance.”

The following abstract of the testimony of Bungola, the major's servant, when examined by the British consul, gives the catastrophe of this melancholy story:

When asked if he had been with the major at Mooktar's, he answered, Yes.

Did you accompany him from thence to Timbuctoo? Yes.

How was he received at Timbuctoo? Well.

How long did he remain at Timbuctoo? About two months.

Did you leave Timbuctoo with Major Laing? Yes.

Who went with you? A kofle of Arabs.

In what direction did you go? The sun was on my right cheek.

Did you know where you were going? To Sansanding.

Did you see any water, and were you molested? We saw no water, nor were we molested till the third day, when the Arabs of the country attacked and killed my master.

Was any one killed beside your master? I was wounded, but cannot say if any were killed.

Were you sleeping near your master? Yes.

How many wounds had your master? I cannot say, they were all with swords, and in the morning I saw the head had been cut off.

¹ It should be the *spine*.

² In this letter the major always spells the name of the capital *Timbucti*.

Did the person who had charge of your master commit the murder? Sheik Bouraboushi, who accompanied the reis, killed him.

What did the sheik then do? He went on to his country; an Arab took me back to Timbuctoo.

What property had your master when he was killed? Two camels; one carried the provision, the other carried my master and his bags.

Where were your master's papers? In his bag.

Were the papers brought back to Timbuctoo? I don't know.

Thus perished, a few days after the 21st of September, 1826, by the hand of an assassin, one of the most determined, enthusiastic, and thoroughly accomplished of those daring spirits who have perilled their lives in the cause of African discovery. The resolution of the unfortunate Laing was of no ordinary kind; his mother has told the writer of this article, that years before he entered on his last and fatal expedition, in providing against hardships and contingencies, he had accustomed himself to sleep on the hard floor, and to write with the left hand; yea more, with the pen between the first and second toes of the right foot. It is melancholy to think that he should have perished unrequited by that fame for which he sacrificed so much, and undelivered of that tale of the capital of Central Africa, which he had qualified himself so well to tell. In any circumstances the death of such a man had been lamentable; but it seems the more so, inasmuch as the result of his successful enterprise is likely for ever to be unavailing for the benefit of the living. Many years have elapsed since his melancholy murder, and there seems not the shadow of a hope that his papers will ever be recovered.

But we cannot conclude this memoir without adding a few sentences regarding these important documents. Facts which were established at Tripoli during the year 1829, and established to the entire satisfaction of the consuls of Britain, the Netherlands, Denmark, Sweden, and Sardinia, develop a system of treachery and plunder regarding the major and his property, which almost amounts to the incredible. It seems to have been fully made out that the very guide (Babani) who set out with the traveller from Tripoli, was under the secret direction of Hassunah D' Ghies, son of the prime minister of the Tripolitan bashaw, and the conspirator against the major's life—that by his (D' Ghies') instructions the ferocious Bourabouschi, the eventual murderer, was appointed to be the conductor of the major from Timbuctoo, and that into his (D' Ghies') hands the major's papers (fourteen inches long by seven thick) were put by another of his emissaries shortly after the murder. In short, it was afterwards fully ascertained that this packet was secreted in Tripoli in the month of July or August, 1828.

The most amazing part of the tale of treachery yet remains to be told. It would further appear that the documents referred to were given by D' Ghies to the French consul at Tripoli, the Baron de Rosseau, and that during the greater part of the major's journey this official from France had been in secret correspondence with the conspirators—that he exerted himself in securing the flight of Hassunah D' Ghies after the treachery had been discovered, and gave protection to and tampered with his brother Mohamed, who made the disclosure.

It were out of place, in this memoir, to detail the strong chain of evidence by which these allegations are supported. A masterly summary of it will be found in the *Quarterly Review*, No. 84. Suffice it to say, that neither M. Rosseau nor the French

government did anything to acquit themselves of the fearful charge there preferred against them. Till removed, it must stand a foul blot upon their national honour.

LAING, MALCOLM, a lawyer and distinguished constitutional historian, was born in the year 1762, at Strynzia, his paternal estate, situated on the mainland of Orkney. He received the rudiments of his education at the respectable grammar-school of Kirkwall; a seminary which is generally attended by about a hundred boys, the sons of the neighbouring proprietors and farmers. When he had reached the proper age, he was sent to the university of Edinburgh, then superintended and attended by men of great talent. Along with many of the latter class, he joined in the establishment of the Speculative Society, an institution whose subjects of discussion were perhaps to a certain extent guided by his peculiar tastes, and certainly coincided remarkably with those in which he afterwards distinguished himself.

In 1785 he passed as a Scottish advocate: we do not know whether he had any predilection for the practice of the law, or whether he made choice of the profession for the mere respectability of the title, and the opportunity it might afford of attracting notice as a politician; but assuredly, notwithstanding his very high talents in general, and his peculiarly great powers as a reasoner or special pleader, he never was much employed, or known as a distinguished practising barrister. It will scarcely account sufficiently for this circumstance, that the manner in which he delivered his powerful arguments was neither majestic nor pleasing, that "his speeches were uttered with an almost preternatural rapidity, and in harsh and disagreeable tones." If he could speak and compose with facility—and in parliament he was considered an able speaker—such arguments as he might have used did not require the extraneous assistance of *manner*, even for a jury; while almost the whole pleading in Scotland at that period was addressed to the judges, from whose well-practised intellects reason and powerful argument only could find attention. Laing has shown in his writings a minute knowledge of all branches of Scottish law; he voluntarily acted the part of a lawyer in historical subjects, in a manner which has called forth the highest praise to his merely forensic abilities; and it may, on the whole, be safely concluded, that the limited extent of his practice at the bar must be attributed more to his choice than to his want of talent. The first fruit of Mr. Laing's laborious constitutional investigations was the preparing for the press the last volume of Dr. Henry's *History of Great Britain*, in 1793, after that author's death. The matter collected by Henry did not extend to a period at which the work could be closed, and Laing was requested by his executors to write two terminating chapters, to which he annexed a dissertation on the alleged crimes of Richard III. The labours of the two authors could not be very aptly united, and many consider Laing as a fierce liberalist, whose doctrines appeared harsh and prejudiced when compared to the calm narrative of Henry. The authors were indeed extremely dissimilar, but we must pause before we decide in favour of the former. Henry was a man of tame mind and tolerable good sense; but if he appeared calm and moderate in his historical opinions, he was so in the very safe and reputable cause of despotism, in which he encosured himself as an impregnable fortress, which it did not require much skill to defend. Laing, on the other hand, was a man of strong judgment and profound specula-

tion; and if he was violently argumentative in support of the opinions he had adopted, he was so not as a man who is determined to maintain a given point because he has chosen it, and is personally interested in its being shown to be true; but as one who had considered the matter accurately, had submitted it to the arbitration of his strong judgment, and was resolved to crush those prejudices which prevented others from seeing it as it appeared to himself. It is the height of all prejudice to blame a historian for his opinions; but many have deserved to be censured severely for twisting facts to support opinions, instead of bending opinions to accommodate them to facts. It was the object of Laing to discover the truth. Perhaps prepossession in favour of the line of principles he had adopted may have therefore prompted him to derive improper deductions from the facts which he produced; but his strongest political opponents have never accused him of perverting facts. Laing is said likewise to have composed the memoir of Henry which accompanied the history; but it certainly does not display his usual energy of style. Whatever defects some may have discovered in the continuation of Henry's *History*, the critical world in general saw its merit, and bestowed the countenance of its approbation. The author, thus encouraged to new historical labours, looked towards his native country, and in 1800 he published "*The History of Scotland, from the Union of the Crowns on the Accession of King James VI. to the Throne of England, to the Union of the Kingdoms in the Reign of Queen Anne.*" With Two Dissertations, Historical and Critical, on the Gowry Conspiracy, and on the supposed Authenticity of Ossian's Poems." As in the previous case, his book was very dissimilar to that of the person of whose labours his were a continuation—Dr. Robertson. Of the flowing academical ease of that author it is very destitute. It cannot be called either inelegant or harsh, but it is complicated; and by being laboured to contain much meaning, is occasionally obscure. There is much in the profundity of the remarks and reflections which Dr. Robertson could not have reached; but the chief merit lies in the display of critical power on matters of evidence, in which he displays all the acumen of the practised lawyer and the close observer of human nature. From this peculiar merit the separate dissertations, containing nothing but special pleadings, are the most useful and admirable parts of the book. In all parts of the work the author's ruling spirit has prompted him to search for debated facts, few of which he has left without some sort of settlement. He has treated in this manner many points of English history, among which is the celebrated question of the author of *Eikon Basilike*, concerning which he has fully proved, that whatever share Charles may have had in the suggestion or partial composition, Gauden was the person who prepared the work for the press. Mr. Laing appears to have enjoyed a peculiar pleasure in putting local and personal prejudices at defiance; and exulting in the exercise of strong reasoning powers, he has not hesitated to attack all that is peculiarly sacred to the feelings of his countrymen; a characteristic strikingly displayed in his dissertation on the poems of Ossian, the authenticity of which he attacked with great learning and inveterate rancour.

The author of such an attack on one of the fortresses of the national pride of Scotland did not perpetrate his work without suitable reprobation; the Highlanders were "loud in their wail," and the public prints swarmed with ebullitions of their wrath. Mr. Laing was looked on as a man who had set

all feelings of patriotism at defiance: to many it seemed an anomaly in human nature, that a Scotsman should thus voluntarily undermine the great boast of his country; and unable otherwise to account for such an act, they sought to discover in the author motives similar to those which made the subject sacred to themselves. His dissertations on the poems of Ossian had the merit of causing to be produced "The Report of the Committee of the Highland Society appointed to Inquire into the Nature and Authenticity of the Poems of Ossian," conducted under the superintendence of Henry Mackenzie, published in 1805.

At the same period Mr. Laing brought the controversy to a final issue by publishing a work which, with a sneer in its designation, he entitled "*The Poems of Ossian, &c.*," containing the Poetical Works of James Macpherson, Esq., in Prose and Rhyme, with Notes and Illustrations." The nature of the "notes and illustrations" may easily be presumed; the work indeed is a curiosity in literature. The edition of Ossian is a very splendid one; and, like an animal decked for sacrifice, the relentless editor introduced it conspicuously to the world, with the apparent purpose of making its demolition the more signal. Within the same year Mr. Laing's line of argument was answered by Mr. M'Donald, and two years afterwards a long and elaborate work, complacently termed a *Confutation*, was produced by the Rev. Mr. Graham, who, however, made a somewhat unlucky development of his qualifications for this task by quoting the *De Moribus Germanorum* of Tacitus, referring entirely to the Teutonic nations as authority concerning the Celts. Mr. Laing never confused his arguments, having never made the attempt.

In the meantime Mr. Laing's controversial disposition had prompted him to discover another subject, in the treatment of which he excited a still greater degree of wrath. In 1804 he published an edition of his *History of Scotland*, to which he prefixed two volumes containing "A Preliminary Dissertation on the Participation of Mary Queen of Scots in the Murder of Darnley." The purpose of the treatise was, with the author's usual decision and boldness, declared in the title, and through the whole of the lengthy detail of two volumes on one historical incident, he never wavers in the slightest degree from the conclusion of guilt. Having first formed his opinion in the matter—on good grounds, it is charitably to be presumed—he lays down and arranges his documents and arguments with the precision and circumstantiality of a lawyer, and no more hints at the possibility of the innocence of the queen than the crown-lawyer at that of his victim. Few who have ever read this extraordinary work can forget the startling exactness with which the arguments are suited to the facts, and to the guiding principles of the whole narrative of the renowned event laid before the reader. "Mr. Laing's merit," says a writer in the *Edinburgh Review*, who refers to this work as to one peculiarly characteristic of his genius, "as a critical inquirer into history, an enlightened collector of materials, and a sagacious judge of evidence, has never been surpassed. If any man believes the innocence of Queen Mary, after an impartial and dispassionate perusal of Mr. Laing's examination of her case, the state of such a man's mind would be a subject worthy of much consideration by a philosophical observer of human nature. In spite of his ardent love of liberty, no man has yet presumed to charge him with the slightest sacrifice of historical integrity to his zeal. That he never perfectly attained the art of full, clear, and easy narrative, was

owing to the peculiar style of those writers who were popular in his youth, and may be mentioned as a remarkable instance of the disproportion of particular talents to general vigour of mind."¹

Laing was intimately acquainted with Charles Fox, with whom he conducted an ample correspondence, the letters of which on both sides still, we believe, exist unpublished, and would certainly form a very interesting addition to our epistolary information regarding great men. That eminent statesman frequently quoted the historical works of Mr. Laing, as containing matter which could be relied on for its authenticity; and Laing became an active and zealous supporter of the short administration of his friend, during which he represented his native county in parliament. It is said, that notwithstanding the disadvantages of his manner, he was listened to and much respected as a speaker; and he gave all the assistance which so short a period admitted to the plans of the ministry for improving the Scottish courts of law. After his brief appearance as a legislator, the state of his health prevented him from interfering in public business. Whether from excessive study and exertion, or his natural habit of body, he suffered under a nervous disorder of excessive severity, which committed frightful ravages on his constitution; and it is said that he was required to be frequently supported in an artificial position to prevent him from fainting. He retired to his estate in Orkney, and his health being to a certain extent restored by a cessation from laborious intellectual pursuits, his ever-active mind employed itself in useful exercise within his narrow sphere of exertion: he improved his own lands, introduced better methods of cultivation than had been previously practised in the district, and experimented in the breeding of merino sheep. He died in the end of the year 1818, having, notwithstanding the great celebrity of his works, been so much personally forgotten by the literary world, that it is with difficulty we have been enabled to collect matter sufficient for an outline of his life. He was married to Miss Carnegie, daughter of a gentleman in Forfarshire, and sister-in-law to Lord Gillies. His property was succeeded to by Samuel Laing, his elder brother.² Besides the works we have discussed above, it may be mentioned that he edited the *Life of James VI.*, published in 1804.

LAING, WILLIAM. This well-known dealer in rich and rare literary productions, whose shop was a Herculaneum of the treasures of past ages, was born in Edinburgh, on the 20th of July, 1764. After having received his education at the grammar high-school of the Canongate, he made choice of the trade of a printer for his future occupation, and served to it a six years' apprenticeship. This selection was an unlucky one, owing to the weakness of his eyes; and therefore, instead of following it out, he became a bookseller, for which his apprenticeship had completely qualified him. In his case, too, it was not the showy and ephemeral, yet money-making, books of modern literature that constituted his stock in trade; but the choicest British and foreign editions of the old classical authors of every language—works which only the learned could appreciate, in spite of the dust and dingy vellum with which they were covered. His shop for this species of unostentatious, slow-going, and precarious traffic, was first opened in the Canongate in 1785; afterwards he removed lower down the street to Chessel's Buildings, where he remained till 1803, at which date he removed to the South Bridge, where he permanently

established his emporium. During these changes his reputation as a collector of valuable old books continued to increase, until it was established among the learned over the whole island, so that his shop became a well-known repository for those scarce volumes which his thriving brethren in the trade did not possess, and probably had never even heard of. All this, too, was the fruit of ardent disinterested zeal and untiring diligence in his profession. From the year 1786 he had continued to issue an almost annual succession of catalogues. He knew all the scarce works of antiquity, as to the best editions in which they had been published, the places at which they were to be found in Britain or upon the Continent, and the prices at which they were to be purchased. And he was ready to communicate this valuable information to the literary inquirers who frequented his shop for intelligence that could not well be obtained elsewhere. The labour of travel was added to that of painstaking home research and inquiry, and that too at a time when Edinburgh booksellers and traffickers in general limited their journeys to the coast of Fife, or even the ranges of the Pentlands. Thus, in 1793, when the French revolution was at the wildest, he visited Paris, for the purpose of making himself acquainted with such knowledge of his vocation as his own country could not supply, and ascertaining what were the best editions of those authors that are most in request. It was no ordinary zeal that made him pursue such a task amidst the roar of the Parisian pikemen and the clank of the guillotine—more especially when every stranger there was at least "suspected of being suspected." Another similar pilgrimage he made in 1799. Learning that Christian VII., King of Denmark, had been advised to dispose of the numerous duplicates contained in the royal library at Copenhagen, and being instigated by the advice of the celebrated Niebuhr, at that time a student in the university of Edinburgh, Mr. Laing repaired to the Danish capital, and there made such arrangements upon the sale of the duplicates with the privy-councillor, Dr. Moldenhawer, as was satisfactory to both parties. When the peace of Amiens had introduced a breathing interval in the wars of the revolution, Mr. Laing repeatedly visited France and Holland, still for the purpose of extending his professional knowledge, which he readily imparted to the scholars of his own country. The immense amount of information he had thus acquired, was enhanced by his kind generous temper, and modest unassuming manners.

During the war that followed the delusive peace of Amiens, by which the whole Continent was closed against British visitors, Mr. Laing was worthily employed in raising the literary character of his native country in the department of printing. And for this, indeed, he saw that there was too much need. The distinguished brothers, the Foulis of Glasgow, had passed away, and left no successors in their room. In Edinburgh, so soon to assume the name of "Modern Athens," the case was still worse; for except Ruddiman's *Livy* and Cunningham's *Virgil*, no classical work had issued from her press worth mentioning. In 1804 he commenced the attempt by publishing the works of Thucydides in six volumes, small 8vo, under the following title, *Thucydides Græce et Latine; accedunt Indices: ex Editione Wassii et Dukeri*. In printing this work Mr. Laing was fortunate in having for the superintendent of the press the Rev. Peter Elmsley, who attained such a high European distinction in Grecian literature. In 1806 the works of Thucydides were followed by those of Herodotus, in seven volumes, small 8vo, under the title of *Herodotus Græce et Latine; accedunt Anno-*

¹ *Ed. Rev.* xliv. 37. ² *Ed. Annual Register*, 1812, p. 250.

latine scribit, nomen Index Latine: ex Editionibus Wesselingii et Reizii. For editing this work Mr. Laing had secured the valuable services of Professor Porson; but as the latter went no farther than the second book, the rest was carried on and completed under the superintendence of Professor Dunbar. The next classical author whose writings Mr. Laing published, in 1811, was Xenophon, in ten volumes, also of small 8vo, under the title of *Xenophontis quæ extant Opera Græcè et Latine: ex Editionibus Schæderi et Zeunii: accedit Index Latinus.* This important publication was admirably edited by Mr. Adam Dickinson, whose Greek scholarship was only equalled by his retiring modesty, that prevented his worth from being more widely known. Mr. Laing would have followed these with similar editions of the works of Plato and Demosthenes, but was prevented, chiefly by the difficulty of obtaining competent Greek scholars to superintend such important publications. Still, however, he had done much: the editions which he had published were standard specimens of their class, and have given an impulse to classical reprinting in Scotland which, we trust, will neither be fruitless nor yet soon abandoned.

During the latter part of his life, when Mr. Laing was in easy and comfortable circumstances, he was able to devote himself to the more general interests of merchandise, and to this purpose was one of the original founders of the Commercial Bank of Scotland, and also a director. After having nearly completed his sixty-eighth year, and attended business till within three days of his death, he died at his house, Ramsay Lodge, Laurieston, Edinburgh, on the 10th of April, 1832, leaving a widow and family. His name honourably survives in one of his sons, whose valuable labours are well known in Scottish history and antiquarianism.

LANDSBOROUGH, REV. DAVID, D.D. This pious divine, zealous naturalist, and poet, was born in the parish of Dalry, Kirkcudbrightshire, in 1782. After an early education, first at the school of his native parish, and afterwards at Dumfries Academy, he entered the university of Edinburgh, where he passed through the usual course of study prescribed by the church for the office of the ministry. While a student, he was also for some time tutor in the family of Sir William Miller, who was also a lord of session, under the title of Lord Glenlee, and whose influence was exerted in behalf of David Landsborough when he was licensed as a preacher. David was first an assistant in the old church of Ayr, and in 1811 was ordained as minister of the parish of Stevenston. Belonging to what was called the "evangelical" party in the Church of Scotland, he naturally felt a deep interest in that theological conflict of which the chief subject was the right of the people to elect their own minister; and when the severance known as the "Disruption" occurred, he was one of those self-denying country ministers who abandoned the Established church for the sake of those principles he had steadfastly advocated. On relinquishing the clerical charge of the parish of Stevenston, he became minister of a congregation at Saltcoats in connection with the Free Church of Scotland.

It was not until 1847—a late period in life for a poet's first appearance in the press—that he published "*Arran, a Poem in Six Cantos.*" This production was well received in its day, and is not without some poetical merit, but still not enough to buoy up a poem of six cantos, and save it from sinking into oblivion. Happily, however, his memory will rest on a sounder basis than his poetry. He had a still

stronger enthusiasm and better natural aptitude for the study of natural history, and the hours that were not occupied with the duties of his sacred calling were spent in the study of the plants, flowering and cryptogamic, with which the picturesque district in which he dwelt abounds. He thus became to his own particular locality what Gilbert White was to his parish of Selbourne. He also carried his researches into the marine and land shells, and the mysteries of fossil botany contained in the coal-fields. But as old age came on, his principal and favourite investigations were the algæ of Ardrossan and Arran, of which several of his discoveries are announced in Dr. Harvey's *Phycologia Britannica*. These contributions of the minister were so highly valued, that Dr. Harvey in gratitude conferred his name upon a little alga or seaweed, by calling it *Ectocarpus Landsburgii*. In like manner his friend Dr. Johnston of Berwick named a zoophyte after him, *Lepralia Landsburgii*. On a similar honour being conferred upon him by naming a shell as one of the *Landsburgii*, the Free Church minister sportively asked, "Is it possible to sail far down the stream of life in a scallop?"

Thus passed the life of the Rev. David Landsborough in retirement, but with a growing reputation, which, had he been ambitious of distinction, might well have compensated for the obscurity of his position; and his scientific friends, who were enlightened by his discoveries, were also charmed by the amenity of his gentle manners, and improved by his Christian example. His works connected with his favourite science were also highly appreciated. These, besides the various papers he communicated to Harvey's *Phycologia Britannica*, were the following: "*Lectures on the Animals, Algae, Crusts, and the Two Cumbraes, with Reference to the Natural History of these Islands.*" Edinburgh, 8vo, 1852; *Popular History of British Zoophytes and Coralline*, London, 8vo, 1852; and *Popular History of British Seaweeds*. He also contributed to the *Christian Herald* the biographies of several of his parishioners, and others distinguished for their excellence, which he afterwards collected and published in a small volume, under the title of *Ayrshire Sketches*. He was an associate of the Linnean Society, and had the title of Doctor in Divinity conferred upon him by an American college. Dr. Landsborough was cut off suddenly, and by cholera, on September 12, 1854.

LAUDER, SIR JOHN, Lord Fountainhall, an eminent lawyer and statesman, was born at Edinburgh, on the 2d of August, 1646.¹ His father was John (afterwards Sir John) Lauder, baronet, a merchant and baillie of Edinburgh, a younger branch and afterwards chief of the family of Lauder of Bass and Lauder. The subject of our memoir was his eldest son, by his second marriage, with Isabel Ellis, daughter of Alexander Ellis of Mortonhall. By this wife he had fourteen sons and two daughters; by a previous marriage he had three children, and by a third wife, of whom mention will be made hereafter, he had four sons and two daughters. Of the early education of young Lauder we know nothing, with the exception of a passing memorandum in his voluminous memorials of legal matters, which shows that he had passed some time at the university of Leyden, at that time the principal continental resort of stu-

¹ Register of baptisms in Edinburgh. For this and all the other information relative to Lord Fountainhall not to be found in printed works, we are indebted to a very courteous M.S. gentleman regarding him, made by his descendant, the late Sir Thomas Lauder, of which that gentleman kindly permitted us the use.

dents at law. "The university of St. Andrews," he says, "claims to be freed from paying excise for all drink furnished to the scholars, and that upon the general privilege competent to all universities by custom. I remember we enjoyed that privilege at Leyden after our immatriculation." Having accomplished his preparatory studies, he passed as an advocate on the 5th of June, 1668, and commenced the practical pursuit of his profession with vigour, after having previously, as his early proficiency as a lawyer shows us, prepared his mind by intense and accurate study. "From my admission as an advocate," he says, "in June, 1668, I began to mark the decisions of the Court of Session;" and it is to his uninterrupted industry in this occupation that we owe that valuable mass of precedents known by the name of *Fountainhall's Decisions*, published in two volumes folio, and latterly more fully re-edited from the original manuscripts. In a case which he reports during his earlier years at the bar, strong internal evidence—arising from the use of the first person singular, the unusual prolixity of the speech,¹ and the absence of the name of the counsel—shows himself to have acted in that capacity. This action was at the instance of the town of Stirling, against the unfreemen in Falkirk and Kilsyth, bearing date January 18th, and June 25th, 1672. Lauder's speech is a curious specimen of the mixed logical and rhetorical eloquence of the forensic pleading of the age, when the judges acted more as a deliberative assembly than as a body of lawyers bound to the letter of certain enactments; and the person who addressed them, if he could not sway their passions as those of a modern jury are affected, had a wide field of influence in their reason or prejudices. Contrasted with the restricted legal pleadings of the present day, the following commencement on the part of "the learned gentleman for the prosecution," would appear very singular: "My lord commissioner, may it please your grace, what happiness and cheerfulness the eminent and most eloquent of all the apostles, St. Paul, expresses, when he is put to plead his cause before Festus and Agrippa, because the one had long been a judge in his nation, and the other was expert in all the manners and customs of the Jews, the same gladness possesses the town of Stirling, and with them the whole royal burghs, that they are to plead in behalf of their privileges this day before your grace, the great patron and conservator of them." It is to be remarked that, in this case, Lauder is pleading for the exclusive privileges of burghs, and in favour of monopolies. He opens his speech with a sketch of the arguments of his adversary, on which, probably with a wish to caricature them, he has bestowed an amiable liberality of doctrine which Adam Smith could not have excelled, and told many politico-economical truths which few had then imagined. His own answers to the principles he thus beautifully lays down, sound harsh and jarring in comparison, although they were far more accordant to the principles of the time. "Do not," he says with considerable tact, "think it a light matter to rob the royal burghs of their privileges, which are become their property by as good a title as any of you bruike your lands and estate. By what hand ye shall communicate these liberties (now called in question) to the defenders, by that same shall ye lop off the royal burghs from being the third estate in the kingdom. Remember that a threefold cord ought not to be easily broken. Consider that lamentable confusion may follow on loos-

ing one pin of the government; that the touching such a fundamental sacred constitution may unhinge the whole; that government is like a sheaf of arrows fast bound: pull out one, all will follow and fall to the ground; and how terribly dangerous such an innovation may be." It will be held in mind, however, that each counsel was fee'd for the principles he maintained, and that the genuine opinions of both may have almost united in "a happy medium." The speech, on the whole, is full of classical learning and statistical information, and cannot fail to convey a pleasing idea of the intelligence and talent of a forensic orator of the seventeenth century.

Soon after this period we find the subject of our memoir connected with one of those constitutional acts of resistance for which the bar of Scotland has only, in a very few instances, been celebrated. It is well known to those acquainted with Scottish history, that a private litigation betwixt the Earls of Dunfermline and Callender interested the feelings or cupidity of Lauderdale, who was determined to influence the decision in favour of the former by swaying the judges through his personal appearance on the bench, in virtue of his honorary title of "an extraordinary lord of session." The affair was managed by having the cause prematurely called in court, in defiance of statute; and, a decision being come to in favour of the pursuer, Callender lodged an appeal to parliament, a novel procedure, which it was the interest of the king and of the judges to stifle at its first appearance. There are few who will not acknowledge that a final appeal of litigated cases to the legislative tribunal of the country, is, if not a preventive, at least a check to the consequences of influence or prejudice in inferior judicatories. The absence of such a principle, and the decay of jury trial in Scotland, had both originated from the same cause. Parliament was anciently the great jury of the nation, and, with the king as its president, the court of last resort in all litigations: but becoming, from the nature of the inferior courts, overburdened with judicial business, which a large body of men could not easily accomplish, the full powers of parliament, in this respect, were bestowed on a judicial committee called the lords auditors, from which, through a gradation of changes, was formed the Court of Session, which thus, by its origin, united the duties of the jury, the law court, and the legislative body of last resort. In these circumstances it was not difficult for government to discover that a measure so unpleasing to itself was a daring innovation of the "constitution." The counsel for the appellants, Lockhart and Cunningham, were desired to make oath regarding their share in this act of insubordination, and not only refusing, but maintaining the justice of appeals, were summarily prohibited the exercise of their profession. The members of the bar united to resent the insult and protect their rights, and fifty advocates (probably very nearly the whole number then at the bar), of whom Lauder was one,² followed their distinguished brethren to retirement, and at the instance of Lauderdale were banished twelve miles from Edinburgh. After a year's exile they were allowed to return, having managed to effect a compromise with the court. In another appeal, which was attempted not long after, the appellant was persuaded to trust to the effect of recalling his appeal; but the judges, on whom the mixture of intimidation and flattery appears to have

¹ Extending from p. 642 to 679 of Brown's *Supplement*, where it is styled "Fountainhall's Speech for the Pursuers."

² Mackenzie's *Memoirs*, 293, where Lauder, among others, subscribes an address by the debarred advocates to the privy-council. For a further account of the affair, see the memoirs of SIR G. LOCKHART and SIR G. MACKENZIE.

produced little effect, adhered, notwithstanding an implied promise to the contrary, to their previous interlocutor. "And so," remarks Lauder in reference to the case, "he was either ill or well served for his complimenting them. But the times were such that no rational man could expect a rectification from them of what had once, even though un-awares, escaped them. When their honour was once engaged at the stake, they blushed to confess what is incident to humanity itself, *nam humanum est errare*." With regard to his own sufferings for judicial integrity, he remarks, "I have few or no observations for the space of three sessions and a half, viz. from June, 1674, till January, 1676, in regard I was at that time debarred from any employment, with many other lawyers, on the account we were unclear to serve under the strict and servile ties which seemed to be imposed on us by the king's letter, discharging any to quarrel the lords of session their sentences of injustice, and was not restored till January, 1676." After his restoration to his powers, his collection of decisions shows that he was a well-employed and active counsellor.

His next appearance in public life is at the celebrated trial of the Earl of Argyle, in 1681, for a treasonable explanation of the test, for whom Lauder acted as counsel, along with Lockhart and six others. The vulgar prejudice against vindicating a person accused of any crime, together with the cautious vigilance of the crown, trammelled for a long time the legitimate powers of counsel in Scotland, and, especially in cases of treason, brought their duty so much under the arbitration of the court, that a practice prevailed by which it was considered illegal to defend a person accused of such a crime without the permission of government; and therefore every prudent advocate declined interfering till he could produce a royal warrant. In the present instance Argyle's counsel had prepared and signed, as lawyers, an "opinion" that his explanation of the test was a legal one. The consequence of this, as detailed in Lauder's own words, was, that "The council named a committee to call my lord Argyle's eight advocates, viz., Sir George Lockhart, Sir John Dalrymple, Messieurs Walter Pringle, David Thoirs, Patrick Home, John Stewart, James Graham, and myself, for subscribing an opinion that his explanation contained nothing treasonable in it. We were examined upon oath; and it was called a new practice to sign opinions with us, especially in criminal cases importing treason, and a bad preparative; though lawyers should not be prelimited nor overawed freely to plead in defence of their clients; the privy-council having authorized us to that purpose. Tho' some aimed at imprisoning and depriving us, yet, after we had spoke with his royal hynes, he was pleased to pass it; tho', he said, if any bad use were made of our signed opinion, by spreading it abroad in England to incense them, or reproach the duke or the judges, he could not but blame us. It was afterwards printed in England, and Argyle's trial, with another piece, called a *Scotch Mist to Wet ane Englishman to the Skin*: being sundry animadversions on Argyle's process."

Although his political proceedings do not seem to have been calculated to bring him within the atmosphere of court favour, he early received the dignity of knighthood; at what precise period is not known, but apparently previous to the year 1681. Much about the same period, or some years afterwards, he appears to have acted as one of the assessors to the city of Edinburgh; a circumstance discoverable from his remarking, that on the 4th of November, 1685, the other gentleman who held that

office was removed, from some cause connected with burgh politics, while he was retained.

In 1685 Sir John Lauder became a member of the committee of estates; and for more than twenty years,¹ until the treaty of union, he appears from the journals of the house to have performed his parliamentary duties with activity and zeal. He was returned for the shire of Haddington on the 23d of April, along with Sir John Wedderburn of Gosford. His election was disputed by Sir James Hay of Simplum; and the committee on controverted elections having reported that the votes were equally divided, a new election was proposed, when one of the voters for Sir James Hay being discovered to have given his vote after the election had been formally terminated, Sir John Lauder was declared the sitting member by a majority of one. Lauder was early discovered in his legislatorial, as he had been in his professional capacity, not to be a docile and obedient supporter of the measures of government. In the first parliament which he attended he refused to vote for the forfeiture of the Earl of Melville, who had fled from the wrath of government after the discovery of the Rye-house Plot.²

He was a zealous friend to the Protestant faith, when there were few in Scotland who risked an open defence of the religion to which they were so ardently attached. The government, who found it difficult to make the protection of Protestantism a crime, had nevertheless power enough to harass him. "On May 1st, 1686," he says, "Mr. James Young, son to Andrew Young, writer to the signet, is apprehended by Captain Graham, and kept in the court of guard, being delated as a copier and dispenser of a paper, containing reasons why the parliament should not consent to the dispensing with the penal laws against Papists, and reflecting in the end on such Protestants as had apostatized! and for having verses against the Bishop of St. Andrews and Bishop of Edinburgh; and he having in his examination named John Wilson and John Nasmyth, my servants,³ as bringers of these papers to his chamber, the chancellor signed an order to Captain Graham to arrest them, apprehending possibly to reach myself for libelling, as he termed it. But they having named their authors from whom they had them, were liberated, and their authors, viz. Mr. John Ellis, Robert Keill, &c., were cited."—"My two servants," he afterwards says, "being imprisoned, and I threatened therewith, as also that they would seize upon my papers and search if they contained anything offensive to the party then prevailing, I was necessitated to hide the manuscript, and many others, and intermit my historic remarks till the Revolution in the end of 1688, after which I began some observes of our meeting of estates of parliament held in 1690-93 and 95, and other occurrences foreign and domestick, briefly summed up, and drawn together yearly (but not with such enlargements as I have used here), and are to be found up and downe in several manuscripts besyde me, to be reviewed *cum dabit otium Deus*."

When James made his well-known recommendation to the parliament of Scotland to rescind the penal statutes against Roman Catholics, Lauder joined in the debate on the appropriate answer, in a spirit of moderation, which, according to the amount of

¹ The record shows him to have been returned of the following dates: 23d April, 1685; 29th April, 1686; 3d September, 1690; 9th May, 1695; 8th September, 1696; 21st May, 1700; 6th May, 1703; 6th July, 1704; 28th June, 1705; 3d October, 1706.—*Act. Parl.* vols. viii. ix. x.

² *Act Parl.* ix. Ap. 45.

³ The term "servant" is invariably used by Lauder and other lawyers of the period for "clerk."

his charity, the reader may attribute to prudence, or liberality, or both united. On the question, what term the parliament should bestow on those who professed the Romish faith, "I represented," says he, "that there was no man within the house more desirous to have these odious marks of division buried, and that we might all be united under the general name of Christian. It is true the names under which they were known in our law were the designations of the papistical kirk, heresy, error, superstition, popish idolatry, and maintainers of the cruel decrees of the council of Trent; and though it was not suitable to the wisdom and gravity of parliament to give them a title implying as if they were the true church, and we but a sect, yet I wished some soft appellation, with the least offence, might be fallen on, and therefore I proposed it might run thus, *those commonly called Roman Catholics*; that the most part of our divines calls us the catholics, and so Chamier begins his *Panstratia*, 'Vertuntur controversiæ, *Catholicos inter et Papistas*.' The chancellor called this a nicknaming of the king, and proposed it might run in general terms thus, *as to those subjects your majesty has recommended to us*," &c. The motion of the Archbishop of Glasgow, that they should be simply termed "Roman Catholics"—a repetition of the king's own words—was finally carried. But however he might be inclined to be conciliatory about epithets, Lauder resisted with firmness the strong attempt made by James and his commissioner, the Earl of Moray, towards the conclusion of the parliament, finally to abolish the penalties against Roman Catholics. In his manuscripts are preserved seventeen closely written pages of matter on this subject, entitled "A Discourse in defence, whereof part was spoken in the Parliament, of the Penal Laws against Popery, and why the Toleration Act should not Pass; and the rest was intended, but was prevented by the sudden rising of the Parliament." Frequent application, often in the most contemptible of causes, has made the arguments contained in this able document too hackneyed to please a modern taste; an impartial posterity, however, will reflect, that though liberal feeling has often been disgusted by a similar discussion of a question which to this day bears the same name, the supporters of the penal laws against Roman Catholics in the reign of James VII. were not striking against freedom of opinion; that they were a party which had just halted from a battle for their own privileges and liberties, and once more beheld them sternly menaced; that they did not wish to dictate to the consciences of an oppressed body of men, but were boldly preserving the purity of their own, by using the only means in their power to prevent the resuscitation of a church which sat in judgment over the mind, and was armed with a sword to compel obedience to its dictates. "It were," says Lauder, "a strange excess and transport of Christian lenity and moderation, to abolish our laws against Papists, who, by the principles and practice of their church, may show no favour to us; but will turn the weapons we arm them with to the total subversion of our religion:" words which had a meaning when a bigoted papal monarch sat on the throne, and the horrors of a high-commission were in too fresh recollection; but which have none when used towards that body grown poor and powerless, and only desiring to enjoy their own religion in peace.

We must not omit to mention that at the trial of the Duke of Monmouth in 1686, Sir John Lauder and other two counsel were employed to protest for the interest of the duchess, who was absolute pro-

prietrix of the estate enjoyed by her husband. The criminal court would not condescend to receive a protest in a matter purely civil; but did condescend to forfeit the property of the duchess for the crime of her husband. It was afterwards, however, given back by the king.

We pause in the history of his political career to record a few domestic events which characterized the life of Sir John Lauder. He had been married on the 21st January, 1669, to Janet Ramsay, daughter of Sir Andrew Ramsay, Lord Abbotshall, whose father was the celebrated Andrew Ramsay, minister of the Grayfriars' Church. This lady, after bearing him eleven children, died in 1686. Her husband has thus affectionately noted the event, "27 Februarii, 1686, at night happened *mors charissimæ meæ conjugis mihi amarissima et luctuosissima*; so there is little to the 10th of March, I not having come abroad till then." On the margin is written *nota non obliviscenda*. In the curious familiar memorials which he has left behind him we find frequent instances of that warm domestic feeling which is often the private ornament of men illustrious for their public and political intrepidity. To any disaster in his numerous family—for he had seven children by a second wife—we sometimes meet such simple allusions as the following, buried among the legal notanda or the political events of that feverish period: "17 Decembris, 1695, I entered on the bills; and my dear child Robert dying this day, the observes are the fewer, in respect of my absence for two days, and my other affairs, which diverted my constant attention that week." Again, "21 July, 1696, Tuesday: my dear son William dying this day, I was absent till his burial was over." Sir John was a second time married, on the 26th of March, 1687, to Marion Anderson, daughter of Anderson of Balram, who survived him.

The domestic tranquillity of this excellent man was long harassed by the machinations of a step-mother—his father's third wife, of whose heteroclitie proceedings we must give a slight sketch. This woman, Margaret Ramsay, daughter to George Ramsay of Iddington, to whom Sir John Lauder's father was united in 1670, at the ripe age of eighty-six, prevailed on her husband to procure a baronet's title, which he obtained in July, 1688, and the lady, showing that she had more important designs than the gratification of female vanity, managed, by an artifice for which parental affection can scarcely form an excuse, to get the patent directed to her own son George, and the other heirs male of her body, without any reference to the children of the previous marriage.

A document among the papers of Sir John Lauder, being a draft of an indictment, or criminal libel, at the instance of the lord-advocate, before the privy-council, against the lady and her relations, gives us his own account of the transaction: it is dated 1690, and commences "Memorandum for Sir John Lauder, to raise an libell at privy counsell at the instance of Sir J. D. (Sir John Dalrymple), his majesty's advocate, for his majesty's interest, and of Sir John Lauder, Mr. William and Andrew Lauders, his brothers german, against Margaret Ramsay," &c. Neither the *Medea* of Euripides, nor the old ballad of *Lord Randal my Son*, gives a more *beau idéal* picture of the proceedings of the "cruel step-dame," than this formidable document. It accuses her of having "wearied her husband by her excessive importunity and ambition to procure and accept ane knight baronet's patent;" that, having managed through her relations to direct the destination in the manner we have mentioned, the old gentleman im-

mediately sent the patent to Mr. Robert Lauder to be altered, and Mr. Robert, certainly not having the fear of what are awfully termed consequences before his eyes, proceeded to his duty, when the enraged lady, "with several others of her accomplices, intending by force to have taken the patent from him, threatened to see his heart's blood if he did not deliver it presently." Farther, "to fright her husband to comply with her unreasonable and unjust demands, she threatened that she would starve herself if that patent was not taken to her son, and that she would kill herself if she saw any of the complainers come near the house, and if he did not absolutely discharge them his presence;" and still more emphatically, "she tore the clothes off her body, and the hoods off her head, and sware fearful oaths, that she would drown herself and her children, and frequently cursed the complainers, and defamed and traduced them in all places, and threatened that she hoped to see them all rooted out, they and their posterity, off the face of the earth, and her children would succeed to all."¹ A decree appears to have been obtained against the defenders in the privy-council; and the patent being reduced in the civil court, a new destination was obtained, by which Sir John Lauder succeeded to the family title and estates on the death of his father in 1692.

Meantime, the Revolution had brought him a relief from the dangers and difficulties of opposition, and the hope of preferment and influence. He was appointed a lord of session, and took his seat with the title of "Lord Fountainhall," on the 1st November, 1689. On the 27th of January following he was also nominated a lord of justiciary. In 1692 Sir John Lauder was offered the lucrative and influential situation of lord-advocate; but the massacre of Glencoe, an act characteristic of a darker age and a bloodier people, had just taken place; the lukewarmness, if not criminality, of the government formed an impediment, and, to his honour be it mentioned, he would not accept the proffered situation except on the condition of being allowed to prosecute the murderers. At the time when the Scottish parliament found it necessary to strike a blow for the property of the nation invested in the Darien scheme, it was proposed that the parliament should vote an address to the king, calling on him to vindicate the honour of Scotland, and protect the company. The more determined spirits in that exasperated assembly demanded an act as the legitimate procedure of an independent body. Among these was Lauder. The address was carried by 108 to 84, and a body of those who voted otherwise, with Hamilton and Lauder at their head, recorded their dissent.² He began at this period to show opposition to the measures of government. Along with Hamilton he recorded a dissent from the motion of the high-commissioner, for continuing for four months the forces over and above the 3000 which constituted the regular establishment.³ He attended parliament during the tedious discussion

of the several articles of the union, and we find his protest frequently recorded, although to one or two articles, which did not involve the principle of an incorporating union, he gave his assent. In the final vote his name is recorded among the noes.

Soon after the union, on the appointment of circuits, old age interfered with Lord Fountainhall's performance of all his laborious duties, and after some unwillingness on the part of royalty to lose so honest a servant, he resigned his justiciary gown, and a short time before his death he gave up his seat in the Court of Session. This good and useful man died in September, 1722, leaving to his numerous family a considerable fortune, chiefly the fruit of his own industry. On a character which has already spoken for itself through all the actions of a long life, we need not dilate. His high authority as a rational lawyer is well known to the profession. His industry was remarkable. His manuscripts, as extant, fill ten folio and three quarto volumes; and there is reason to believe, from his references, that several were lost.

In 1822 was published "*Chronological Notes of Scottish Affairs from 1680 till 1701*," being chiefly taken from the Diary of Lord Fountainhall. Unfortunately this volume is not taken from the original manuscript, but from an abridged compilation by a Mr. Milne, a writer in Edinburgh; a fierce Jacobite, who has disturbed the tranquil observations of the judge with his own fiery additions, apparently judging that his cause might be well supported by making an honest adversary tell falsehoods in its favour. A genuine selection from the historical manuscripts of Lord Fountainhall, however, was published by the Bannatyne Club in 1840 and 1848, under the titles of *Historical Observes*, and *Historical Notices of Scottish Affairs*, by which much light is thrown upon the political events and social condition of the period.

LAUDER, SIR THOMAS DICK, Bart. This multifarious and distinguished writer was the eldest son of Sir Andrew Lauder, Bart., of Fountainhall, Haddingtonshire, and was born in 1784. The family was originally of Norman extraction, its founder, De Lavedre, having come from England with Malcolm Canmore, when the latter drove Macbeth from the Scottish throne; and from him descended a race who took part in all the subsequent wars of Scottish independence, and fought gallantly under the banners of Wallace, Bruce, and the Douglases. It was natural that these family recollections should influence the early studies of Sir Thomas, and inspire him with that love of chivalry and antiquarian research which he afterwards turned to such good account. At an early period he entered the army, and was an officer in the 79th regiment (Cameron Highlanders). Here he continued only a short period; and on quitting the army he took up his residence in Morayshire, where he married Miss Cumming, only child and heiress of George Cumming, Esq. of Relugas, a beautiful property on the banks of the Findhorn. From this time till the close of life he was fully occupied with the civil appointments he held, and with the pursuits of science and literature, in which he sustained a high reputation to the end.

The first efforts of Sir Thomas in authorship, so far as can be ascertained, were in the departments of natural science; and his diligence in these studies is well attested by his numerous contributions to the scientific journals of the day, and especially to the *Annals of Philosophy*, edited by the late Thomas Thomson, professor of chemistry in the university of Glasgow. To this magazine we find him, in 1815 and the three following years, contributing papers on

¹ Notwithstanding her ferocity, this woman seems to have managed to be regretted at her death. She is the only person to whom, from the date April 18, 1773, we can apply a piece of tragedy. "In idem patre generis omnia Domina D.A. Fountainhall, Eligium, ad usum et captum adolescentuli comitum 5000 Alesandri. Lauder, ex industria accommodatum." It thus elegantly commences:—

"An quæ matris ex genere stemmate nata
Fatorum rigido numine, sancta cadis."

Or, as it is Englished—

"Fallen by the dismal stroke of harsher fate,
Because by birth, but broke by virtue, great."

Pamphlets Ad. Lib. M. 4.4.

² *Act. Parl.* x. 269.

³ *Act. Parl.* x. 274.

the following subjects, from which the nature of his researches can best be understood:—"Account of a Toad Found in the Trunk of a Beech;" "Account of the Worm with which the Stickleback is infested;" "Account of the Aluminous Chalybeate Spring which has lately appeared on the Property of Sir Andrew Lauder Dick, Bart., at Fountainhall, in East Lothian." (To this he subsequently added a register of its diurnal alternations contrasted with the barometer, during nineteen months, a daily list of which had been made by his father, who was also a lover of natural science.) "An Account of the Earthquake in Scotland;" "Account of Different Currents of Wind observed at the same time." But the most important of his philosophical investigations, upon which he had spent much study, and made more than one exploratory journey to the wilds of Lochaber, was contained in his paper "On the Parallel Roads of Glenroy," which he read before the Royal Society of Edinburgh in 1818. These singular roads, it was generally supposed, had been constructed either by the ancient Celtic kings of Scotland when their royal abode was the castle of Inverlochy, or by the Fingalian "car-borne" chiefs who had flourished at a still earlier period. Sir Thomas, however, attempted to show, by a careful induction, that these stupendous pathways, instead of being constructed by kings, heroes, or primitive giants, had been formed by the action of the waters of a lake that had stood at different heights, corresponding with those of the shelves, until it had finally burst through its latest barrier in consequence of some great natural convulsion—probably the same that formed the great glen of Scotland through which the Caledonian Canal has been carried. This simple theory, although it sorely discomfited the lovers of the wonderful, and worshippers of "superstitious eld," was greatly admired by the sober and scientific, not only for its originality, but the powerful array of facts and arguments adduced to support it, illustrated as it farther was by eight drawings, with which Sir Thomas accompanied his dissertation. This essay, with engravings of his sketches, was published in the *Transactions of the Society*. He had thus not only the merit of throwing new light upon the theory of natural geological formations in opposition to the artificial, but of directing particular attention to these phenomena of Lochaber, which have been investigated by subsequent geologists, among whom may be mentioned Mr. Milne and Sir G. S. M'Kenzie. Another subject of scarcely less importance, that occupied the researches of Sir Thomas, was the natural transport, by means of ice, of a large boulder on the shore of the Moray Frith. His account of this huge isolated stone, and his conjectures as to the mode in which it had found its ultimate landing-place, was published in the third volume of the *Wernerian Transactions*; while his theory formed the basis on which several scientific writers afterwards endeavoured to account for still more important revolutions by means of ice, which had been effected over a large portion of the earth's surface.

The nature of these studies, extending over so many fields, and the reputation which they had already won for him, would have constituted a stock in life upon which most of our comfortable country-gentlemen would have contentedly reposed to the end. But the mind of Sir Thomas Dick Lauder possessed an amount of intellectual vigour that could not be so easily satisfied; he had only thus commenced, not concluded, his career; and after having begun with science, he turned, by way of relief, to the lighter departments of literature, through which he was to be better known to the world at large, than

by his more laborious investigations among migratory rocks and water-chiselled highways. On the commencement of *Blackwood's Magazine*, at the beginning of 1817, he became one of its earliest contributors; and his first tale which appeared in it, under the title of "Simon Ray, Gardener at Dumphail," was written with such vigour and truthfulness, that, for a time at least, it was supposed to have proceeded from no other pen than that of Sir Walter Scott himself. Some impression of this kind, indeed, seems at first to have been made by the anonymous contribution upon the conductors of the magazine also, for they appended to the tale the flattering announcement of "Written, we have no doubt, by the author of *Waverley*." The great era of magazines had now fully commenced, as well as that of steam, in which the impatient mind, no longer booked for the slow conveyance of folios and quartos, was to be carried onward with railway speed; and to the most important of these periodicals Sir Thomas became a frequent and welcome contributor. Besides these light but attractive sketches, he also became a writer in the grave methodical pages of the *Edinburgh Encyclopædia*, for which he drew up the statistical account of the province of Moray. It was in the midst of these and such other literary occupations that he succeeded to the baronetcy of Fountainhall, by the death of his father in 1820, and was the seventh who had enjoyed that title.

After having preluded for some time in the department of fiction, and as an anonymous contributor to the periodicals, Sir Thomas Dick Lauder, having now fully essayed his strength, adventured upon the decisive three-volume experiment, by publishing his historical romances of *Lochindhu* and the *Wolf of Badenoch*. The scenery of both of these works was laid in Morayshire, a county with which he was so well acquainted, while the time of action was that which succeeded the days of Bruce, the period when chivalrous warfare was at the hottest in Scotland, while it had Froissart for the chronicler of some of its best passages of arms. It was a right perilous attempt to follow the sandalled steps of the warrior monk; and Sir Thomas, stalwart though he was, and a knight to boot, was scarcely able to keep pace with his mighty leader. But who, indeed, would read modern chivalrous romances in the hope of finding newer and more stirring deeds of warlike emprise, after what Froissart has written?—or search for keener ridicule of the fooleries of chivalry than can be found in the pages of Cervantes? The attempts of Sir Thomas, therefore, in these productions, partook somewhat of the inferiority of Smollet, when the latter endeavoured, in his *Sir Launcelot Greaves*, to produce an English similitude of *Don Quixote de la Mancha*. It happened unfortunately also for *Lochindhu* and the *Wolf of Badenoch*, that their author, not content with entering a field so preoccupied, must needs accommodate himself to the language of the period, by interlacing his phraseology with antique and consequently uncouth words; and thus his style, which after all would have been a *patois* unintelligible to the fourteenth century, of which it purports to be the type, becomes utter barbarism to readers of the nineteenth, for whose gratification it was written. This is generally the fate of such literary compromises; and Sir Walter Scott was guilty of the same blunder when, in his romance of *Ivanhoe*, he jumbled together the characters and events of the early period of Richard Cœur de Lion with the refinements of that of Richard II., and crowned the whole with the English phraseology of the days of Queen Elizabeth. But, in spite of these incongruities, *Ivanhoe* is a magnificent epic, and

Lochinhu and the *Wolf* are heart-stirring captivating romances. In scenic description and delineation of events Sir Thomas has approached the nearest to Scott of all the ambitious imitators of the "Great Unknown" of the period. But it is in individuality of character that he chiefly fails, and his knights, like the brave Gyas, and the brave Cloanthes, are little more than facsimiles of each other. They have all the same complement of thews and bones, and are equally prompt to use them; and they only differ by virtue of the scenery with which they are surrounded, and the historical actions of which they form a part.

But of all the works which Sir Thomas Dick Lauder has produced, that entitled *The Moray Floods in 1829*, is perhaps the one by which he will continue to be best appreciated. He had himself not only been an eye-witness of these tremendous inundations, but an active philanthropist in the relief of those who had been ruined by the havoc; and the account which he wrote of the event will long be prized by the lovers of vigorous writings, and vivid, poetical, and truthful description. Another descriptive work which he produced, commemorative of a great national event, was the *Queen's Visit to Scotland in 1842*. But reverting during this long interval to that kind of study which gave full scope to his imagination, as well as brought the varied resources of his experience and observation into complete act and use, he published his "*Highland Rambles, with Long Tales to Shorten the Way*," a work which, independently of its attractive narratives, is an interesting memorial of the Celtic character, manners, and superstitions, and the intimate knowledge which he had acquired of them. Besides these original productions, he edited *Gilpin's Forest Scenery*, and *Sir Uvedale Price on the Picturesque*. To the latest period of his life, also, he continued to be a contributor to our periodicals, in which his articles, chiefly consisting of Highland and Lowland tales and sketches, were always gladly welcomed by the reading public. These, we doubt not, if collected and published in a separate work, would soon become the most popular of his literary productions.

From the foregoing account it might be supposed that the life of Sir Thomas had been chiefly spent in the study; and that when he emerged into society, it was rather for the purpose of enjoying relief, than taking an active part in its occupations. But, on the contrary, he was an industrious, public-spirited man, fully conscious of the duties of his position, and indefatigable in promoting the best interests of his country. In this way he bestirred himself in the great political questions of the day, and was one of the most active promoters in Scotland of the reform bill. In 1839 he was appointed secretary to the Board of Scottish Manufactures, which was soon afterwards united by the lords of the treasury to the Board of White Herring Fishery; and as secretary of both his labours were sufficiently diversified, as well as widely distinguished from each other. It was a Janus-like office, that required a double and opposite inspection—or rather, a planting of "one foot on sea and one on shore," like the very personification of an inconstant man, which Shakspeare's ditty so touchingly describes. But faithfully and ably were these opposite functions discharged. In his department of manufactures Sir Thomas quickly perceived that, in consequence of the extension of our commercial and manufacturing operations, the original purpose for which the Scottish board had been created was in a considerable degree superseded. He therefore endeavoured to restore it to full efficiency, by adapting it to the progress of modern im-

provement; and for this purpose he proposed that its surplus funds should be employed in the extension of schools for teaching pattern-drawing. On the proposal being sanctioned, he carried it into execution so zealously, that artistic taste was diffused anew throughout our manufactories of fanciful design, and a love of the fine arts promoted among those classes that had hitherto been contented with humble imitations of foreign excellence. His task as secretary of the White Herring Fishery Board was fulfilled with equal diligence; and as one of its duties was an annual voyage round the British coast, and an examination of its places of export, he turned the experience he thus acquired to good account, by aiding in the supply of materials for a narrative of the voyage in 1842, which was written by Mr. Wilson, the naturalist, who accompanied him. He also wrote several books of directions for the taking and curing of herring, cod, ling, tusk, and other fish, which were translated into Gaelic for the instruction of the Highlanders. While so much was accomplished in the course of his professional duties, he was not neglectful of those public movements which concerned the general weal, and from which he might have excused himself under the plea of a press of occupation elsewhere. Among these public-spirited exertions we can only allude in passing to the interest he took in the proceedings of the original Scott Monument Committee, of which he was one of the most active agents—and his efforts for the construction of the Queen's Drive round Arthur's Seat and Salisbury Crag, already become the fairest ornament of the fairest of European cities.

Such was the life of Sir Thomas Dick Lauder to the close—a twofold life of diligent study and active exertion, in each of which he was a benefactor to society, and a distinguished ornament of his country; while several of his writings, translated into the French and German languages, acquired for him a European reputation. His private worth and amenity of character had endeared him also to the learned and talented, so that scholars, authors, and artists sought his society, and were benefited by his counsel and conversation. Even strangers were arrested, as he passed along the streets of Edinburgh, by the sight of his noble stately form, long white locks, and remarkably handsome expressive countenance, and felt convinced at once that this man must be some one as much distinguished above his fellows by intellectual as by personal superiority. This round of activity was only interrupted by his last illness, which was occasioned by a tumour on the spine, that for fifteen months incapacitated him for attendance at the Board of Trustees for Manufactures, &c., and finally obliged him to lay aside a work descriptive of the rivers of Scotland, of which part had already appeared in a serial form in *Tail's Magazine*. He died at his residence called the Grange, near Edinburgh, on the 29th May, 1848, at the age of sixty-four.

Independently of the offices we have mentioned, Sir Thomas held that of deputy-lieutenant of the county of Haddington; he was also a fellow of the Royal Society of Edinburgh. He was survived by two sons and six daughters, and succeeded in the baronetcy by his eldest son, Captain Dick, who, a short time previously, had retired from the army after fourteen years of military service as an officer in the East India Company.

LAUDER, WILLIAM, a man renowned in literary history for having turned superior talents, and very high classical acquirements, to an attempt to defraud Milton of his fame. Of the period of his birth, which has escaped the patient investigation of Chalmers,

we are totally ignorant. The earlier part of his life was passed in great obscurity, although it has been ascertained from his own remarks—in after-life we believe—that he was connected, and not very distantly, with the respectable family of Lauder of Fountainhall. He received all his education in Edinburgh, and passed through the university with considerable credit. After leaving college he seems to have immediately resorted to teaching, as a means of gaining a livelihood; but his early career in this profession was for some time interrupted by an accident, which must have materially affected his future course of life. While standing near a party engaged in the game of golf, on Bruntfield Links, near Edinburgh, a ball struck him on the knee; the wound, which cannot have been very serious, festered from careless treatment, and he was compelled to submit to the amputation of his leg.¹ In 1734 he was employed by Professor Watt, then in bad health, to teach for him the class of humanity or Latin; and on the death of that gentleman he naturally exerted himself to procure an appointment as successor; but though he had talents to teach, he had not sufficient influence to be appointed a professor. We are, however, informed that on this occasion the professors gratuitously honoured him with “a testimonial from the heads of the university, certifying that he was a fit person to teach humanity in any school or college whatever.”² After this disappointment his ambition sunk to an application for the subordinate situation of keeper to the university library, but this also was denied him. He appears indeed to have been a person whose disposition and character produced a general dislike, which was only to a small extent balanced by his talent and high scholarship. “He was,” says Chalmers, with characteristic magniloquence, “a person about five feet seven inches high, who had a sallow complexion, large rolling fiery eyes, a stentorian voice, and a sanguine temper;” and Ruddiman has left, in a pamphlet connected with the subject of our memoir, a manuscript note, observing, “I was so sensible of the weakness and folly of that man, that I shunned his company as far as decently I could.” Ruddiman’s opinion, however, if early entertained, did not prevent him from forming an intimate literary connection with its subject.

In 1738 Lauder printed a proposal to publish by subscription *A Collection of Sacred Poems*, “with the assistance of Professor Robert Stewart, Professor John Ker (professor of Greek in Aberdeen, and afterwards of Latin in Edinburgh), and Mr. Thomas Ruddiman.” The promised work was published by Ruddiman in 1739, and forms the two well-known volumes called *Poetiarum Scriptorum Musa Sacra*.³ What assistance Stewart and Ker may have given to this work appears not to be known; Ruddiman provided several notes and three poems. This work was creditable both to the scholar and typographer. It contains a beautiful edition of the translation of the Psalms and the Song of Solomon by Arthur Johnston, and similar sacred poems of merit by Ker, Adamson, and Hog; it contains likewise a reprint of Eglisliam’s somewhat ludicrous attempt to excel Buchanan’s best translated psalm, the 104th,⁴ with

the sarcastic “judicium” of Barclay on the respective merits of the competitors,⁵ and several minor sacred poems by Scottish authors are dispersed through the collection. The classical merit of these elegant poems has, we believe, never been disputed by those who showed the greatest indignation at the machinations of their editor; nor is their merit less, as furnishing us with much biographical and critical information on the Latin literature of Scotland, among which may be mentioned a well-written life of Arthur Johnston, and the hyperbolic praises which proved so detrimental to the fame of that poet. To support the fame of the author he had delighted to honour, Lauder afterwards engaged in the literary controversy about the comparative merits of Buchanan and Johnston, known by the name “Belum Grammaticale.”⁶

In 1740 the General Assembly recommended the Psalms of Johnston as a useful exercise in the lower classes of the grammar-schools; but Lauder never realized from his publication the permanent annual income which he appears to have expected, “because,” says Chalmers, “he had allowed expectation to outrun probability.” In 1742 Lauder was recommended by Mr. Patrick Cumming, professor of church history in the university of Edinburgh, and the celebrated Colin Maclaurin, as a person fitted to hold the rectorship of the grammar-school of Dundee, which had been offered to his coadjutor Ruddiman in 1710; he was again, however, doomed to suffer disappointment, and in bitterness of spirit, and despair of reaching in his native place the status to which his talents entitled him, he appears to have fled to London, where he adopted the course which finally led to the ruin of his literary reputation. His first attempts on the fame of Milton were contained in letters addressed to the *Gentleman’s Magazine* in 1747, which that publication, certainly without due caution regarding charges so suspicious, unreservedly admitted for publication. The literary world indeed received the attacks on the honesty of the great poet with singular complacency, and the periodicals contained praises of the acuteness and industry of Lauder, some of which he afterwards ostentatiously published. The first person who attempted a discovery of the true merit of the attack was the Rev. Mr. Richardson, author of *Zoilomastix*, who, on the 8th of January, 1749, wrote a letter to the editor of the *Gentleman’s Magazine*, in which he maintained the falsity of Lauder’s quotations from some books not very well known even to the learned world, particularly insisting that the passage “non me judice,” which Lauder had “extracted” from Grotius, was not to be found in that author, and that passages said to be from Masenius and Staphorstius belonged to a partial translation of Milton’s *Paradise Lost* by Hog, who had written twenty years subsequently to the death of Milton.⁷ Although the editor of the *Gentleman’s Magazine* arrogated to himself the praise of candour for admitting the strictures of Lauder, yet this communication was not published until the forgeries had been detected in another quarter, on the ground of unwillingness to give currency to so grave and unexpected a charge, without full examination.

In 1750 Lauder, having brought his design to ma-

⁶ For farther information on this matter see the memoir of ARTHUR JOHNSTON in this Collection. The reader may remark that we have there praised the classical acquirements of Auditor Benson if he was the author of the life of Johnston prefixed to the edition of his *Psalms*. The circumstance that the life in the *Musa Sacra* is exactly the same leads to the conclusion that it is by Lauder.

⁷ *Gent. Mag.* xx. 535.

turity, published his *Essay on Milton's Use and Imitation of the Moderns* in his "Paradise Lost," to which he prefixed as a motto the very appropriate line from the author he traduced, "Things unattempted yet in prose or rhyme." The reader is aware that this book consists of a tissue of passages from obscure authors, from which it is maintained that Milton surreptitiously filched the materials of *Paradise Lost*. In the list are two of the critic's own countrymen, Andrew Ramsay and Alexander Ross, both respectable Latin versifiers and good scholars, but neither likely to have been suspected of giving much aid to Milton; in the introduction of the former of these the critic may have gratified a little family pride—he was father-in-law to Lord Fountainhall, and consequently a connection or relation of the author. Had the author confined his book to the tracing of such passages of Milton as accident has paralleled in far inferior poems, he might have produced a curious though not very edifying book: and, indeed, he has given us a sufficient number of such genuine passages to make us wonder at his industry, and admire the ingenuity with which he has adapted them to the words of Milton; but when he produces masses of matter, the literal translations of which exactly coincide with the poem unequalled in the eyes of all mankind, we express that astonishment at the audacity of the author which we would have felt regarding the conduct of Milton had the attempt remained undetected. As he spreads a deeper train of forgery and fraud round the memory of his victim, the author's indignation and passion increase, and from the simple accusation of copying a few ideas and sentences from others, passion and prejudice rouse him to accuse Milton of the most black and despicable designs in such terms as these: "I cannot omit observing here that Milton's contrivance of teaching his daughters to read, but to read only, several learned languages, plainly points the same way as Mr. Phillips' secreting and suppressing the books to which his uncle was most obliged. Milton well knew the loquacious and incontinent spirit of the sex, and the danger, on that account, of intrusting them with so important a secret as his unbounded plagiarism: he therefore wisely confined them to the knowledge of the words and pronunciation only, but kept the sense and meaning to himself." It is generally believed that a character for probity is so dear to every man, that nothing but the temptation of gain, mingled generally with a prospect of concealment, will prompt a man to dishonesty. Here, however, was a man whose object could not be gain, courting that which depends more than any other acquisition upon probity of mind—real or assumed fame; and doing so by a bold act of dishonesty, which could not escape discovery, and which, in proportion as he had traduced others, would be revisited upon himself. "As I am sensible," he solemnly says at the conclusion, "this will be deemed most outrageous usage of the divine, the immortal Milton, the prince of English poets, and the incomparable author of *Paradise Lost*, I take this opportunity to declare, in the most solemn manner, that a strict regard to TRUTH alone, and to do justice to those authors whom Milton has so liberally gleaned, without making the least distant acknowledgment to whom he stood indebted: I declare, I say, that these motives, and these only, have induced me to make this attack upon the reputation and memory of a person hitherto universally applauded and admired for his uncommon poetical genius: and not any difference of country, or of sentiments in political or religious matters, as some weak and ignorant minds may imagine, or some malicious persons may be disposed

to suggest." The violence of party spirit to which Lauder here alludes has been alleged as a partial excuse, or rather motive, for his audacious act: but it may be more charitably, if not more naturally, presumed, that the accidental discovery of a few of the parallel passages we have alluded to above had prompted him to form a theory of universal plagiarism on the part of Milton, which a more than ordinary perverseness in favour of the creation of his own mind prompted him rather to support by falsehood than resign; while, as he afterwards partially admitted, spleen and disappointment may have sufficiently blackened his heart to make him scruple at no means of gaining celebrity, and triumphing over the world that had oppressed him. Add to this the angry feelings which may have been roused, and the real injury done to his interest, by a ludicrous contrast of his favourite author Johnston with Milton, in that passage of the *Dunciad* which is levelled at the literary predilections of Benson:—

"On two unequal crutches propp'd he came;
Milton's on this, on that one Johnston's name."

There is no crime so severely punished by the world as injustice, which is always repaid by a repetition of itself; hence the learned world which applauded the courage and ingenuity of Lauder, on the appearance of a full and explicit detection of his crimes, by his countryman Dr. Douglas,¹ were seized with a confirmed hatred against the person who had duped them, and would not admit to his degraded name the talents and information he undoubtedly possessed and displayed. Lauder subscribed a confession, addressed to Dr. Douglas, explaining his whole conduct to have been caused by the neglect with which the world had looked on his previous labours. This confession is said to have been dictated by Dr. Johnson, who was one of those on whom Lauder had imposed, or rather of those who chose to submit to be imposed on, which we may safely trace, in his case, to the grudge he never ceased to bear towards the republican poet. The connection of Johnson with Lauder's work is indeed somewhat mysterious. In a manuscript note on the margin of Archdeacon Blackburne's remarks on the life of Milton, Johnson has said, "In the business of Lauder I was deceived, partly by thinking the man too frantic to be fraudulent."² But others have alleged, that he did more than believe the statements of Lauder, and even gave assistance to the work. Dr. Lort had a volume of tracts on the controversy, in which he wrote, "Dr. Samuel Johnson has been heard to confess, that he encouraged Lauder to this attack upon Milton, and revised his pamphlet, to which he wrote a preface and postscript." On the same subject Dr. Douglas remarks, "It is to be hoped, nay, it is expected, that the elegant and nervous writer whose judicious sentiments and inimitable style point out the author of Lauder's preface and postscript, will no longer allow one to plume himself with his feathers who appeareth so little to deserve assistance; an assistance which, I am persuaded, would never have been communicated, had there been the least suspicion of those facts which I have been the instrument of conveying to the world in these sheets."³ Boswell repels the insinuation that Johnson assisted in the preparation of the body of the work, assuring us that Douglas did not wish to create such a suspicion; while he acknowledges the preface and postscript to

¹ Milton Vindicated from the charge of Plagiarism brought against him by Lauder; and Lauder himself convicted of several forgeries and gross impositions on the public, in a letter addressed to the Right Hon. the Earl of Bath, 1751 (by Dr. Douglas, afterwards Bishop of Salisbury).

² Nichols' *Anecdotes*, ii. 551.

³ Second edition, 78.

have been the work of his hands.¹ On a first perusal of the book we were indeed struck with the sonorous eloquence and majesty of the commencement and termination, when compared to the bareness of the other portions of the work, and a slight hint is quite sufficient to convince us of the authorship. The postscript contains matter much at variance with the other contents of the book, and had it been the work of Lauder, it might have gone far to redeem at least the soundness of his heart from the opprobrium which has been heaped upon him. It called for the admirers of Milton's works to join in a subscription to the grand-daughter of Milton, who then lived in an obscure corner of London, in age, indigence, and sickness.

Notwithstanding his penitence, a desire to traduce the fame of Milton seems to have haunted this unhappy man like an evil spirit. In 1754 he published *The Grand Impostor Detected, or Milton detected of Forgery against King Charles I.* An answer to this pamphlet appeared in the *Gentleman's Magazine* for 1754, supposed to be from the hand of Johnson. After this period Lauder quitted England, and for some time taught a school in Barbadoes. "His behaviour there," says Nichols, "was mean and despicable; and he passed the remainder of his life in universal contempt. He died some time about the year 1771, as my late friend Isaac Reed was informed by the gentleman who read the funeral service over him."² Chalmers mentions that there was published in 1754 (probably just after his retreat from London), a pamphlet entitled "*Furtus: or a Modest Attempt towards a History of the Life and Surprising Exploits of the Famous W. L., Critic and Thief-catcher,*" a somewhat inappropriate name for the traducer of Milton.

LAW, JOHN, of Lauriston, comptroller-general of the finances of France under the regency of Orleans, was born at Edinburgh, in the month of April, 1671. His mother, Jean Campbell, was descended from one of the numerous branches of the ducal house of Argyll. His father, William Law, was great-grandson of James Law, Archbishop of Glasgow, and second son of James Law of Brunton in Fife. William Law acquired a considerable fortune by his profession as a goldsmith in the Scottish metropolis, and purchased the two estates of Lauriston and Randleston, a property of about 180 acres in the parish of Cramond and county of Edinburgh. He died shortly after making this purchase leaving an only son, the subject of the present memoir, then fourteen years of age.

John received his education at Edinburgh, and early evinced an uncommon aptitude for the more abstruse branches of study. He likewise became skilled in games of dexterity and hazard, and acquired an enviable reputation in the tennis-court, a place of amusement then much frequented by young men of fashion in Scotland. But the early death of his father had relieved him from many salutary restraints, and *Beau Law*—as he was commonly called by his companions—shortly after reaching majority, found his affairs in a state of embarrassment, from which they were only extricated by the kindness and excellent management of his mother, who having obtained a disposition of the fee of Lauriston from her son, paid his debts, relieved the estate of its encumbrances, and executed an entail of the property.

Law was now in London, where his personal accomplishments, fascinating manners, and devotion

to gambling, procured him admittance into some of the first circles. An affair of gallantry, however, with another dissolute young man, led to a hostile meeting, in which Law killed his antagonist on the spot. After a trial before the king and queen's commissioners in the Old Bailey, which lasted three days, the jury found the survivor in this duel guilty of murder, and sentence of death was accordingly passed upon him, 20th April, 1694. On a representation of the case to the crown, Law obtained a pardon; but was detained in the King's Bench in consequence of an appeal against this extension of royal clemency towards him having been lodged by a brother of the deceased. He found means, however, to make his escape, and got clear off to the Continent.³

Law was at this critical period of his life in the twenty-sixth year of his age. His dissipation had not destroyed the tone of his mind, nor enfeebled those peculiar powers which had so early developed themselves in him. He visited France, then under the brilliant administration of Colbert, where his inquiries were particularly directed to the state of the public finances, and the mode of conducting banking establishments. From France he proceeded to Holland, where the mercantile system of those wealthy republicans who had succeeded the merchant princes of Venice in conducting the commerce of Europe, presented to his mind a vast and most interesting subject of investigation. Amsterdam was at this period the most important commercial city in Europe, and possessed a celebrated banking establishment, on the credit of which her citizens had been enabled to baffle the efforts of Louis XIV. to enslave the liberties of their country; a treasury, whose coffers seemed inexhaustible, and the whole system of which was an enigma to the political economists of other countries. Law, with the view of penetrating into the secret springs and mechanism of this wonderful establishment, took up his residence for some time at Amsterdam, where he ostensibly officiated as secretary to the British resident.

About the year 1700 he returned to Scotland. He was now nearly thirty years of age, and had acquired a more accurate acquaintance with the theory of commercial and national finances, as well as with their practical details, than perhaps any single individual in Europe possessed at this time. The contrast which Scotland presented to those commercial countries which he had visited during his exile now struck him forcibly, and he immediately conceived the design of creating that capital to the want of which he attributed the depressed state of Scottish agriculture, manufacture, and commerce. Law's views were not without foundation; but unfortunately, he stumbled at the outset, by mistaking the true nature of capital. The radical delusion under which he laboured from the outset to the close of his financial career, originated in the idea which had got possession of his mind, that by augmenting the circulating medium of a country we proportionally augment its capital and productive energies. Now, money is not always convertible into capital, that is, into something which

³ On this occasion the following advertisement was published in the *London Gazette* of Monday, 7th January, 1695: "Captain John Law, a Scotchman, lately a prisoner in the King's Bench for murder, aged 26, a very tall, black, lean man, well shaped, above six feet high, large pocket-holes in his face, big high nosed, speaks broad and loud, made his escape from the said prison. Whoever secures him, so as he may be delivered at the said prison, shall have fifty pounds paid immediately by the marshal of the King's Bench." We may here observe, that this description was upon the whole inaccurate, and leaves room to believe that it was designed rather with the view of facilitating than impeding his escape.

² *Anecdotes*, ii. 157.

may be employed towards further production; for the creation of exchangeable products must, in the nature of things, precede the creation of a general medium of commerce, and it is quite evident, that if we double the amount of the circulating medium without doubling the products of industry, we just depreciate the currency in the degree of the excess, and do not increase the resources or industry of a country in the least. But Law conceived that to her overflow of money alone Holland owed her national prosperity; and he calculated that the increase of the circulating medium in Scotland would be absorbed by the increase of industry, and have no other effect than to lower the rate of interest. This view he developed in a publication entitled *Proposals and Reasons for Constituting a Council of Trade*, dated at Edinburgh, 31st December, 1700, and published at Glasgow in the following year; and in a second and more important work, entitled "*Money and Trade Considered*," printed at Edinburgh in 1703.

In the latter work Law developed his views of banking and the credit system. He proposed to supply Scotland with money by means of notes to be issued by certain commissioners appointed by parliament; which notes were to be given out to all who demanded them, upon the security of land. In answer to the supposition, that they might be depreciated by excess or quantity, he observed, that "the commissioners giving out what sums are demanded, and taking back what sums are offered to be returned, this paper-money will keep the value, and there will always be as much money as there is occasion or employment for, and no more." Here his project evidently confounds the quantity of good security in the country, and the quantity of money which people may wish to borrow at interest, with the quantity necessary for the circulation, so as to keep paper-money on a level with the precious metals and the currency of surrounding countries—a mistake which has prevailed to a very considerable extent in our own times. But notwithstanding of this capital error, Law has in the latter publication developed the principles and mechanism of banking in an astonishingly able and luminous manner for the period at which he wrote. The court party, and the *squadron*, headed by the Duke of Argyle and the Marquis of Tweeddale, entered warmly into Law's views; but parliament passed a resolution "that to establish any kind of paper-credit, so as to oblige it to pass, were an improper expedient for the nation."

Law now resolved to offer his system to some of those continental states whose finances had been exhausted by the wars of Louis XIV., and in which the principles of credit were imperfectly understood. With this view he went to Brussels, and from that city proceeded to Paris, where he won immense sums at play, and introduced himself into the good graces of the young Duke of Orleans. The Succession war was at this moment occupying the attention of the French court; Chamillart, unable to extricate himself from the difficulties of his situation in any other manner, was about to resign his functions as minister of finance; the moment appeared favourable to our projector, and he made offer of his services to the French monarch. But the leading men of the day were totally unable to comprehend the plans of the new financier, and the name of Huguenot was no passport to the royal favour: so that the unexpected result of this negotiation was an order from the intendant of police to quit Paris in twenty-four hours as a state-enemy. Law found himself in a similar predicament at Genoa and Turin, but not before he had pursued his usual run of luck at the gaming-

tables in these cities. After visiting several other continental cities, in all of which his fascinating manner procured him admission to the first circles, our adventurer found himself possessed of a tangible fortune of considerably more than £100,000—the fruits of his skill and success at play. The death of Louis XIV., the succession of the Duke of Orleans to the regency, and the deplorable state of the French finances, prompted Law to present himself once more to the attention of the French ministry.

During the war of Succession—now brought to a close—Demarest, who had succeeded Chamillart as comptroller-general, had exhausted every possible means of raising money; he had issued promissory notes under every conceivable name and form—*promesses de la caisse des emprunts, billets de Legendre, billets de l'extraordinaire des guerres*—but all without success; the credit of the government was gone, and its effects of every description had sunk from seventy to eighty per cent. in value. In this extremity the expedient of a national bankruptcy was proposed to and rejected by the regent, who also refused to give a forced circulation to the royal billets, but appointed a commission to inquire into the claims of the state-creditors. The commission executed its duties with great ability; but after reducing the national debt to its lowest possible form, and providing for the payment of the interest, amounting to 80,000,000 of livres, or about one-half of the revenue, there hardly remained a sum sufficient to defray the ordinary expenses of the civil government, and that too, after having had recourse to a measure tantamount, in its effects at least, to a breach of faith, namely, a change in the nominal value of the currency. By the latter scheme the government foolishly imagined that they would pocket 200,000,000 of livres, but the sum on which they had calculated only went into the pockets of the Dutch and the clandestine money-dealers. At this critical juncture Law stepped forward, in the full confidence of being yet able to rescue the government from bankruptcy, by the establishment of a well-regulated paper-credit. His first proposal was to establish a national bank, into which was to be transferred all the metallic currency of the nation, which was to be replaced by bank-notes. Law regarded the whole nation as one grand banking company, and his reasoning was this:—If a bank may increase the issue of its notes beyond the amount of its funds in bullion without risking its solvency, a nation may also do the same. But the private fortunes of the individuals of a nation, it is quite evident, can never be held as security for the notes which the sovereign authority may choose to issue; and unless such security is to be found in the resources of the government itself, it is equally clear that a paper-currency might sink in the course of a few months fifty or a hundred per cent. below the value of the precious metals, and deprive individuals of half or the whole of their fortunes. Law seems to have regarded *credit* as everything—as intrinsic worth—as specie itself. Still, notwithstanding this capital delusion, the memoirs which he addressed to the regent on the subject contain many just observations on the peculiar facilities afforded to trade by the existence of a paper-currency; though they failed to remove the doubts of one sapient objector, who thought a paper-currency highly dangerous, on account of its liability to being cut or violently destroyed! The council of finance, however, rejected this scheme. The present conjuncture, they thought, was not favourable for the undertaking; and this reason, added to some particular clauses of the project, determined them to refuse it.

Law next proposed a private bank for the issue of

notes, the funds of which should be furnished entirely from his own fortune and that of others who might be willing to engage with him in the speculation. He represented the disastrous consequences which had resulted from a fluctuating currency, the enormous rate at which discounts were effected, the difficulties in the exchange between Paris and the provinces, and the general want of an increased currency; and succeeded in convincing the regent that these evils might be obviated by the adoption of his plans even in their limited modification. The bank was accordingly established by letters-patent, bearing date the 2d of May, 1716. Its capital was fixed at 1200 shares of 5000 livres each, or about £300,000 sterling. The notes were payable at sight in specie of the same weight and fineness as the money in circulation at the period of their issue; and hence they soon bore a premium above the metallic currency itself, which had been subjected to many violent alterations since 1689. The good faith which the bank observed in its proceedings, the patronage which it received from the regent, and the want of private credit, soon procured for it a vast run of business. Had Law confined his attention to this single establishment, he would justly have been considered as one of the greatest benefactors of the country, and the creator of a beautiful system of commercial finance; but the vastness of his own conceptions, his boundless ambition, and the unlimited confidence which the public now reposed in him, suggested more gigantic enterprises, and led the way to that highly forced and unnatural system of things which eventually entailed ruin upon all connected with it.

Law had always entertained the idea of uniting the operations of banking with those of commerce. Every one knows that nothing can be more hazardous than such an attempt; for the credit of the banker cannot be made to rest upon the uncertain guarantee of commercial speculations. But the French had yet no accurate ideas on this subject. Law's confidence in the resources of his own financial genius was unbounded, and the world at this moment exhibited a theatre of tempting enterprise to a comprehensive mind. The Spaniards had established colonies around the Gulf of Mexico—the English were in possession of Carolina and Virginia—and the French held the vast province of Canada. Although the coast lands of North America were already colonized, European enterprise had not yet penetrated into the interior of this fertile country; but the Chevalier de Lasalle had descended the Mississippi to the Gulf of Mexico, and taking possession of the country through which he passed in the name of the French monarch, gave it the appellation of Louisiana. A celebrated merchant of the name of Crozat had obtained the privilege of trading with this newly discovered country, and had attempted, but without success, to establish a colony within it. Law's imagination, however, was fired at the boundless field of enterprise which he conceived was here presented; he talked of its beauty, of its fertility, of the abundance and rarity of its produce, of the richness of its mines, outrivalling those of Mexico or Peru—and in the month of August, 1717, within five months after his embarkation in the scheme of the bank, our projector had placed himself, under the auspices of the regent, at the head of the famous Mississippi scheme, or West Indian Company. This company was invested with the full sovereignty of Louisiana, on condition of doing homage for the investiture to the King of France, and presenting a crown of gold, of thirty marcs, to each new monarch of the French empire on his accession to the throne.

It was authorized to raise troops, to fit out ships of war, to construct forts, institute tribunals, explore mines, and exercise all other acts of sovereignty. The king made a present to the company of the vessels, forts, and settlements which had been constructed by Crozat, and gave it the monopoly of the beaver trade with Canada for twenty-five years. In December following the capital of the West Indian Company was fixed at 100,000,000 livres, divided into 200,000 shares; and the *billets d'état*, were taken at their full value from those wishing to purchase shares. Government paper was at this moment vastly depreciated on account of the irregular payment of the interest; but although 500 livres nominal value in the public funds could not have been sold for more than 150 or 160 livres, the *billets d'état*, by this contrivance, soon rose to par. It was evident that these fictitious funds could not form stock for commercial enterprise; nevertheless, the advance of the government debts to a rate so advantageous to the holders, increased the value of the government securities that remained in circulation, and the depreciated paper rose to full credit with the astonished public, who now began to place implicit confidence in Law's schemes. The council of finance, however, looked with mistrust on these proceedings; and its president, the Duke de Noailles, gave in his resignation, and was replaced by D'Argenson, a man far less skilled in matters of finance. The jealousy of the parliament, too, was excited by the increasing influence of the Scottish financier, who had been heard imprudently to boast that he would render the court independent of parliamentary supplies. By an *arrêt* of the 18th of August, 1717, the parliament attempted to destroy the credit of the notes of the bank, by prohibiting the officers of the revenue from taking them in payment of the taxes; but the regent interposed, and Law was allowed to continue his operations. He, however, encountered another formidable rival in D'Argenson, who now proposed, with the assistance of the four brothers Paris, men of great wealth and influence in the commercial world, to form a company, which, with a capital as large as that of the West Indian Company, should advance large sums of money secured on the farms, posts, and other branches of the public revenue. This anti-system, as it was called, soon fell to pieces for want of the same energetic and fearless direction which characterized the schemes of its rival.

Law now prevailed on the regent to take the bank under royal guarantee, persuading him that it was quite possible to draw into it the whole circulating specie of the kingdom, and to replace it by the same amount of paper-money. The notes issued by the royal bank, however, did not promise, as those of Law's private establishment had done, to pay in specie of the same weight and fineness as the specie then in circulation, but merely to pay in silver coin. This opened a door for all the fluctuations which might occur in the real value of the coin called a livre, affecting the value of the paper-money. Law was made director-general of the royal bank, which, in a few months, issued 1,000,000,000 of livres in new notes; "less," says the royal *arrêt*, "not being sufficient for its various operations:" although this sum was more than all the banks of Europe could circulate, keeping good faith with their creditors. The director-general found it extremely difficult to support the credit of such an enormous issue, and for a while hesitated between the plan of insensibly transforming bank-notes into a real paper-money, by giving the latter a decided advantage over specie, which should be kept constantly fluctuating, and by receiving it in payment of the taxes; or of creating a

new and apparently lucrative investment for this paper, so as to prevent its returning upon the bank to be exchanged for specie. The latter plan appeared at last the preferable one. A colossal establishment was projected with a capital equal in amount to the public debt. This capital was to be divided into shares, which the regent was to buy with the paper-money that he was to manufacture; he was then to borrow this paper anew to pay the creditors of the state; and then by selling the shares, to retire the paper-money, and thus transfer the creditors of the state to the company.

Accordingly in May, 1719, the East India Company, established by Richelieu in 1664, the affairs of which were then at a very low ebb, was incorporated with that of the West Indies; and the conjoined companies received the name of the Company of the Indies, "with the four quarters of the world to trade in." "Moreover," says the edict issued on this occasion, "beside the 100,000,000 of public debts already subscribed into the Western Company's capital, there shall be a new subscription of 50,000 shares of 550 livres each, payable in specie." In a short time the newly created company engaged, by extending its capital to 624,000 shares, to lend the king the immense sum of 1,600,000,000, at three per cent. interest, and declared itself in a condition to pay a dividend of 200 livres upon each share. The public faith being yet unshaken, the shares hereupon rose to 5000 livres; and when the king began to pay off the state-creditors with the loan now procured, many not knowing how to employ their capital, a new competition for shares in the great company arose, and shares actually rose in consequence to 10,000 livres. The slightest consideration might have served to convince any cool speculator that the company had come under engagements which, in no circumstances however prosperous, it could fulfil. How was it possible that the company could raise annually 124,800,000 livres for the dividend upon 624,000 shares? Or supposing it able to make an annual dividend of 200 livres a share, still the rate of interest being at this time about four per cent., the shareholder who had bought in at 10,000 thus lost one-half of the revenue he might otherwise have drawn from the employment of his capital. The truth is, the whole scheme was designed for the sole purpose of relieving the state from its debts by the ruin of its creditors; but the immense fortunes which were realized by stock-jobbing at the very outset of the scheme led on others to engage in the same speculation; splendid fortunes were realized in the course of a single day; men found themselves suddenly exalted, as if by the wand of an enchanter, from the lowest station in life to the command of princely fortunes; 1200 new equipages appeared on the streets of Paris in the course of six weeks, half a million of people hastened from the country, and even from distant kingdoms, to procure shares in the Indian Company; and happy was he who held the greatest number of these bubbles. The negotiations for the sale and purchase of shares were at first carried on in the Rue Quincampoix, where fortunes were made by letting lodgings to the crowds who hastened thither for the purpose of speculating in the stocks. The murder of a rich stock-jobber, committed here on the 22d of March, 1720, by a young Flemish nobleman, occasioned the proscription of that street as a place of business, and the transference of the stock-jobbing to the Place Vendome, and finally to the Hotel de Soissons, which Law is said to have purchased from the Prince of Carignan for the enormous sum of 1,400,000 livres.

Innumerable anecdotes are on record of the extra-

ordinary vicissitudes of fortune which took place during this season of marvellous excitement; footmen stepped from the back to the inside of carriages; cooks appeared at the public places with diamond necklaces; butlers started their berlins; and men educated in poverty and of the lowest rank suddenly exchanged the furniture and utensils of their apartments for the richest articles which the upholsterer and silversmith could furnish. Law himself, now arrived *summa ad vestigia rerum*, shone super-eminent above all the other attractions of the day; princes, dukes, marshals, prelates, flocked to his levees, and counted themselves fortunate if they could obtain a smile from the great dispenser of fortune's favours; peeresses of France, in the excess of their adulations, lavished compliments upon the Scottish adventurer which set even decency at defiance; his daughter's hand was solicited by princes; and his lady bore herself with hauteur towards the duchesses of the kingdom. Land in the neighbourhood of Paris rose to eighty or a hundred years' purchase; the ell of cloth of fifteen livres sold for fifty; coffee rose from fifty sous to eighteen livres; stock-jobbers were known to treat their guests to green pease at a hundred pistoles the pint; every yard of rich cloth or velvet was bought up for the clothing of the new *élèves* of fortune; and the value of the silver-plate manufactured in the course of three months for supplying the demands of the French capital amounted to £7,200,000! The regent, sharing in the general delusion, wished to place the wonderful foreigner at the head of the finances of the kingdom; but then, in addition to his being an alien, he was a Protestant also; so l'Abbé de Tencin was charged with the important duty of his conversion, and this ecclesiastic succeeded so well in the task assigned to him, that on the 5th of January, 1720, all obstacles being removed, Law was elevated to the comptroller-generalship of the finances of France, and for some time after his elevation to the premier-ship governed France with almost absolute power. Law's fame had now reached its acmé; his native city of Edinburgh hastened to transmit to her illustrious son the freedom of citizenship in a gold box of the value of £300; the Earl of Ilay republished some of his works with an adulatory preface; British noblemen disdained not to pay their court to so successful an adventurer; even the Earl of Stair, then the British ambassador at Paris, trembled at the idea of Law's overweening influence in the affairs of France, and viewed his boastful speeches in so serious a light, as to deem them matter of grave communication and advice to his government—a piece of good faith for which the meritorious and discerning minister met with small thanks.

The great drama, however, which Law was now enacting before the astonished eyes of all Europe was soon to shift; the glittering bubble on which he had fixed the eyes and expectations of all France was rapidly attenuating to its explosion; the charm by which he had swayed the mind of the million lay not in the rod of the magician, but in the implicit faith which people reposed in the skill and the power of its master—and, that faith once shaken, the game of delusion was over.

We have said that the shares of the India Company had risen to 10,000 livres each in the month of November, 1719. So long as they kept at this elevation the credit of the bank remained unshaken. Its notes were found so very convenient in conducting the rapid negotiations of the Rue Quincampoix, that they were sought after with avidity, and even bore a premium of ten per cent. in exchange for specie! Notwithstanding, however, of the bound-

less delusion under which men acted at this moment, it could not escape the eyes of the vigilant financier, that a constant and enormous drain of specie was going on, either in the way of exportation to foreign countries, or for the consumption of the jewellers and goldsmiths. To answer the large orders of the wealthy Mississippians, and to guard against a run upon the bank in these circumstances, the master-projector had again recourse to forced measures. Edicts were issued declaring the value of bank-notes to be five per cent. above that of specie, and forbidding the use of silver for the payment of any sum exceeding 100 livres, or of gold in payments exceeding 300 livres. Law thought by these expedients to confine the use of specie to small transactions alone, while those of any magnitude could still be conducted by the fictitious currency which he had called into existence. At the same time, to give a fresh impulse to the stock-jobbing transactions, which had experienced a perceptible decline, he presented himself personally in his ministerial robes, and surrounded by a number of the nobility, in the Rue Quincampoix, where his presence instantly excited a lively sensation; and the report being industriously propagated that new edicts were about to be issued, conferring additional privileges on the great company, the actions which had fallen to 12,000 livres rose to 15,000. Still the public creditors hesitated to employ the notes now issuing in extinction of their debts in purchasing India stock; and the enormous sum of 1,000,000,000 remained floating in the form of bank-notes, for which no species of investment could be found.

A publication issued at this juncture by Law, under the title of *Lettre à un Créancier*, failed to satisfy their scruples, and actions again fell to 12,000 livres. Meanwhile specie, in spite of successive depreciations effected upon it at the suggestion of the minister of finance, entirely disappeared; still the government kept issuing notes to the immense amount of 1,925,000,000, between the 1st of January and the 20th of May, 1720, and the price of everything advanced in almost hourly progression. On the 11th of March a second letter from the minister of finance appeared, in which he employed the most ingenious sophistry in defence of the exaggerated value at which the paper-currency was attempted to be maintained. The choice of a standard value, the great financier contended, was wholly a matter of opinion. To support the value of any article in the opinion of the community, it is only necessary to decline selling it under a certain price. Houses, lands, and other articles of property, have a certain value in the opinion of mankind, just because some people desire to purchase them, and others will not part with them; but if all the proprietors of houses and land were willing to get rid of their property at one and the same time, what value would it have in the market? It is easy to answer such palpable sophistry as this. Houses and lands are possessions fit for certain purposes which men require; it is their fitness which constitutes their value; but in the case of those shares, whose value, Law contended, ought to be quite as real as that of any other article of property, it is most evident that they have no value, unless the profit to be derived from commerce in them be not proportioned to the price at which the stock was purchased; from the moment, in fact, that they cease to become marketable they are stripped of their value. A system supported by such desperate reasoning as Law had here recourse to must have appeared tottering to its fall in the eyes of every rational man; the public credit of France was about to give way; the Atlantean shoulders on which it had been hitherto

supported could no longer prop the mighty burden. Government at last perceived that too great an extension had been given to what Law called *credit*, and that to re-establish the value of paper, it would be necessary to diminish its amount. On the 21st of May the death-blow was given to the whole gigantic system of our Scottish projector, by an edict which announced that a progressive reduction of the India Company's actions, and of bank-notes, was to take place from that day till the 1st of December, when it was declared that the bank-notes should remain fixed at one-half of their present value, and the actions at four-ninths. Law, whose influence with the government was now rapidly sinking, or rather was annihilated, felt himself too weak to resist this measure, and actually consented to announce it himself. The public eye was now opened in one instant to the delusion which had been practised upon it, and the next day every one was anxious to get rid of his paper-money at any sacrifice. The catastrophe, though inevitable in the nature of things, was hastened by the artifices of the Cardinal Dubois, who used every means to injure Law in the opinion of the regent; and by the irritation of the finance-general and the parliament of Paris, who regarded the foreign projector as their bitter enemy. The united efforts of such a powerful party appear to have made a deep impression on the mind of the regent, who, in a letter of Lord Stair's, dated 12th March, 1720, is represented as abusing the comptroller cruelly to his face, and even threatening him with the Bastille. The same authority informs us that the minister himself was at this period reeling under the weight of that complicated and stupendous system of which he now found himself the prime support and mover. "Law's head is so heated," he writes, "that he does not sleep at nights, and has formal fits of frenzy. He gets out of bed almost every night, and runs stark-staring mad about the room making a terrible noise—sometimes singing and dancing, at other times swearing, staring, and stamping, quite out of himself. Some nights ago his wife, who had come into the room upon the noise he made, was forced to ring the bell for people to come to her assistance. The officer of Law's guard was the first that came, and found Law in his shirt, who had set two chairs in the middle of the room, and was dancing round them quite out of his wits."

The consequences of this rash edict were frightful; the government was upbraided for having been the first to impeach that credit to which it had itself given original existence, and charged with the design to ruin the fortunes of the citizens; seditious and inflammatory libels were posted throughout the streets; the mob assailed the hotels of Law and other members of the cabinet; and even the life of the regent himself was threatened. In this emergency the parliament assembled on the 27th of May, and terrified at the consequences of their own measures, were about to petition the regent to revoke the unfortunate edict; but while yet deliberating with this purpose, an officer announced to them that the paper had been restored to its former value by a new proclamation. However, if the first step had been bad, the second was little less weak and unwary. To declare that the actions and billets had resumed their full value, was doing nothing of real consequence to allay the ferment of the public mind; for such a measure was founded on no principle which could operate in the slightest degree to restore to paper-money the confidence it had lost; it was doing nothing to recompense those who had already suffered injury, and it was effectually securing the ruin of all others on whom the valueless paper could now be fixed as a

legal tender. And to add to all this confusion and distress, the repositories of the bank were sealed up the same day, under pretence of examining the books, but in reality to prevent the specie from being paid away in exchange for notes. At last, after the first moments of alarm and outrage were over, the regent ventured to resume those expressions of confidence towards Law which he had been compelled to withhold from him for a time; he received him in his own box at the opera, and gave him a guard to protect his hotel from the insult of the exasperated populace. The infamous Dubois, who had enriched himself by his speculations during the height of the Mississippi madness, now united with Law to expel Argenson from the cabinet; and the regent, whose character, though intrepid, was not without its weak points, was persuaded at their instigation to take the seals from his faithful minister, and bestow them upon Agnesseau, who tamely resumed the high office, from which he had been expelled by the very men to whose influence he now beheld himself indebted for his second elevation.

Nothing could now save the system of the great financier; his billets and actions were for ever stripped of their value in the eye of the public; and the most expedient measure that could now be adopted with regard to them, was to withdraw them as promptly as possible from circulation. To demolish in the most prudent manner the vast structure reared by his own labour was now the highest praise to which Law could aspire. By a series of arbitrary financial operations, which it would be tedious here to relate, the public creditors were reduced to the utmost distress, the national debt annihilated, and the whole affairs of the kingdom thrown into the utmost perplexity. "Thus ended," to use the words of Voltaire, "that astonishing game of chance played by an unknown foreigner against a whole nation." Its original success stimulated various individuals to attempt imitations of it—among which the most famous was the South Sea bubble of England, which entailed disgrace and ruin on many thousands of families. It would be doing injustice to Law's character were we to view him as the sole author of these misfortunes: his views were liberal beyond the spirit of the times in which he lived; he had unquestionably the real commercial interests of his adopted foster-country at heart; he did not proceed on speculation alone; on the contrary, his principles were to a certain degree the very same as those the adoption of which has raised Britain to her present commercial greatness, and given an impulse to trade throughout the world, such as was never witnessed in the transactions of ancient nations. His error lay in overestimating the strength and breadth of the foundation on which his gigantic superstructure rested. Unquestionably in his cooler moments he never contemplated carrying the principle of public credit to the enormous and fatal length to which he was afterwards driven by circumstances; it was the unbounded confidence of the public mind, prompted by the desire of gain and the miraculous effects of the system in its earliest development—the enthusiasm of that mind, transported beyond all bounds of moderation and forbearance by a first success eclipsing its most sanguine expectations, realizing to thousands of individuals the possession of wealth to an amount beyond all that they had ever conceived in imagination—the contagious example of the first fortunate speculators intoxicated with success, and fired to the most extravagant and presumptuous anticipations, by which men can be lured into acts of blinded infatuation or thoughtless folly—it was these circumstances, we say, over which Law had necessarily little control, that

converted his projects into the bane of those for whom they were at first calculated to serve as a wholesome antidote.

Law was in fact more intent on following out his idea than aggrandizing his fortunes. Riches, influence, honours, were showered upon him in the necessity of things; the man who had given birth to the wealth of a whole kingdom, whose schemes had for a while invested all who entered into them with imaginary treasures—by whose single mind the workings of that complicated engine which had already produced such dazzling results as seemed to justify the most extravagant anticipations of the future, were comprehended and directed—must have risen during the existence of that national delusion to the highest pinnacle of personal wealth and influence, and might, though only endowed with a mere tithe of the forecasting sagacity of Law, have provided for his retreat, and secured a sufficient competency at least beyond the possibility of loss or hazard, as thousands in fact did upon the strength of his measure. But Law, in deluding others, laboured under still stronger delusion himself; like the fabled Frankenstein, he had created a monster whose power he had not at first calculated, and the measure of which he now found he could not prescribe, and he awaited the result with mingled feelings of hope, fear, and distrust. It was the ignorant interference of others with his own mysterious processes which finally determined the fatal direction of those energies which he had called into being, and which he might have been able, if not to restrain, at least to direct in another and less ruinous manner. We are far from professing ourselves the unqualified apologists of our enterprising countryman. It was criminal in him to make use of remedies of such a desperate kind as those to which he had recourse when his system began to stagger under its first revulsions; doubtless his temptations were strong, but, invested as he was with authority, it was in his power to have resisted them, and adopted a less empirical mode of treatment. In estimating his moral character, it does not appear to us that his renouncing Protestantism, under the circumstances in which he was placed, ought to weigh much against the uprightness of his intentions. Religion was with him a matter of inferior moment. In his previous life he had manifested no symptoms of piety; an utter stranger to the faith and power of the gospel, Protestantism was superior to any other *ism* with him, just in as far as it favoured his worldly policy. He believed himself possessed of means to elevate a whole nation in the scale of wealth and power, with all their attendant benign influences, and to give an impulse by means of the fortunes of France to the destinies of the human species: and is it to be supposed that this consideration, thrown into the balance, should not have caused that scale in which was placed a mere nominal profession of a religion—the truth of which he neither knew nor respected—to kick the beam?

Before resuming the thread of our biography, let us for a moment compare the financial catastrophe we have now been considering with that of the assignats of revolutionary France, and the celebrated crisis of the Bank of England in 1797: we shall discover striking points of resemblance in the circumstances which led to these events, and draw from their comparison a few important truths. Credit is founded on the supposition of future value; it is this prospective value which is made to circulate as if it were existing value, in the form of a bank-note. Law founded his schemes upon the great basis of credit, which again he proposed to create by the profits arising from speculation in the shares of his

India Company. The financiers of revolutionary France wished to pay the national debt and the expenses of a universal war with the national funds; but, finding it impossible from the want of public confidence or credit to sell these funds, they anticipated their sale, and represented their supposed future value by paper-money called *assignats*. The Bank of England, in return for its loans to the government, supposed the existence of two species of value, and accepted of these species in payment: the effects themselves, namely, of commerce and the securities of the state; the former a certain value, and the latter necessarily fluctuating with the political aspect of the times. In these three cases we perceive three species of doubtful value; Law's share represented a future, but speculative and very uncertain, value; the *assignats* represented certain funds which might ere long pass from under the hands of their present administrators; and the notes of the Bank of England represented a value depending upon engagements regarding the ability of the state to fulfil which there existed no absolute certainty. Now the crisis produced by the fluctuation of these three species of credit corresponded to the difference of circumstances in the three cases. The sudden displacement of an enormous sum raised the shares of the East India Company to an enormous premium; but a rapidly established credit is exposed to an equally or still more precipitous decline; for that true credit which is founded on the solid basis of real success must necessarily be as slow in its growth as the success itself. The *assignats* again could not experience such a sudden rise in value, for they represented a certain portion of land, a species of value least of all exposed, in the nature of things, to rapid fluctuation. In proportion, however, as the public confidence in the permanence of the administration declined, the *assignats* declined in value; and in proportion as they declined in value, the existing government was compelled to supply the loss of funds by increasing the issue, which again operated to depreciate its paper-money. The notes of the Bank of England, depending on mercantile credit or the real security of responsible funds, as well as on government security, were only slightly affected in credit by the political aspect of the times. In all the three cases public credit was attempted to be supported by forcible measures, the injustice of which was just in proportion to the degree of suspicion attached to that false system of credit which they were designed to support. Law fixed the value of shares in notes, and thus forced a circulation for the latter. The French revolutionary government punished the refusal of its *assignats* at their nominal value with death. In England the bank was relieved of the obligation to cash its notes at sight. Law again endeavours to drive specie altogether out of the market, and render paper the only legal tender; the revolutionists fix the maximum of all exchange; and the Bank of England, whose security was less questionable, threw itself on the patriotism of the London merchants, who relieved it from its embarrassment by agreeing to accept of its notes in payment from their debtors. Thus we see, 1st, that every system of public credit ought to represent a certain real value, and not to be founded on mere anticipation of a value yet to be created; 2dly, that it is impossible by fixed measures to sustain an arbitrary value; and, 3dly, that where forced values are resorted to, they are rejected by all who are at liberty to reject them, and are followed by the ruin of those who are not in a condition to refuse them.

Law, at his last interview with the Duke of Orleans, is reported to have said:—"My lord, I

acknowledge that I have committed great faults; I did so because I am a man, and all men are liable to err; but I declare to your royal highness that none of them proceeded from knavery, and that nothing of that kind will be found in the whole course of my conduct;" a declaration which the regent and the Duke of Bourbon bore frank testimony to, at the same time that they suggested the expediency of his leaving the kingdom, for which purpose they offered to supply him with money, his whole property having been confiscated; but Mr. Law, though in possession of only 800 louis d'ors, the wreck of a fortune of 10,000,000 of livres, refused to receive any assistance from other funds than his own, and on the 22d of December, 1720, arrived at Brussels, where he was received with the greatest respect by the governor and resident nobility. Early in January, 1721, he appeared at Venice, under the name of M. du Jardin, where he is said to have had a conference with the Chevalier de St. George, and the famous Cardinal Alberoni, minister of Spain. From Venice he travelled through Germany to Copenhagen, where he had the honour of an audience with Prince Frederick. During his residence at the Danish capital he received an invitation from the British ministry to return to his native country, with which he complied, and was presented on his arrival to George I. by Sir John Norris, the admiral of the Baltic squadron. On the 28th of November he pleaded at the bar of the King's Bench his majesty's pardon for the murder of Edward Wilson, and was attended on this occasion by the Duke of Argyle, the Earl of Ilay, and several other friends.

Mr. Law's reappearance in Britain excited some uneasy feelings on the part of various senators. The Earl of Coningsby, in particular, moved the House of Lords for an inquiry whether Sir John Norris had orders to bring over a person of his dangerous character. The affair, however, was hushed, and it is thought that he at first received some kind of pension or allowance from the British government. Meanwhile, he maintained a constant correspondence with the regent of France, who caused his official salary of 20,000 livres per annum to be regularly remitted to him, and held several consultations with the council respecting the propriety of recalling him. The sudden death, however, of the regent, on the 2d of December, 1723, was a fatal blow to the reviving hopes of the ci-devant minister of finance. His pension ceased to be remitted, his prospect of a reversion from the sale of his property in France was annihilated, his embarrassments at home increased, and demands were made upon him by the India Company to the enormous amount of 20,236,375 livres. On the 25th of August, 1724, we find him addressing a letter to the Duke of Bourbon from London, in which he writes:—

"Notwithstanding the confusion in which my affairs have become involved, one hour will suffice to put your highness in full acquaintance with them. The subjoined memoir explains by what means I purpose to fulfil my engagements and obtain a livelihood for myself. The means which I suggest are of the very simplest nature. It is likewise the interest of the state that my affairs should be wound up; for although the number of those who desire my return is not great, their confidence in me is considerable, and must either destroy or retard the success of those measures which have been adopted by those persons to whom the king has been pleased to intrust the management of the finances. If my matters were arranged, Madame Law, my daughter, my brother, and his family, would return to England, and I would fix myself here in such a manner as

should convince the public that I entertained no intention of ever again setting foot in France.

"Those who have set themselves to oppose me by retarding the decision in my case have acted thus upon a mistaken principle altogether, and against their own view of things; they accuse me of having done the thing which they would have done themselves if they had been in my place; and in examining into my conduct they are unintentionally doing me a great honour. There are few, perhaps no instances, of a stranger having acquired the unlimited confidence of a prince, and realized a real fortune by means perfectly honourable, and who yet on leaving France reserved nothing for himself and his family, not even the fortune which he had brought into the country with him.

"Your highness knows that I never entertained the idea of making my escape from France. I had made no provision for this purpose when it was announced to me that the regent had ordered me to be provided with passports; for I had indeed at one time thought of quitting the kingdom, when I requested his royal highness' permission to resign my office; but after that I had deliberated upon the reasons which the prince then urged against my taking this step, I renounced the idea altogether, although fully aware of the personal danger to which I would expose myself by remaining in France after having ceased to hold office in the administration.

"I have said that my enemies have advised measures opposed even to their own principles; for if what they allege had been true—if I had carried a great sum of money with me out of the kingdom—it would surely have been their truest policy to have induced me to return with my son. If they had acted dispassionately in this matter they would have afforded me every facility in arranging my affairs; and it is my belief that, had his highness the Duke of Orleans lived, I would have been invited back to France. A short time before the prince's death he was pleased to express his approbation of my conduct; to give me certain marks of his esteem; he was satisfied that my plans would have completely succeeded if the juncture of extraordinary circumstances had not compelled others to interfere with them; he felt that he yet required my assistance; he asked my opinion regarding the present situation of the kingdom; and he was pleased to say that he yet counted on my aid in raising France to her proper elevation and weight in Europe. These are facts with which I am persuaded your highness was made acquainted by the prince himself."

The late M. Law de Lauriston transmitted to Mr. Wood, the biographer of the comptroller-general, a complete copy of the memorial which accompanied this letter, and of which only some detached fragments are published in the *Œuvres de J. Law*, Paris, 1790. Mr. Wood supplies us with the following passage from this document:—"When I retired to Guermande," says the memorialist, "I had no hopes that the regent would have permitted me to leave the kingdom; I had given over all thoughts thereof when your highness sent to inform me of his intention to accord that permission; and the next day, immediately on receiving the passports, I set off. Consider, my lord, if being in the country, removed from any paper and books, it were in my power to put in order affairs that required not only leisure, but also my presence in Paris, to arrange properly; and if it is not a piece of great injustice for the India Company to wish to take advantage of the condition to which I was reduced; and of the dishonest conduct of clerks in requiring from me payment of sums I do not in fact owe, and which, even though I had been

owing, were, as I have shown, expended for their service, and payable in actions or notes, of which effects belonging to me they at that time had, and still have, on their books to the amount of double or treble the sum they demand. No, my lord, I cannot bring myself to accuse the company of so much as the intention to injure me. That company owes its birth to me. For them I have sacrificed everything, even my property and my credit, being now bankrupt, not only in France, but also in all other countries. For them I have sacrificed the interests of my children, whom I tenderly love, and who are deserving of all my affections; these children, courted by the most considerable families in France, are now destitute of fortune and of establishments. I had it in my power to have settled my daughters in marriage in the first houses of Italy, Germany, and England; but I refused all offers of that nature, thinking it inconsistent with my duty to, and my affection for, the state in whose service I had the honour to be engaged. I do not assume to myself any merit from this conduct, and I never so much as spoke upon the subject to the regent. But I cannot help observing that this mode of behaviour is diametrically opposite to the idea my enemies wish to impute to me; and surely all Europe ought to have a good opinion of my disinterestedness, and of the condition to which I am reduced, since I no longer receive any proposals of marriage for my children.

"My lord, I conducted myself with a still greater degree of delicacy: for I took care not to have my son or my daughter married even in France, although I had the most splendid and advantageous offers of that kind. I did not choose that any part of my protection should be owing to alliances; but that it should depend solely upon the intrinsic merits of my project."

These representations failed to produce the desired effect; the India Company refused to allow him credit for the notes and actions in their hands belonging to him, while they at the same time insisted on his making payment in specie of the sums owing to them; the government with equal injustice confiscated his whole property in France. In 1725 Mr. Law bade a final adieu to Britain, and retired to Venice, where he died in a state little removed from indigence, on the 21st of March, 1729, in the fifty-eighth year of his age. He lies buried in one of the churches of the city, where a monument to his memory is still to be seen.

Such is a brief outline of the history of one of the most extraordinary projectors of modern times. That he deceived himself is, we think, quite evident from the whole tenor of his conduct; that he should have deceived others is not wonderful, if we consider the spirit and circumstances of the times in which he lived, the ignorance of the public mind respecting the great principles of credit and currency, and the personal advantages and experience which the master-projector possessed. He is said to have presented an uncommonly engaging external appearance. "*On peut,*" says the French historian of his system, "*sans flatterie, le mettre au rang des hommes les mieux faits.*" In Brunley's *Catalogue of British Portraits* four engravings of Law are noticed, by Anglois, Hubert, Des Rochers, and Schmidt. The best portrait of him was a crayon portrait by Rosalba in the Earl of Oxford's gallery. Of his moral character we have already spoken. Lockhart of Carnwath relates that, even before he left Scotland, he was "nicely expert in all manner of debaucheries."

Law never composed any treatise; his works are confined to memorials and justificatory statements, or explanations of his views and plans. Towards

the end of the year 1790, the epoch of the creation of the assignats, there appeared at Paris an octavo volume, entitled *Œuvres de J. Law, Contrôleur-général des Finances de France sous le Régent*. This work was ably edited by M. Senour, and is in high estimation in France. The writings relating to Law's system are very numerous; Stewart, Ganihl, and Storch have all commented with ability upon his measures; and Duclos and Marmontel have composed very interesting memoirs of the projector and his system. In general, however, all the French writers of the eighteenth century have commented with great severity upon Law and his proceedings. Fourbonais was the first to do justice to this great but unfortunate man. Dutot, in his *Réflexions Politiques sur le Commerce et les Finances*, printed at the Hague in 1738, has discussed the state of affairs at the giving way of the system, and the effect of the famous edicts of the 5th March and 21st May, with great sagacity; Duverney's *Histoire du Système des Finances sous la Minorité de Louis XV., pendant les Années 1719 et 1720*, is a most valuable collection of edicts and state-papers relative to French finances, in two volumes. Mr. John Philip Wood's *Memoir of the Life of John Law of Lauriston*¹ is the best account which has yet been given to the British public of this extraordinary man, and the rise and fall of his fortunes.

Law married Lady Catharine Knollys, third daughter of Nicholas, third Earl of Banbury, by whom he had one son, John Law of Lauriston, and one daughter, Mary Catharine, who married her first cousin, William Viscount Wallingford, who was afterwards called to the House of Peers by the title of Baron Althorp. Lady Wallingford survived her husband more than half a century, and died in London on the 14th of October, 1790, leaving no issue. Her brother succeeded his father in 1729, and died a cornet of the regiment of Nassau Friesland, at Maestricht, in 1734. William Law, third son of Jean Campbell of Lauriston, succeeded to the entail on the extinction of the issue male of her eldest son. His eldest son John rose to the rank of commandant-general and president of council of the French settlement in India, and died at Paris about 1796; and on the 21st of May, 1808, Francis John William Law, a merchant in London, of the reformed religion, was served nearest and legitimate heir of entail and provision of his father John Law, and entered into the possession of the estate of Lauriston, to the exclusion of his elder brothers, who were Roman Catholics. Law's grandson, Count de Lauriston, was one of the generals of Napoleon Bonaparte.

LEE, REV. DR. JOHN. This venerable clergyman, who filled so many high offices in our literary institutions and the church, and left behind him so high a reputation in ecclesiastical antiquarianism, was the son of parents in humble life, and born at Torwoodlee Mains, parish of Stow, on the Gala Water. Being intended for the medical profession, he was some time under the celebrated Dr. Leyden, and afterwards studied in the university of Edinburgh, where he took the degree of M.A. The Czar of Russia having resolved to establish a university at Wilna, in Russian Poland, its chair of moral philosophy was offered to Mr. Lee; but, perhaps fortunately for him, a change of the political relations between Russia and Great Britain prevented his appointment. Having finished his medical studies at Edinburgh, and graduated as M.D., he obtained an

appointment in the hospital department of the army, but did not hold it long, as he had now directed his views to the clerical profession; in consequence of which he returned to college, attended the usual courses of theology, and was licensed to preach by the presbytery of Edinburgh in 1807. His first clerical charge was one of the Scottish chapels in London in connection with the Church of Scotland; but in 1808 he was presented to the parish of Peebles, of which he became minister, and where, during a stay of four years, his rising talents began to bring him into notice. In 1812 he was appointed professor of church-history in the university of St. Andrews, by the crown, to which the patronage of the chair belongs, and from this he was transferred to the professorship of moral philosophy in King's College, Old Aberdeen, which charge he filled during the session of 1820-1. After this short stay in Aberdeen he was presented by the crown to the first charge of the Canongate Church, Edinburgh, where he had for his colleague the venerable Dr. Buchanan.

While he held this charge in the Canongate, Dr. Lee engaged in a bold and difficult enterprise, which will endear his memory to Scotland and the Christian world at large. It was the emancipation of the Scriptures from the monopoly of the royal printers. A single company enjoyed this privilege in Scotland, and the consequence of such restriction was that the price at which Bibles were sold weighed heavily upon the poor. Aware of this evil, Dr. Lee commenced an agitation for a free and cheap circulation of the Scriptures; and he was leader of the party who held that no British sovereign had the right to trammel the publication of the Bible, or confine its printing to any privileged company whatever. He also, with much trouble and expense, collected materials for several tratises which he wrote upon the subject—and the result was, that after a litigation of several years, this exclusive right of printing the Bible was abrogated. Having now become a person of some note and influence, he was in 1824 appointed one of the commissioners for inquiring into the state of the universities of Scotland, on which occasion he drew up the report on the university of Glasgow; and in the same year he was presented to the church and parish of Lady Yester's, Edinburgh. An appointment still more important to the Church of Scotland followed in 1827, when he was elected clerk of the General Assembly. It may be averred, that from his profound knowledge of the history of the church and its forms, no one was so well qualified for such a responsible situation; and in every doubtful question, when such subjects were at issue, his memory could readily produce those precedents by which all cavil or uncertainty was terminated. Another office which he admirably discharged, as clerk of the assembly, was to draw up the pastoral addresses in the name of the church to its several congregations; and these were pervaded with such apostolic simplicity and unction, that they continued to be remembered after the living voice of their writer had ceased to be heard. In the meantime, the various promotions of Dr. Lee were still going on, and with almost unexampled rapidity. In 1830 he was appointed one of the royal chaplains for Scotland. In 1835 he was inducted to the collegiate charge of the Old Church, Edinburgh, as successor to Dr. Brown, and colleague of Dr. Macknight; and in 1837 he received from the crown the appointment of principal of the united colleges of St. Salvador and St. Leonard, St. Andrews, which charge, however, he held only for a single session. In 1839 he was appointed principal of the university of St. Andrews, and in 1840 he was elected principal of

¹ Edinburgh, 1824, 12mo, pp. 234.

the university of Edinburgh by the town-council, who were its patrons. As an ecclesiastic he could rise no higher; and, resigning his charge in the Old Church, he continued in the principalship to the end of his days. Several offices, however, chiefly honorary, were added to it. In 1841 he was appointed one of the deans of the chapel royal; in 1843, the memorable year of the disruption, in consequence of the retirement of Dr. Chalmers from the Establishment, he was appointed professor of divinity in the university of Edinburgh, which charge he held along with that of principal; and in 1844 he was chosen moderator of the General Assembly. He was doctor of every faculty except that of music, being M.D., D.D., and LL.D., but of the three last titles he had shown himself every way worthy, by his profound erudition, his varied attainments, and his manifold services as minister, clerk of assembly, professor, and principal.

From the extensive scholarship of Dr. Lee, and especially his profound and accurate knowledge in Scottish antiquarianism, it was expected that some great work commensurate with such attainments would have proceeded from his pen to endure as an evidence of his worth. Such was the yearly expectation of his friends, and it was encouraged by his avowed purpose to attempt such an undertaking. But it was never fulfilled. It may be that the nervous irresolution to make a beginning which sometimes besets even the highly intellectual, and persuades them to pause until the opportunity has gone for ever—or the rapid series of changes through which he passed, that kept his sandals continually girt and the pilgrim's staff in his hand—disinclined him to such an attempt, even when the season was favourable. As it was, his productions were chiefly pamphlets for the hour and the occasion, and his *Lectures on the History of the Church of Scotland from the Reformation to the Revolution*, which were published after his death by his son, the Rev. William Lee. After a short illness the principal died at his residence in the college of Edinburgh, on the 2d of May, 1859, having reached the seventy-ninth year of his age.

LEIGHTON, ROBERT, an ecclesiastic of singular learning, integrity, and benevolence, was born in 1611, and descended from an ancient and respectable family, who were long in possession of the estate called Ulyshaven, in Forfarshire. Their names are mentioned in several parts of history, and even so far back as *Doomsday Book*. In 1424 Dr. Henry Leighton, Bishop of Moray, and afterwards of Aberdeen, was deputed as one of the commissioners to negotiate for the release of James I., at that time a prisoner in England. The family estate of Ulyshaven was lost to the house of Leighton in the seventeenth century, as they had by that time decayed in wealth and interest.

Dr. Alexander Leighton, father of the subject of this memoir, was educated at St. Andrews, where he obtained the degree of Doctor of Divinity. He afterwards went to Leyden, and applied himself to the study of physic, and so far succeeded as to graduate there. The Scottish church at Utrecht being in want of a minister, and he being, according to all accounts, a man of great piety and learning, the charge was offered to him, which he accepted, and he continued to officiate there for some time; but not approving of the holidays observed by the Dutch church, and having some difference on the subject, he finally resigned. He was there styled Doctor of Medicine and Scottish minister. We shall compress, in the shortest limits possible, the most pro-

minent actions of this man's eventful life, as his name is conspicuous in history from the cruel persecution which he suffered.

On his arrival in London from Holland he saw with grief and indignation that the Presbyterian church, of which he was a stern defender, was likely to be subverted in Scotland, through the policy of Charles I. and his ministers—and being a man, according to Burnet, “of much untempered zeal,” and fond of polemics, he published several tracts against Episcopacy, which gave great offence to the members of that persuasion. He at this time intended to commence the medical profession in London; but the College of Physicians interdicted him from practice within seven miles of the city, as a person they considered disgraceful to their profession; an allegation he disputed and disproved, by claiming a right, in virtue of his having graduated in the college of Leyden. They did not deny his being a clergyman; but at that time he had no living. He soon after this drew down upon himself the vengeance of that tyrannical and unconstitutional court, the Star-chamber. The work for which he was prosecuted, according to Burnet, is entitled *Zion's Plea against Prelates*; the name of the author and printer were omitted, and instead of the date of publication, the following words were added—“Printed the year and month wherein Rochelle was lost,”—evidently intended as a stigma for that city being allowed to be taken by the French Catholics from the Protestants in 1628; an event which it was well known Charles might have prevented, if he had had the interests of Protestantism really at heart. There was also prefixed to this work—which it appears was printed in Holland—a hieroglyphical vignette, seemingly designed to recommend the subversion of Prelacy. This is described in the informations by Rushworth, “as a most seditious scandal upon the king, state, and kingdom, wickedly affirming that all that pass us spoil us, and we spoil all that rely upon us, and amongst the rest the black pining death of the famished Rochelles, to the number of 15,000 in four months; by which passages he did, so much as in him lay, scandal his majesty's person, his religious wife, and just government, especially the reverend bishops.” Soon after this offensive work was put into circulation Dr. Leighton was arrested by a warrant from the high-commission court, and committed to Newgate, where he was confined for fifteen weeks in a loathsome cell full of vermin, without a bed to rest upon, and openly exposed to the inclemency of the weather: none of his family or friends were permitted to see him; and in the meantime his house was forcibly entered, and not only his books and papers, but every article of furniture, carried away.

The cause was tried on the 4th of June, 1630. The defendant, in his answer, owned the writing of the book, but denied all intention of evil, his end being only to remonstrate against certain grievances in church and state, under which the people suffered, to the end that parliament might take them into consideration, and give such redress as might be for the honour of the king, the quiet of the people, and the peace of the church. Nevertheless, the court adjudged unanimously, that for this offence the doctor “should be committed to the prison of the Fleet for life, and pay a fine of £10,000; that the high-commission should degrade him from his ministry, and that then he should be brought to the pillory at Westminster, while the court was sitting, and be whipped; after whipping, be set in the pillory a convenient time, and have one of his ears cut off, and one side of his nose slit, and be branded in the face with a double S. S., for *sewer of sedition*; that then

he should be carried back to prison, and after a few days be pilloried a second time in Cheapside, and be there likewise whipped, and have the other side of his nose slit, and his other ear cut off, and then be shut up in close prison for the remainder of his life;" a sentence only to be compared with the worst acts of the infernal inquisition of Spain. Archbishop Laud, on hearing the unfortunate man condemned, pulled off his hat, and holding up his hands, gave thanks to God who had given him the victory over his enemies. This barbarous sentence being given towards the end of Trinity term, and the court not usually sitting after the term unless upon emergent occasions, and it requiring some time in the ecclesiastical court in order to the degradation of the defendant, it was Michaelmas following before any part of the sentence could be put in execution. On the 10th of November he was to have undergone the punishment awarded to him; however, the night before he contrived, with the assistance of one Livingston and Anderson, to effect his escape. A hue and cry was immediately issued by order of the privy-council, ordering his apprehension, which described him as a man of low stature, fair complexion, high forehead, and yellowish beard, about forty or fifty years of age. He scarcely was at large one week when he was seized in Bedfordshire, and brought back to the Fleet. Rushworth, in his *Historical Collections*, says, "On Friday, the 16th of November, part of the sentence on Dr. Leighton was executed upon him in this manner, in the new palace at Westminster. He was severely whipped before he was put in the pillory. Being set in the pillory, he had one of his ears cut off, one side of his nose slit, was branded on the cheek with a red-hot iron with the letters S. S., *sower of sedition*, and afterwards carried back again prisoner to the Fleet, to be kept in close custody. And on that day seven-night, his sores upon his back, ear, nose, and face not being cured, he was whipped again at the pillory in Cheapside, and there had the remainder of his sentence executed upon him, by cutting off the other ear, slitting the other side of the nose, and branding the other cheek." His unfortunate companions who aided him to escape were also brought before the Star-chamber, and out of respect to their "penitency" they were only fined £500 each, and committed to the Fleet during the king's pleasure.

In that vile prison, in a filthy, dark, and unwholesome dungeon, the unhappy Leighton was incarcerated for upwards of eleven years, without once being suffered to breathe in the open air; and when at length released from his miserable confinement, he could neither walk, see, nor hear. His release was only effected when the sitting of the long parliament had changed the state of things in England. "At the reading of his petition in the House of Commons," says Brook, "giving an account of the dreadful barbarity with which he had been treated, the members were so deeply moved and affected, that they could not bear to hear it without several interruptions with floods of tears." A committee was appointed to investigate his case, and the result was, as might be expected, the exposure of one of the most unconstitutional and horrible pieces of barbarity that ever stained a nation's annals. The whole proceedings were declared illegal, and reversed, and "good satisfaction and reparation were ordered to be made to him for his great sufferings and damages." Six thousand pounds were voted on his account; but it is very uncertain in those distracted times if he ever received it.

In 1642 Lambeth House was converted into a prison, and he was made keeper of it, on account,

it is said, of his knowledge of the medical profession. He did not survive this unworthy appointment long, and the wonder only is, how human nature could have borne up against such dreadful inflictions as he had endured.

ROBERT LEIGHTON, some time Bishop of Dunblane, and afterwards Archbishop of Glasgow, son to Alexander, and the proper subject of this memoir, was, according to Pearson in a late edition of his works, born in Edinburgh, and received his education at that university, which he entered as a student in 1627. From his earliest years he was conspicuous for exemplary piety and a humble disposition; with talents of the rarest description, and a happy facility of acquiring a knowledge of languages. He was, above all, fond of studying the Scriptures, and was profoundly skilled in every branch of theological learning. Two of the masters at that time in the university whose classes he attended, namely Robert Rankin, professor of philosophy, and James Fairley, professor of divinity, were strongly in favour of Episcopacy; the latter having afterwards become Bishop of Argyle. It is more than probable that their opinions, being early imbibed by Leighton, continued in after-life to exercise a considerable influence over him. This may in a great degree serve to explain why he seceded from the Presbyterian church. He became Master of Arts in 1631, and having by that time completed his course of academical studies, he was sent abroad for further improvement, and took up his residence at Douay in France, where some of his relations lived. There he formed an intimacy with many of the best educated of the Roman Catholic gentlemen who were attending the college, and being naturally fond of exploring every system of ecclesiastical polity, where he found men of worth adhering to forms of religion even at variance with his own, he loved them in Christian charity for the virtue they possessed, and thought less rigidly of their doctrine. While in France he acquired a perfect knowledge of the language, which he spoke with all the fluency of the most polished native. It is impossible to ascertain how he passed the intermediate ten years from the time he went to Douay. All we can gather with certainty is, that in 1641, on his return from the Continent, and immediately after the triumph of Presbytery in Scotland, he was, at the age of thirty, and in the very year of his father's liberation from his cruel confinement, settled as Presbyterian minister in the parish of Newbattle, in the county of Edinburgh. There he was most unremitting in the sacred duties of his office, preaching peace and good-will amongst all men, carefully avoiding to mix or interfere with the distractions of that stormy period, when the pulpit was made the vehicle of political disputes. It being the custom of the presbytery to inquire of the brethren twice a year, whether they had preached to the *times*: "For God's sake," answered Leighton, "when all my brethren preach to the *times*, suffer one poor priest to preach for *eternity*." This moderation could not fail to give offence;—the fact is, he seems to have regarded their disputes as trivial in comparison with the high and sacred duties he felt himself called upon to perform in his holy office. He seldom or never attended the meetings of the presbytery, which was undoubtedly part of his duty as a Presbyterian minister, but chose rather to live in strict retirement, alive only to the care of his own parish, in which he proved himself a faithful and zealous pastor. Of all the accounts of this eminent divine there is none so strictly correct as that left on record by his friend and illustrious contemporary, Bishop Burnet, which we shall here quote in full, as we are

persuaded that nothing could be given either so entertaining or so full of information.

"Robert, eldest son of Dr. Leighton, was bred in Scotland, and was accounted a saint from his youth up. He had great quickness of parts, a lively apprehension, with a charming vivacity of thought and expression. He had the greatest command of the purest Latin I ever knew in any man; he was master of both Greek and Hebrew, and of the whole compass of theological learning, chiefly in the study of the Scriptures. But that which excelled all the rest was, he was possessed with the highest and boldest sense of divine things that I ever saw in any man; he had no regard for his person, unless it was to mortify it by a constant low diet, that was like a perpetual fast. He had both a contempt of wealth and reputation: he seemed to have the lowest thoughts of himself possible, and to desire that all other persons should think as meanly of him as he did himself. He bore all sorts of ill usage and reproach like a man that took pleasure in it. He had so subdued the natural heat of his temper that in a great variety of accidents, and in the course of twenty years of intimate conversation with him, I never observed the least sign of passion but upon one single occasion. He brought himself into so composed a gravity that I never saw him laugh, and but seldom smile; and he kept himself in such a constant recollection, that I do not remember that I ever heard him say one idle word. There was a visible tendency in all he said to raise his own mind, and those he conversed with, to serious reflections. He seemed to be in a perpetual meditation; and, though the whole course of his life was strict and ascetical, yet he had nothing of the sourness of temper that generally possesses men of that sort. He was the freest from superstition, of censuring others, or of imposing his own methods on them, possible; so that he did not so much as recommend them to others. He said there was a diversity of tempers, and every man was to watch over his own, and to turn it in the best manner he could. His thoughts were lively, oft out of the way and surprising, yet just and genuine. And he had laid together, in his memory, the greatest treasure of the best and wisest of all the ancient sayings of the heathens as well as Christians, that I have ever known any man master of, and he used them in the adapest manner possible. He had been bred up with the greatest aversion possible to the whole frame of the Church of England. From Scotland his father sent him to travel. He spent some years in France, and spoke the language like one born there. He came afterwards and settled in Scotland, and had the Presbyterian ordination; but he quickly bore through the prejudices of his education. His preaching had a sublimity both of thought and expression in it. The grace and gravity of his pronunciation was such, that few heard him without a very sensible emotion; I am sure I never did. His style was rather too fine; but there was a majesty and beauty in it that left so deep an impression, that I cannot yet forget the sermons I heard him preach thirty years ago; and yet with this he seemed to look on himself as so ordinary a preacher, that while he had the cure, he was ready to employ all others, and when he was a bishop he chose to preach to small auditories, and would never give notice beforehand. He had indeed a very low voice, and so could not be heard by a great crowd. He soon came to see into the follies of the Presbyterians, and to dislike their covenant, particularly their imposing it, and their fury against all who differed from them. He found they were not capable of large thoughts; theirs were narrow as their tempers were

sour; so he grew weary of mixing with them. He scarce ever went to their meetings, and lived in great retirement, minding only the care of his own parish at Newbattle, near Edinburgh. Yet all the opposition that he made to them was, that he preached up a more exact rule of life than seemed to them consistent with human nature; but his own practice did outshine his doctrine.

"In the year 1648 he declared himself for the engagement for the king. But the Earl of Lothian, who lived in his parish, had so high an esteem for him, that he persuaded the violent men not to meddle with him, though he gave occasion to great exception; for when some of his parish who had been in the engagement were ordered to make public profession of their repentance for it, he told them they had been in an expedition in which he believed they had neglected their duty to God, and had been guilty of injustice and violence, of drunkenness, and other immoralities, and he charged them to repent of these seriously, without meddling with the quarrel or the grounds of that war. He entered into a great correspondence with many of the Episcopal party, and with my own father in particular, and did wholly separate himself from the Presbyterians. At last he left them and withdrew from his cure, for he could not do the things imposed on him any longer. And yet he hated all contention so much that he chose rather to leave them in a silent manner, than to engage in any disputes with them. But he had generally the reputation of a saint and of something above human nature in him; so the mastership of the Edinburgh College falling vacant some time after, and it being in the gift of the city, he was prevailed on to accept it, because in it he was wholly separated from all church matters. He continued ten years in that post, and was a great blessing in it; for he talked so to all the youth of any capacity or distinction, that it had a great effect upon them. He preached often to them, and if crowds broke in, which they were apt to do, he would have gone on in his sermon in Latin, with a purity and life that charmed all who understood it. Thus he had lived above twenty years in Scotland, in the highest reputation that any man in my time ever had in the kingdom. He had a brother well known at court, Sir Elisha, who was very like him in face and in the vivacity of his parts; but the most unlike him in all other things that can be imagined. For though he loved to talk of great sublimities in religion, yet he was a very immoral man. He was a Papist of a form of his own; but he had changed his religion to raise himself at court, for he was at that time secretary to the Duke of York, and was very intimate with Lord Aubigny, a brother of the Duke of Richmond's, who had changed his religion, and was a priest, and had probably been a cardinal if he had lived longer. He maintained an outward decency, and had more learning and better notions than men of quality who enter into the church generally have. Yet he was a very vicious man; and that perhaps made him the more considered by the king [Charles II.], who loved and trusted him to a high degree. No man had more credit with the king; for he was in the secret as to his religion, and was more trusted with the whole designs that were then managed in order to establish it, than any man whatsoever. Sir Elisha brought his brother and him acquainted; for Leighton loved to know men in all the varieties of religion. In the vacation time he made excursions and came often to London, where he observed all the eminent men in Cromwell's court, and in the several parties then about the city of London; but he told me that they were men of unquiet and meddling tempers;

and that their discourses were very dry and unsavoury, full of airy cant or of bombast swellings. Sometimes he went over to Flanders to see what he could find in the several orders of the Church of Rome. There he found some of Jansenius' followers, who seemed to be men of extraordinary tempers, and studied to bring things, if possible, to the purity and simplicity of the primitive ages; on which all his thoughts were much set. He thought controversies had been too much insisted upon, and had been carried too far. His brother, who thought of nothing but the raising himself at court, fancied that his being made a bishop might render himself more considerable; so he possessed Lord Aubigny with such an opinion of him, that he made the king apprehend that a man of his piety and his notions (and his not being married was not forgot) might contribute to carry on their designs. He fancied such a monastic man, who had a great stretch of thought and so many other eminent qualities, would be a mean at least to prepare the nation for Popery, if he did not directly come over to them, for his brother did not stick to say he was sure that lay at the root with him. So the king named him of his own proper motion, which gave all those who began to suspect the king himself great jealousies of him. Leighton was averse to this promotion as much as possible. His brother had great power over him, for he took care to hide his vices from him, and to make before him a show of piety. He seemed to be a Papist rather in name and show than in reality, of which I will set down one instance that was then much talked of. Some of the Church of England loved to magnify the sacrament in an extraordinary manner, affirming the real presence, only blaming the Church of Rome for defining the manner of it, saying Christ was present in the most inconceivable manner. This was so much the mode that the king and all the court went into it; so the king, upon some railery about transubstantiation, asked Sir Elisha if he believed it. He answered he could not well tell, but he was sure the Church of England believed it; and when the king seemed amazed at that, he replied, Do you not believe that Christ is present in the most inconceivable manner—which the king granted. Then said he, That is just transubstantiation, the most inconceivable thing that was ever yet invented. When Leighton was prevailed upon to accept a bishopric, he chose Dumblane, a small diocese as well as a little revenue. But the deanery of the chapel-royal was annexed to that see. So he was willing to engage in that, that he might set up the common prayer in the king's chapel, for the rebuilding of which orders were given. The English clergy were well pleased with him, finding him both more learned and more thoroughly versed in the other points of uniformity than the rest of the Scottish clergy, whom they could not much value; and though Sheldon did not much like his great strictness, in which he had no mind to imitate him, yet he thought such a man as he was might give credit to Episcopacy, in its first introduction to a nation much prejudiced against it. Sharpe did not know what to make of all this. He neither liked his strictness of life nor his notions. He believed they would not take the same methods, and fancied he might be much obscured by him, for he saw he would be well supported. He saw the Earl of Lauderdale began to magnify him, and so Sharpe did all he could to discourage him, but without any effect, for he had no regard to him. I bear still the greatest veneration for the memory of that man that I do for any person, and reckon my early knowledge of him, which happened the year after this, and my long

and intimate conversation with him, that continued to his death, for twenty-three years, among the greatest blessings of my life, and for which I know I must give an account to God in the great day, in a most particular manner; and yet, though I know this account of his promotion may seem a blemish upon him, I would not conceal it, being resolved to write of all persons and things with all possible candour. I had the relation of it from himself, and more particularly from his brother. But what hopes soever the Papists had of him at this time, when he knew nothing of the design of bringing in Popery, and had therefore talked of some points of Popery with the freedom of an abstracted or speculative man; yet he expressed another sense of the matter when he came to see it was really to be brought in amongst us. He then spoke of Popery in the complex at much another rate; and he seemed to have more zeal against it than I thought was in his nature with relation to any points in controversy, for his abstraction made him seem cold in all these matters. But he gave all who conversed with him a very different view of Popery, when he saw we were really in danger of coming under the power of a religion that had, as he used to say, much of the wisdom that was earthly, sensual, and devilish; but had nothing in it of the wisdom that is from above, and is pure and peaceable. He did indeed think the corruptions and cruelties of Popery were such gross and odious things, that nothing could have maintained that church under those just and visible prejudices but the several orders among them, which had an appearance of mortification and contempt of the world, and with all the work that was among them, maintained a face of piety and devotion. He also thought the great and fatal error of the Reformation was, that more of those houses, and that course of life free from the entanglements of vows and other mixtures, was not preserved; so that the Protestant churches had neither places of education, nor retreat for men of mortified tempers. I have dwelt long upon this man's character, but it was so singular that it seemed to deserve it; and I was so singularly blessed by knowing him as I did, that I am sure he deserved it of me, that I should give so full a view of him, which I hope may be of some use to the world."

Leighton remained ten years principal of the college of Edinburgh, where he conducted himself with a degree of diligence, wisdom, and prudence, that engaged universal respect and esteem, and proved of essential benefit to the students. The funds of that seminary were then very low, and Leighton did not scruple to go to London to appeal to the generosity of Cromwell in favour of his object. That extraordinary man ordered an annuity of £200 a year to be granted in 1658, a sum that at the time was of considerable use; but on the death of the Protector, which took place shortly after, it fell to the ground, as all his acts were rescinded at the Restoration. The state of the Presbyterian church in Scotland when Charles II. ascended the throne was extremely critical—betrayed by its own ministers, and secretly hated by the king, who had sworn to defend its rights. James Sharpe, who was commissioned to go to London to defend the rights of the Scottish church, was a man capable of any duplicity or baseness that would in the main advance his own interests, while his communications with his brethren at home were lying and deceitful. He had the effrontery to impress on the minds of the court that the people of Scotland were at heart unfriendly to Presbytery, and secretly attached to Episcopacy. However Charles may have doubted the truth of

such an account, he was glad to avail himself of Sharpe's duplicity to give ascendancy to Prelacy; and notwithstanding the memorials and remonstrances from the Scottish church, and the interference of men of rank and importance, he determined on the re-establishment of a hierarchy in Scotland.

Sharpe, as a reward for his perfidious apostasy, was to be elevated to the primacy. He had the recommendation also of other persons to fill the different vacant sees; but Leighton was the last man he would ever have thought of pointing out, as he shrunk from approaching a character so upright and virtuous, in every way superior to himself. But Sir Elisha Leighton, already referred to by Burnet, having an-eye to his own interests, considered that by having a brother, over whom he had already gained some ascendancy, high in the church, much might be expected. As he affected to be strongly attached to Popery to please the Duke of York, whose secretary he was, he vainly thought, as his relative was on many occasions known to evince a great respect for some good men connected with the Church of Rome, that in time he might be gained over to promote and adopt that faith. Blinded by selfish ambition, he was incapable of perceiving, like the illustrious Burnet, that of all men Leighton was the least likely to favour a religion which he characterized as "earthly, sensual, and devilish, with nothing in it of the wisdom that was from above, and was pure and peaceable." Indeed it was a matter of considerable difficulty, as it will appear, to prevail upon him to join the Episcopalians. The king, though pleased at finding Sharpe and others subservient in all points to his wishes, still knew that their characters must stand degraded in the eyes of the people, as they were men neither of piety nor moderation, and that it would be, above all, necessary to strengthen their ranks by those who stood high and worthy in the eyes of the world; for this reason he personally solicited Leighton to accept of a mitre. The Earl of Lauderdale and his brother, and some of the most moderate and respectable of his countrymen, exerted themselves to gain the same result, but all seemed of no avail. Leighton still refused, as he evidently mistrusted the men to whom the government of the new church was to be confided, and he could not but see that the methods they resorted to were violent and repugnant to the principles and desires of the people of Scotland. "It was at last mentioned to him that the king had issued positive orders for him to yield, unless in fact he regarded the episcopal office as unwarrantable." To that extreme he would not go, as he all along was favourable to that order, if divested of its useless pomp.

He was at length persuaded that a regard to the interests of the church rendered it his duty to accept it; but in order to demonstrate to the world that avarice was not his principle, he made choice of Dumblane, as of small extent and little revenue. He was consecrated, along with Sharpe and two other Scottish bishops, at the Abbey Church of Westminster, which occasion was celebrated with great feasting and pomp. Leighton could not help remarking, "that it had not such an appearance of seriousness or piety as became the new modelling of a church." It is with considerable hesitation we are obliged to remark, that in this instance the conduct of Leighton exhibits a want of the Christian consistency and simplicity generally displayed in his character. Admitting that his reason for joining the Episcopal church was the virtuous intention of softening down the asperities of two rival systems which had long struggled for ascendancy, yet the time was unseasonable, when selfish and bad men were endeavouring by all crooked means to build

their fortunes on the ruin of their country and their shameful apostasy. He was induced, too, to lend the weight of his virtuous name in countenancing the acts of a reckless and unprincipled tyrant, bent on the total subversion of those forms of religion connected with his earliest associations, and in whose defence his father had almost suffered martyrdom. That he was free from all interested motives every one must admit; and in justice to his character we shall quote from Pearson (p. 43) the following extract of a letter written by him in reference to his appointment:—"There is in this preferment something that would allow of reconciling the devout on different sides, and of enlarging those good souls you meet with from their little fetters, though possibly with little success. Yet the design is commendable—pardonable at least. However, one comfort I have, that in what is pressed on me there is the least of my own choice; yea, on the contrary, the strongest aversion that I ever had to anything in all my life; the difficulty, in short, lies in a necessity of either owning a scruple which I have not, or the rudest disobedience to the authority that may be. The truth is, I am yet importuning and struggling for a liberation, and look upward for it; but whatever be the issue, I look beyond it and this weary, wretched world, through which the hand I have resigned to, I trust, will lead me into the path of his own choosing: and, so I may please him, I am satisfied. I hope if ever we meet, you shall find me in the love of solitude and a devout life."

He lost no time in endeavouring to persuade Sharpe to join with him in some moderate plan, founded on Archbishop Usher's scheme for uniting the Presbyterians and Episcopalians, but to his astonishment he found him unwilling even to talk on the subject. He and the other newly made bishops seemed only anxious to get possession of their sees. This circumstance was discouraging to Leighton, who soon perceived that such men were not designed by Providence to build up the church. Soon after their consecration the Scottish bishops went down to Scotland in one coach; but when they came to Morpeth, finding that they intended to be received at Edinburgh with pomp and ostentation, Leighton parted company from them, and arrived at the capital some days before them. He would not even have the title of lord given to him by his friends, and was not easy when others used it in addressing him. Leighton soon perceived with deep regret that the government was resolved to enforce conformity on the Presbyterians by severe means. He laboured all in his power to show the impolicy of such proceedings, and in the session of parliament in April, 1662, when the ministers to whom the oath of allegiance and supremacy was tendered, consented to take it with an explanation, which they presented to the house, he pleaded strenuously that it might be accepted, and insisted that the conditions asked by the Presbyterians were just, and should in reason be granted. Sharpe with his usual vehemence answered that it was below the dignity of government to make acts to satisfy the scruples of peevish men, and "that it ill became those who had imposed their covenant on all people, without any explication, and had forced all to take it, now to expect such extraordinary favours." "For that very reason," replied Leighton, "it ought to be done, that all people may see the difference between the mild proceedings of the government and their rivals; and that it ill became the very same persons who had complained of that, now to practise it themselves, for thus, it may be said, the world goes mad at times." But the voice of violence prevailed. The Scottish bishops were

entitled to a seat in parliament on their consecration, and were one and all invited to avail themselves of the privilege. Leighton was the only one that declined the honour. He retired to his see, and resolved never to appear in parliament unless the interests of religion were called in question, or by his presence he might assist it. In his own diocese he set a bright example to his brethren by practising the moderation which he recommended. He studied to make his clergymen a well-informed, serious, and useful body of men; and he even tolerated the preaching of non-conforming ministers in districts where the people were particularly attached to them. He continued a private and ascetic course of life, and gave all his income, except the little he expended on his own person, to the poor. By these means he became generally beloved through his diocese, and even softened down the feelings of those who were most adverse to Episcopacy.

In the year 1665 the proceedings in Scotland by the ecclesiastical high-commission were so severe and illegal, that Leighton was prevailed on to go to court and lay before the king a true account of them. On this occasion he assured his majesty that the measures which Sharpe and other members of the court pursued were so violent, "that he could not concur in planting of the Christian religion itself in such a manner, much less a form of government. He therefore entreated leave to quit his bishopric, and to retire, for he thought he was in some sort accessory to the violence of others." The king seemed to be deeply affected with the complaints of the worthy prelate, and issued an order in council for discontinuing the ecclesiastical commission, and less rigorous measures were promised to be pursued with respect to Scotland; but the king would not hear of Leighton's resigning his see. Deceived by the specious conduct of Charles on this interview, and perhaps aware that if he retired he would lose all authority or chance of standing between the people of Scotland and persecution, he returned to his see, and resumed the charge of his sacred functions. It is almost needless to add that no reliance could be placed on the promise of protection from so deceitful a monarch. Matters in Scotland were driven to such dreadful extremities by the base and tyrannical authorities, that it was impossible to bear up much longer against them.

In 1667 Leighton was once more prevailed on to go to London, where he laid before the king the outrageous conduct of the former administrations of church affairs, and implored him to adopt more moderate counsels; in particular he proposed a comprehension of the Presbyterian party, by altering the terms of the laws a little, and by such abatements as might preserve the whole for the future by giving a little for the present. This audience had the good effect of inducing the king to write a letter to the privy-council, ordering them to indulge such of the Presbyterians as were moderate and loyal, so far as to suffer them to serve in vacant churches, though they did not submit to the ecclesiastical establishment. This small indulgence enraged the Episcopal party in Scotland; they thought it illegal and fatal to the interests of the church, and directed an address to be drawn up expressive of their sentiments, though they did not venture to present it. A copy, however, was privately sent up to the court, and drew down the king's resentment on the head of the Archbishop of Glasgow. When parliament assembled an act was obtained, a clause of which declared the settling of all things relating to the external government of the church to be the right of the crown. This clause, Leighton informed Burnet,

was surreptitiously inserted after the draught and form of the act was agreed upon, and was generally thought to be the work of Lauderdale. Such a fearful stretch of the prerogative alarmed both Episcopalians and Presbyterians; the former said it assimilated the king to a pope; the latter that it placed him in Christ's stead. The Archbishop of Glasgow thought it prudent immediately to resign his see, as he dreaded the coming storm, and knew he had no other chance of escaping its vengeance. Lauderdale and Lord Tweeddale fixed upon Leighton, and immediately offered to have him promoted to that high dignity; but though eagerly solicited by these noble lords, he respectfully declined the appointment. The king at last sent for him, and promised that he should be backed by the assistance of the court in his endeavours to accomplish his long-meditated and favourite scheme of a comprehension of the Presbyterians. He was at length persuaded to comply, and in 1670 he, without removing from Dumblane, undertook the administration of the see of Glasgow; nor was he at all willing to be consecrated archbishop until a year after. The plan of accommodation between the Episcopalians and Presbyterians, the particulars of which may be seen in Burnet's *History*, was, by the king's direction, limited to certain instructions, by which Lauderdale was empowered to embody the concessions that were to be offered into laws. Encouraged even by this support, Leighton had frequent conferences with some of the most eminent Presbyterian ministers, but in vain; he found it impossible to gain them over even to the most moderate form of Episcopacy. It is evident the Presbyterians mistrusted the overture in question, and looked upon it as a snare to lull their vigilance; and they had already too many deceitful examples in a former reign to think that the friends of Prelacy were now either more humane or honourable. The result of these negotiations grieved Leighton very much, while they delighted Sharpe and all of the same party, to whom everything like liberality or concession in favour of peace and religion was alike unknown or despised. They even went so far as to hint, in very intelligible terms, that under the mask of moderation he was secretly undermining their cause. Being thus unhappily situated, and despairing of being able to carry his great designs of healing the divisions and reforming the abuses in the church, he resolved to relinquish his see and retire into seclusion. He said "that his work seemed to be at an end, and that he had no more to do, unless he had a mind to please himself with the lazy enjoying of a good revenue." His friend Dr. Burnet endeavoured all in his power to make him give up this idea, but all to no purpose; the good man was resolute. He repaired to London, and after much difficulty obtained the king's reluctant consent to his resignation on condition that he would remain in office for another year. The court thought it possible in the interval that he might be gained over to remain and assist a cause fast falling into hatred and contempt by his pious and venerable name. He returned "much pleased with what he had obtained, and said to Dr. Burnet upon it, that there was now but one uneasy stage between him and rest, and he would wrestle through it the best he could." He continued to perform his duties with the same zeal as before, and at the end of the year 1673 he hastened to London and tendered his resignation, and was succeeded by the former possessor of the see, Dr. Alexander Burnet.¹ After residing for some time in the

¹ The following paper was left by Leighton for the purpose of explaining his reasons for resigning the see of Glasgow. It

college of Edinburgh, where he had long been principal, amongst a set of select friends, equally distinguished for their learning and piety, he removed to Broadhurst, an estate in Sussex belonging to his sister, Mrs. Lightwater, for whom he entertained the strongest affection. Here he lived ten years, occupied in study, meditation, and prayer, and doing all the good in his power. He distributed through the hands of other persons whatever he possessed beyond the means of subsistence—so unostentatious was he in his charity. He was in every instance through life most generous in pecuniary matters. When principal of the college of Edinburgh he presented the city with £150, the income of which was destined for the support of a student in philosophy. The college of Glasgow is also indebted to him for two bursaries, or for a sum the interest of which is to be appropriated to support two students. On the hospital of St. Nicholas, Glasgow, he bestowed £150, the proceeds of which were to be given to two poor men of good character. Three such persons are now enjoying the benefit of that sum, which yields £4, 10s. annually to each of them. This forms but a small specimen of the good works he performed during his long and valuable life.

Five years after he had retired from the business of active life, he was surprised and alarmed at receiving from his sovereign the following epistle:

“Windsor, July 16, 1679.

“MY LORD,—I am now resolved to try what clemency can prevail upon such in Scotland as will not conform to the government of the church there; for effecting of which design I desire you may go down to Scotland with your first conveyancy, and take all possible pains for persuading all you can of both opinions to as much mutual correspondence and concord as may be; and send me from time to time characters of both men and things. In order to this design I shall send you a precept for two hundred pounds sterling upon my exchequer till you resolve how to serve me in a stated employment. Your loving friend,

“CHARLES R.”

“For the Bishop of Dumblane.”

has been preserved in the university of Edinburgh, over which he so long and ably presided.

“Whatever others may judge, that know what past before my engaging in this charge, will not (I believe), impute my retreat from it from levity or unfixedness of mind, considering how often I declared before hand, both by word and write, the great suspicion I had that my continuance in it would be very short; neither is it from any sudden passion or sullen discontent that I have now resigned it; nor do I know any cause imaginable for any such thing, but the true reasons of my retiring are plainly and briefly these:

“1. The sense I have of the dreadful weight of whatsoever charge of souls, and all kinds of spiritual inspection over people; but much more over ministers; and withal of my own extreme unworthiness and unfitness for so high a station in the church; and there is an episcopal act that is above all the rest most formidable to me—the ordaining of ministers.

“2. The continuing and deeply increasing divisions and contentions and many other disorders of the church, and the little or no appearance of their cure for our time; and the little hope, amidst those contentions and disorders, of doing anything in this station to promote the great design of religion in the hearts and lives of men, which were the only worthy reasons of continuing in it, though it were with much pains and reluctance.

“3. The earnest desire I have long had of a retired and private life, which is now much increased by sickness and old age drawing on, and the sufficient experience I have of the folly and vanity of the world.

“To add any farther discourse, a large apology in this matter were to no purpose; but, instead of removing other mistakes and misconstructions, would be apt to expose me to one more, for it would look like too much valuing either of myself or of the world's opinion, both of which I think I have so much reason to despise.”—*Baxter's History of the University of Edinburgh*, vol. i. App. No. 6.

Leighton was now in his sixty-eighth year; and however flattering such a notice might be to a mind of an inferior grade, to his, which was exclusively bent on preparing for a heavenly kingdom, it gave only pain and apprehension. What were the vain disputes of angry men to him? besides, he could have little or no hopes in succeeding in the mission. He was saved however the trouble of trying the experiment, as the Duke of Monmouth, with whom the humane plan originated, fell into discredit, and the offer made to Leighton was never again renewed. This was the only serious interruption he met with in his retirement. Burnet saw him two years after, and says, “I was amazed to see him at above seventy look so fresh and well, that age seemed as it were to stand still with him. His hair was still black, and all his motions were lively; he had the same quickness of thought and strength of memory; but above all, the same heat and life of devotion that I had ever seen him in.” “When I took notice to him,” continues this celebrated writer, “upon my first seeing him how well he looked, he told me he was very near his end for all that, and his work and journey were now almost done. This at the time made no great impression on me. He was next day taken with an oppression, and it seemed with cold and with stitches, which was indeed a pleurisy.” This disease he foretold was doomed to be his last; he grew so suddenly ill, that speech and sense almost immediately left him; and in twelve hours after the first attack he breathed his last, without a struggle, in the arms of his long-revered and faithful friend Dr. Burnet, on the 26th June, 1684, at the advanced age of seventy-four. The place in which his pure spirit departed from its earthly tenement was an inn in Warwick Lane, London; and it is somewhat singular that he often used to say, that if he had the power to choose a place to breathe his last in, it would be an inn. “It looked,” he said, “like a pilgrim's going home, to whom this world was all an inn, and who was weary of the noise and confusion of it.” He thought, too, that the distress of friends and relations at the time of death was apt to withdraw the mind from serious thoughts; to keep it from being wholly directed to God. He bequeathed his books to the cathedral of Dumblane, and the residue of his limited fortune to his sister, Mrs. Lightwater, and her son, to be distributed as they thought fit to charitable purposes. After the character already given of him by his friend Burnet, it would be superfluous to add anything here.¹

His body was interred in the burial-ground of Horstead Heynes, in the parish which for ten years had been honoured by his residence. A simple inscription marks the spot where his remains are laid.² The family of his sister is now extinct, and the estate is in the hands of another. His brother Sir Elisha, it may be here stated, died a few months before him, and was interred in the same place.

LEITH, GENERAL SIR JAMES, G.C.B., a hero of the Peninsular war, was the third son of John Leith, Esq. of Leithwall, Aberdeenshire, where he

¹ The writings of Archbishop Leighton are thus enumerated in Watt's *Bibliotheca Britannica*:—“*Sermons*, London, 1692, 4to. *Prelectiones Theologicae*, 1693, 4to. *A Practical Commentary on the Two First Chapters of the First Epistle of St. Peter*, York, 1693, 2 vols. 4to; also in 2 vols. 8vo—an admirable commentary, which has been often reprinted. Three posthumous tracts; viz. *Rules for a Holy Life*; a *Sermon*; and a *Catechism*, London, 1708, 12mo.” The best edition of Leighton's whole works is that by Jarment, in 6 vols. 8vo, 1806.

² Depositu Roberti Leightounii, Archiepiscopi Glasguensis, apud Scotus, qui obiit xxv. die Junii anno Dni, 1684, ætatis suæ 74.

was born, on the 8th of August, 1763. He was educated first under a private tutor, and afterwards at the university of Aberdeen; and even in his boyish years was noted for an intrepidity and generosity of nature which gave promise of no common career. At Lisle he perfected himself in the studies suitable for a military life, and in 1780 entered the army, having been appointed to a second lieutenant's command in the 21st regiment, from which he was soon after raised to the rank of lieutenant and captain in the 81st Highland regiment. At the peace in 1783 he removed to the 5th regiment, then at Gibraltar, and was appointed aid-de-camp to Sir Robert Boyd, governor of the fort. Upon the appointment of General O'Hara to serve at Toulon, he was engaged in the defence of that station against the French republican army, as his aid-de-camp. He served Major-general David Dundas in a similar capacity, and upon the British forces being withdrawn from Toulon, he returned to England, being appointed major by brevet in 1794.

Major Leith raised a regiment of fencibles in Aberdeenshire, at the head of which he served in Ireland during the rebellion. He was there successively raised to the rank of colonel, brigadier-general, and major-general. He was next ordered to active service in the Peninsula. He joined the British army under Sir John Moore, being at first appointed to the command of the 26th and 81st regiments, which he afterwards exchanged for the brigade of the 51st, 59th, and 76th. Napoleon had now taken possession of Madrid, defeated the army of the Estremadura, and retiring to the north of Europe, left Marshals Soult and Ney to follow up the British army, which at this late season of the year, and under many disadvantages, had made good their retreat to Corunna. Sir John Hope's division had been ordered to keep in check the French corps, which had bivouacked on the heights opposite Lugo; and on 7th January, 1809, they attacked Major-general Leith's brigade, with four pieces of cannon, on the side of a ravine which separated the two armies; but were gallantly repulsed by General Leith, who, at the head of his light companies, drove them into the ravine, and dispersed them. When the British had reached Corunna, after one of the most arduous retreats ever undertaken, in the depth of winter, and the minds both of men and officers were cast down with the hardships of their situation, they encamped in front of the town, that they might afford protection to the harbour and the commissariat; the fleet not having yet arrived from Vigo. The French army, having passed the river on the 16th January, 1809, occupied the rising ground above the village of Burgos; their left was protected by the wood above the village of Elvina, and their right rested on the great road from Betanzos, under the command of Marshal Soult. The third column of the enemy, directing from its centre an attack against the left of the guards and the 81st regiment, General Leith being ordered to place himself at the head of the 59th, made a charge, principally with the grenadiers of the regiment, and forced the enemy to retreat upon his position; while Major-general Paget, with part of the reserve, bravely sustained an attack on the British right, and threatened to outflank the enemy. The heavy cannonade kept up by the French, in which they had a decided advantage, did fatal execution; but the village on the El Burgo road, that had been occupied by a column which prevented the British from sending succours to the chief points of attack, being carried by part of the 14th regiment, under the command of Lieutenant-colonel Nicolls, at the point of the bayonet, the enemy retired to his commanding position.

The advanced posts of the British took possession of their original station, and the darkness of the night put a stop to a battle in which the chief by his bravery, and the sacrifice of his own life, redeemed the honour of the British army from a retreat allowed to have been somewhat precipitate.

Having been in September, 1810, appointed to the command of a corps of 10,000 men, General Leith was next engaged in the affair of Busaco in Spain, where the whole French army, under Marshal Massena, was assembled. This corps was stationed between the division of Sir Rowland Hill on his right, flanked by the Mondego river and the third division on his left. At break of day the guns at the convent of Busaco opened a heavy fire, and a serious attack was made on the third division posted on that part of the sierra near the great road to St. Antonio de Cantara. General Leith moved to the support of this division, but meeting with a strong column of the enemy on their way to this point, he quickly brought up Colonel Barnes' brigade, the 9th and 38th regiments, to the head of the column, and after a well-managed fire, drove them, at the head of the 9th regiment, from their position. The light troops of the third division were already driven back from the heights, with loss, by the enemy; but with that promptitude and firmness for which he was distinguished, General Leith attacked them by a rapid movement, and, after a brilliant charge at the head of the 9th or 88th regiment, before they had time to form or collect in numbers, General Regnier was obliged to desist, while the column which attacked the left was driven into the valley of Mondego. In this engagement 7000 of the enemy were either slain or taken prisoners, and, in consequence of it, Massena's direct communication with Lisbon was obstructed. Had General Trant arrived in time at the position of Sardao, as Lord Wellington had expected, the French army would have been placed in a very critical situation, and with difficulty have escaped.

Lord Wellington was now reinforced by two divisions, the fifth, which was committed to the charge of Major-general Leith, consisting of Major-general Hay's, Major-general Dunlop's, and Brigadier-general Spry's brigades; and the sixth, commanded by Major-general Campbell. The British army was now encamped in the strongholds of the Torres-Vedras, covering the town of Lisbon, to take which the enemy found impracticable, and soon retreated. But General Leith, suffering a severe attack from the Walcheren fever, was under the necessity of leaving Lisbon and returning to England. The French now made a rapid retreat, and being pursued by Wellington, were speedily driven from Portugal, with the exception of one garrison at Almeida. Having rejoined the army which had taken possession of Ciudad Rodrigo, General Leith sat down before the fortress of Badajos. The siege of this fortified place had been commenced on the 16th March, and a fire being opened on the 25th, with 28 pieces of ordnance, the outwork called La Picurina was stormed by 500 men of the third division; the second parallel was opened, and 26 pieces of cannon were directed against the bastion of the south-east angle of the fort called La Trinidad, the flank of Santa Maria, and the curtain of La Trinidad, where three breaches were effected. The fourth and light divisions, which during the siege had occupied the ground that was now assigned to the fifth, under Major-general Leith, were appointed to attack the trenches on the bastions of La Trinidad and Santa Maria. The Honourable Major-general Colville, with the fourth and light divisions under Colonel Barnard, proceeded by the

river Rivellas, descended without difficulty into the ditch, and advanced to the assault of the trenches with great bravery; but from the numerous explosions which took place at the top of the breaches, the whole place appearing to be one mine, and throwing out bullets, they were unable to enter. The governor, Philippon, allowed to be one of the best engineers in the French service, had provided for the defence of the breaches by placing a chevaux-de-frise, its beam a foot square, with points projecting a yard in every direction, across the gorge, and by fastening to the ground, around the mouth of the breach, pieces of wood with sword-blades and bayonets, besides placing a column of soldiers behind, eight deep. An incessant fire was kept up by the front ranks, which were supplied with loaded pieces by those who stood behind. Major Wilson, of the 48th regiment, which had been sent against the ravelin of San Roque, had carried it by the gorge, and with the assistance of Major Squire established himself in the place.

In the meantime Lieutenant-general Leith, who had been directed to make a false attack on the Pardaleras, and, if possible, escalate the bastion of San Vicente, had executed the former part of his order with the 8th cacadores under Major Hill. He now pushed forward Major-general Walker's brigade on the left, supported by the 38th regiment, under Lieutenant-colonel Nugent, with which he proceeded about eleven o'clock to the attack of this almost impregnable fortress. He forced the barrier on the road to Olivenza, and entering the covered way at the bastion of San Vicente, descended into the ditch, and was already at the foot of the scarp of the bottom, which was thirty-one feet six inches high, defended by a flank with four guns, with a counterscarp wall eleven feet nine inches deep, and a ditch. Of all the other divisions engaged in the reduction of this fortress, the third or fighting division alone had been able to execute their orders; this, under the gallant Lieutenant-general Picton, had forced the palisadoes, passed the ditches, surmounted the wall (twenty-six feet high) with ladders, and, exposed to a heavy fire and severe loss, fought its way to the castle, which eventually was taken. The fourth division, in endeavouring to mount the breach of La Trinidad and Santa Maria, was obliged to retire on its reserves in the quarries by means of a strong concentrated and cross fire. But General Leith, who set all calculation at defiance, and was exposed to a most destructive fire while yet on the glacis, neglecting entirely the flanks, escalated the bastion of San Vicente with less than twelve ladders, and in the face of the enemy, who lined the works, mounted the ramparts, thirty-one and a half feet high, drove the defenders before him, and thus gave the signal of victory, by taking possession of the town. He now silenced the batteries near the breach, which had greatly annoyed the third division, opened a communication at the breaches for the light and fourth divisions to enter, and the sound of the trumpets giving the signal of advance was now heard in every direction, while the enemy, distracted on all hands, were able to make but a feeble resistance. This escalate, which has been considered by the historians of the Peninsular war as an extraordinary instance of British valour and intrepidity, was decisive as to the fate of Badajos. The fortress quickly yielded to the allied troops, and the British flag was quickly seen waving over its battlements, the French eagle being trampled in the dust, but not before 700 alone of the fifth division were either killed or wounded.

Lord Wellington now pushed forward to Salamanca, the depot for the army of Portugal, where

the Duke of Ragusa had left a garrison of 800 men, and encamped his army on the plain of Villares, a position at no great distance. The convent of San Vicente was reduced by means of hot shot, Gayetano carried, and these, together with another fort, entirely destroyed. The French and British armies—the former of which was vastly superior—after several unsuccessful attempts to bring each the other into action, marched in column simultaneously along the heights, by parallel movements, in the direction of Salamanca, frequently cannonading and skirmishing. The Duke of Ragusa, on the left bank of the river Douro, occupied one of the Arapiles, his left resting upon an extensive forest; an important station, where he could readily annoy the communication with Ciudad Rodrigo, and otherwise embarrass the British army in its movements. In making a feint opposite the fifth division, however, and bringing forward his left wing in a direction parallel almost with the right of the British, and apparently to force their post on the Arapiles and annoy them on the right, he extended his army too far; and Lord Wellington, who had determined to retire into his stronghold at Ciudad Rodrigo, observing this favourable opportunity, resolved to give battle, and for this purpose rapidly moved the third division across the valley to the left of the enemy, from the extreme right on the Ciudad Rodrigo road, where it had commenced its retreat, and attacked them by surprise on the flank. The main body of Marmont's army had crossed the Tormes by the fords of Huerta. To the left of the British cavalry stood the fourth and fifth divisions, which extended in two lines to the foot of the Arapiles, near the Portuguese regiments; the first and light divisions being drawn up to the left of the Arapiles, and the sixth and seventh kept in reserve. Lieutenant-general Leith, having opened himself upon Brigadier-general Bradford's Portuguese brigade, when it came parallel with his front-line, was ordered to direct his march to the heights, and dislodge the enemy. In conjunction with the fourth and fifth divisions the front was attacked by Brigadier-general Bradford's brigade and the cavalry under the command of Sir Stapleton Cotton. This order was the more welcome as the fifth division had been for an hour exposed to a galling and murderous fire; and having equalized the two lines into which it had been divided, and regulated the advance, the gallant captain, afterwards Colonel Leith Hay, M.P., who had at this time a horse killed under him, was despatched as aid-de-camp with an order for the light infantry in front to clear the line of march of the enemy's voltigeurs, and secure, if practicable, some of the most advanced of their guns, which amounted to 20 opposite the fifth division alone. General Bradford's brigade, and the heavy cavalry of General Le Merchant, which had been on the right of the fifth, moved in unison with that division. The second line of the division was about a hundred yards in the rear of the first, and between these at one time Lord Wellington was stationed, while watching the progress of the attack. In front rode General Leith, directing its movements and regulating the approach of the troops, who had formed into squares; and when with his staff he reached the summit of the eminence where the artillery which had so annoyed them had been placed, about a mile from his former station, he found the enemy drawn up in contiguous squares, the front rank kneeling, and ready to pour their murderous shot into the British line. A heavy fire commenced as soon as they broke over the heights, and discharging their musketry when about thirty yards from the enemy, the fifth raised a shout of triumph, advanced to the charge, and at the point

of the bayonet pierced the enemy's squares, which were soon put into disorder and broken, the cavalry having cut in pieces a body of their infantry. The victorious fifth pressed forward, supported on the right flank by the heavy cavalry of Le Merchant, while General Pakenham, brother-in-law to Lord Wellington, at the head of the third division and the Portuguese cavalry of D'Urban, turned the enemy's left in four columns, and attacking them in flank overthrew everything that opposed them. For a time the fourth division was unable to drive back Bonnet's column, which outflanked it; but on the approach of the fifth and sixth divisions, which came to their assistance, the other parts of the French army being already in disorder, they were driven back in confusion on their own centre, and the third and fifth pressing forward, had the honour of deciding the battle of Salamanca, although the other parts of the British army fought bravely, and upheld the glory of the British name. General Leith, who had stationed himself in front of the colours of the 38th regiment, still maintained his position between the two hostile fires, and drove the enemy before him; but during this tremendous charge, while in the act of breaking the French squares, he received a severe wound which eventually caused him to quit the field. The right wing of the enemy's army was the last to give way, but being charged by the sixth, third, and fifth divisions in front, and pressed on the right by the fourth, light, and Portuguese divisions, it at length fled through the woods towards the Tormes, and was pursued by a brigade of the fourth, and some squadrons of cavalry, until night put a stop to the chase. The loss of the fifth division alone was 800 killed and wounded. The loss of the other divisions of the British army was equally severe, amounting in all to 840 killed, and 4723 wounded; but that of the enemy under Marmont, who was himself wounded by a howitzer shell, was 22,000 killed, and 7000 prisoners, out of an army amounting to between 46,000 and 50,000 men.

General Leith and his aid-de-camp, Captain Leith Hay, who was also severely wounded, were carried to the village of Las Torres, and from thence to the house of the Marquis Escalla in Salamanca, where the victory was celebrated by song and seguidillas, and every demonstration of joy. The distinguished merit of Lieutenant-general Leith during the Peninsular war was rewarded by the insignia of the Bath, as a special mark of the prince-regent's favour "for his distinguished conduct in the action fought near Corunna and in the battle of Busaco; for his noble daring at the assault and capture of Badajoz by storm; and for his heroic conduct in the ever-memorable action fought on the plains of Salamanca, where, in personally leading the fifth division to a most gallant and successful charge upon a part of the enemy's line, which it completely overthrew at the point of the bayonet, he and the whole of his personal staff were severely wounded." Several other marks of royal favour, in the spirit of ancient chivalry, were conferred upon him. His majesty gave his royal license and command "that to the armorial ensigns of his family, being a cross crosslet fitchée between three crescents in chief, and as many fusils in base, he may bear the following honourable augmentation, viz. on a chief, a bastion of a fortification intended to represent San Vicente, the British ensign hoisted on the angle, and the two faces near the salient angle surmounted each by two scaling ladders; and the following crest of honourable augmentation, viz. out of a mural crown inscribed with the word 'Salamanca,' a demi-lion, regardant quite de sang, in

the mouth and sinister paw an eagle, or standard reversed, the staff broken, intended to represent the French standard taken by the said fifth division of his majesty's army in the said ever-memorable battle of Salamanca, to be borne and used with the motto 'Badajos,' by the said Sir James Leith, and by his descendants, as a memorial to them and to his majesty's beloved subjects in general, of the sense which his royal highness entertains of his loyalty, ability, and valour; provided the said armorial distinction be first duly exemplified, according to the law of arms." The hero of Badajos and Salamanca, for so he is virtually acknowledged to be by this mark of royal favour, was also permitted to wear the insignia of an honorary knight-commander of the Portuguese royal military order of the Tower and Sword, conferred upon him as a mark of distinction for his bravery by the government of that country.

In April, 1813, the subject of our memoir, from the effects of the Walcheren fever, which he still felt, and the severe wound which he had received, was obliged to retire to England. Subsequently to this period the British army, under its renowned leader the Marquis of Wellington, took the offensive, and defeated the army of the south, the army of Portugal, and the army of the centre, under Marshal Jourdan in the battle of Vittoria, and compelled Joseph Bonaparte, who had been crowned King of Spain, to retire and quit that country. The marquis was successful in the battles of the Pyrenees, and resumed the siege of San Sebastian, which had been interrupted by the advance of the enemy. San Sebastian is situated in a peninsula, on the extremity of which rises a conical rock, of remarkable appearance, called Monte Orgullo, where the castle stands, distinctly separated from the town by an outer line of defence. The town, previously to the siege, contained a large population; its northern wall being washed by the river Urumea, the southern by the sea; and the western defences consist of a double line of works. It was a place of great strength, and possessed a garrison of 4000 troops. The siege had been commenced by the fifth division of the army and two Portuguese brigades, under Lieutenant-general Sir Thomas Graham; but it was not till the 23d of July that two breaches, one of them 100 feet in length, had been effected, when an attempt was made to take the citadel, and the British were driven back, after they had penetrated into the town, with the loss of 900 men. Lord Wellington ordered another assault, after reconnoitring the breaches on the 31st of August, and as Sir James Leith had now joined the army, the immediate command of the storm was intrusted to this brave officer. The sea-wall having been levelled to the ground, the storming commenced at the two breaches, which were in the same curtain, at eleven in the forenoon, when the fall of the tide had left the wall dry; and in approaching, there was but one point where it was possible to enter, as the inside of the wall to the right of the curtain formed a perpendicular scarp of at least twenty feet to the level of the streets, and every point which bore upon the narrow passage was covered with men protected by intrenchments and traverses, who poured their destructive and successful fire upon the assailants as they approached. Many volunteers from the other divisions of the army had joined the fifth division, and notwithstanding the bravery of the troops, and the judicious arrangements of Sir James Leith, as they advanced they were mowed down like grass by the musketry of the defenders, particularly from the hornwork, and the shell and grape-shot from the batteries of the castle. The storm had now become a desperate one; but the presence of their commander,

who stood in a commanding and most exposed situation, about thirty yards in advance of the debouche from the trenches, and who conducted the attack in a truly heroic style, inspired them with unshaken confidence as they threaded their way through the large masses of the wall thrown down by the explosion of two mines; and General Robinson's brigade advanced to the breach, although for a long time no one outlived the attempt to gain the ridge of the wall. As they filed onwards they stumbled over their prostrate companions; and so great was the slaughter, that Sir James was obliged to send a staff officer with directions to remove the dead and the dying for the passage of the troops. About the same time Sir James Leith was thrown to the earth in an insensible state by the rebound of a plunging shot which had struck the ground; but refusing to quit the field, he continued to issue his orders in his usual precise and energetic manner, and while he was himself stooping to the ground cheered forward his troops.

Major-general Hay's division, consisting of the royals, 9th and 38th regiments, and a column of Portuguese infantry, forded the Urumea, and reached the lesser breach, under a very heavy and destructive fire. The British had persevered under a most murderous shower of round shot, grape, and musketry, to force an entrance into the town for two hours; and General Robinson's brigade had ascended to the crest, where he was severely wounded, whilst a fire of artillery had been directed against the curtain, passing only a few feet over their heads on the breach, which produced an immediate and advantageous effect. But although the exterior wall was completely beaten down, together with the houses fronting the interior, the inner retaining wall, which added greatly to the strength of the curtain, was as perfect and perpendicular as at first, varying from sixteen to thirty-five feet of altitude from the level of the town. Forty-seven pieces of heavy ordnance playing from the choffres and hills over the heads of the British troops, a mode of attack which evinced the resolution and self-confidence of Colonel Dickson and Sir Thomas Graham, who had recourse to it, as well as the skill of the British artillery, dispersed the fire of musketry, soon dismounted all the guns but two, and had the effect of driving the enemy back. To descend into the town by the breaches was yet found impracticable, for the enemy had constructed traverses, behind which were stationed French grenadiers, who put to death in safety the gallant soldiers as they attempted the passage, capable of admitting only one at a time; and yet their commander was convinced, and by his personal courage had shown that he was so, that British troops were invincible, and would do what human power could accomplish. A great explosion had taken place along the line of the wall, of fire-barrels, live shells, and hand-grenades, which had been placed in rear of the traverses by the besieged, and cleared it of the enemy. Under the panic occasioned by this catastrophe, the soldiers of General Hay's brigade, now commanded by Colonel Greville, the Royal Scots, and 9th regiment, under Colonel Cameron, entered by the passage along the curtain, close to the exterior wall, which was capable of admitting only one at a time; and charging the enemy at the point of the bayonet, down the flight of steps which led from the cavalier bastion, entered the town, and maintained their ground. Sir James Leith, who had long directed the progress of the assault from the strand at no great distance from the great breach, and who was completely exposed to the fire of the enemy, while in the act of directing additional sup-

port from the trenches, had before this time been wounded by the bursting of a shell near him, which broke his arm in two places, tearing the flesh from his left hand, and was reluctantly carried from the field, after fainting from loss of blood. In passing through the trenches he was recognized by the 9th regiment, whose dangers he had so often shared, who spontaneously cried out, that they should not return until the fifth division was crowned with victory, and the citadel of San Sebastian was taken. Soon afterwards Sir Richard Fletcher, the chief engineer, who had continued with Sir James during the siege, was killed by a musket-ball, which pierced his heart.

The command was now taken by Major-general Hay, who conducted with ability the attack to the last; and the issue was no longer doubtful, for the troops easily rushing forward, the hornwork was carried; the ruined fragments of the houses poured forth the assailants; the Portuguese detachments carried the lesser breach; and although the commander of the brave garrison, General Roy, had raised traverses across the streets, which were defended by cannon, one street was taken after another, till the allies gradually gained possession of the town, and at three o'clock this awful and murderous struggle terminated, which had raged with unabated fury during a period of four hours, and was maintained by both parties with desperate gallantry and resolution.

A barbarous scene of pillage and plunder now took place, unworthy of the British name and the high character of her soldiers; while on the 18th of September the castle surrendered, and thus the allies obtained possession of this northern Gibraltar of Spain, as it has been termed, with the loss of 500 killed and 1500 wounded.

Sir James Leith remained for two months in the country, trusting that an early recovery would permit him to resume his command; but it was at length found more advisable to return to England, which he did in November. He was now appointed commander of the forces in the West Indies and captain-general of the Leeward Islands, and, sailing to assume his important duties, arrived at Barbadoes on the 15th of June, 1814. The revolutionary spirit which broke out in France on the restoration of Napoleon soon extended itself to the French islands in the West Indies, and Martinique and Guadeloupe, which Sir James had restored to the crown of France, now at peace with Britain, soon manifested symptoms of revolt. The former, agreeably to instructions, was kept in awe by the presence of 2000 British troops, which were landed at Fort Royal; but at Guadeloupe the tricoloured flag was soon displayed, and the entire colony declared for the emperor. Transports, conveying troops, ammunition, and stores, immediately sailed from Barbadoes, and landed at Saintes, in the neighbourhood of Guadeloupe, which is upwards of 200 miles in circumference, and contains a population of 110,000 people. Preparations for war were then made, and Marie-galante was secured by a detachment of troops. The Comte de Linois, the French governor, who had organized a large body of militia, and never believed that the French army could be ready for action before the commencement of the hurricane months, was somewhat taken by surprise; and the commander of the forces having despatched 800 of the York rangers near Pautrizel, and an additional reinforcement, they drove the enemy from Dolet. Captain Leith Hay, aid-de-camp to Sir James Leith, obtained possession of Mome Boucannier, a height which commanded their position at Palmiste, from which they were dislodged, rapidly pressed their rear near Morne Honel,

and the heavy rains being now set in, on the 10th of August Sir James Leith was prepared to give battle, when they agreed to capitulate and surrender the island.

As a reward for these important services, the privy-council voted £2000 for the purchase of a sword, and the King of France, as a mark of the sense which he entertained of his great zeal, ability, and bravery, conferred upon him the grand cordon of the order of Military Merit. The object of these honours was soon, however, to be insensible to the pleasure which they were calculated to bestow. His constitution, shaken by the wounds which he had received, sank under the sultry climate of the West Indies; and he died of fever, after six days' illness, on the 16th of October, 1816.

Sir James Leith is invariably allowed to rank among the very highest of the excellent officers who seconded the efforts of Wellington during the Peninsular contest, and to whom that illustrious commander, who has now followed so many of his companions in arms to the grave, was himself the readiest to attribute the better share of the success which attended him in those memorable campaigns. He possessed all the qualities which form a great military character—intrepidity unbounded, or bounded only by the soundness of his judgment; skill in taking advantage of every contingency; and a genius for contriving, as well as perseverance and dexterity in executing, the most brilliant enterprises. To all these characteristics Sir James added that spirit of humanity which forms the crowning grace of this, even more peculiarly than any other, profession.

LESLIE, ALEXANDER, the celebrated military leader of the Covenanters during the civil wars of Charles I., created Lord Balgonie, and afterwards Earl of Leven, was the son of Captain George Leslie of Balgonie, by his wife Anne, a daughter of Stewart of Ballechin. Of the place of his birth, or the extent of his education, little can be said with certainty. Spalding says he was born in Balveny, which Gordon of Straloch affirms was never possessed by the Leslies, and of course, according to him, could not be the place of his birth. This he supposes to have been Tullich, which lies over against Balveny, on the east side of the water of Fiddich; or perhaps Kininvie, which lies a mile to the north of Tullich, on the same water of Fiddich. Gordon adds, that he "was a natural son of Kininvie's, and that his mother, during her pregnancy, could eat nothing but wheat bread, and drink nothing but wine, which Kininvie allowed her to be provided with, although she was nothing but a common servant." There is, however, much reason to suppose that this account of his birth is only a cavalier fiction.

Educated for the military profession, Leslie very early in life obtained a captain's commission in the regiment of Horatio Lord de Vere, then employed in Holland as auxiliaries to the Dutch in fighting for their liberties against the overwhelming power of Spain. In this service he acquitted himself with singular bravery, and obtained the reputation of a skilful officer. He afterwards, along with many thousands of his countrymen, passed into the service of Sweden, under Gustavus Adolphus, by whom, after many heroic achievements, he was promoted to the rank of field-marshal, with the approbation of the whole army.

In the year 1628 he defended Stralsund, which was besieged by the whole force of the Imperialists, at that time masters of all Germany, that fortress excepted. Here he acquitted himself with the utmost bravery and skill. The plague had already

broken out in the city, and the outworks were in a most deplorable condition; yet he compelled Count Wallenstein, with a formidable army and flushed with victory, to raise the siege, after having sustained a severe loss. The citizens of Stralsund were so sensible of the services of the field-marshal on this occasion, that they made him a handsome present, and had medals struck to perpetuate their gratitude, and the honour of their deliverer. In the year 1635 he had charters granted to him, his wife, and son, of the barony of Balgonie, and other lands in the counties of Fife, Berwick, and Roxburgh. He was at this time serving in Lower Saxony. In the year 1639, when the Covenanters were preparing to resist their sovereign in the field, Leslie returned from Sweden, where he had continued after the death of Gustavus in the service of Christina. "This Leslie," says Spalding, "having conquest from nought wealth and honour, resolved to come home to his native country of Scotland and settle himself beside his chief, the Earl of Rothes, as he did indeed, and bought fair lands in Fife; but the earl foreseeing the troubles, whereof himself was one of the principal beginners, took hold of this Leslie, who was both wise and stout, acquainted him with the plot, and had his advice for the furtherance thereof to his power."

It was a fortunate circumstance for the Covenanters that the oppressions to which they had been subjected, and the persecutions that were evidently preparing for them, were well known on the Continent, where thousands of their fellow-countrymen had been shedding their blood in the defence of the religion and liberties of their fellow-Protestants, and excited the deepest interest in their favour. Leslie had undoubtedly been invited home, and he brought a number of his countrymen along with him, who, having perilled their lives for the same cause among foreigners, could not reasonably be considered as indifferent to its success among their own countrymen. Half a century had, for the first time since it was a nation, passed over Scotland without anything like general warfare. The people had, in a great measure, become unaccustomed to its hardships and its dangers, and the chieftains, such as had been abroad excepted, were unacquainted with its practice, and ignorant of its details. This defect, by the return of so many who had been in the wars of Gustavus, was amply supplied. Leslie was, by the committee of estates, appointed to the chief command;—many of his fellow-adventurers of less celebrity, yet well acquainted with military details and the equipment of an army, were dispersed throughout the country, where they were employed in training the militia, which in those days comprehended every man that was able to bear arms from the age of sixteen to sixty. By these means, together with a manifesto by the Tables (committees of the four estates assembled at Edinburgh), entitled *State of the Question, and Reasons for Defensive War*, which was circulated so as to meet the eye or the ear of every individual in the nation,—the Covenanters were in a state of preparation greatly superior to the king, though he had been meditating hostilities long before he declared them. Though now an old man, little in stature, and deformed in person, Leslie was possessed of ceaseless activity, as well as consummate skill; and in both he was powerfully seconded by the zeal of the people in general. Early apprised of the intentions of Charles, he so managed matters as to render them entirely nugatory. It was the intention of the latter, while he advanced with his main force upon his ancient kingdom by the eastern marches, to enter it previously, or at least simultaneously, on the western side, with a body of

Highlanders and Irish, and by the Firth of Forth with a strong division of his English army, under his commissioner the Duke of Hamilton. To meet this formidable array everything that lay within the compass of their limited means was prepared by the Covenanters. Military committees were appointed for every county, who were to see to the assembling and training of the militia generally, and to forward to the army such levies and such supplies as might be from time to time demanded. Smiths were everywhere put in requisition for the fabrication of muskets, carbines, pole-axes, Lochaber-axes, and halberds; magazines to supply the troops were also provided; and to call them together when occasion should require beacons were provided, and placed in every shire. Arms to the amount of 30,000 stand were provided from Holland, in addition to those of home manufacture, and a foundry for cannon was established in the Potter Row, at that time one of the suburbs, now a street of Edinburgh. Leith, the port of the capital, was, however, still defenceless; but, aware that the Duke of Hamilton proposed to land there with hostile intentions, it was immediately resolved to put the place in a posture of defence. The plan of a new fort, the old defences of the town being in ruins, was laid down by Sir Alexander Hamilton, who acted as engineer to Leslie; and several thousands came spontaneously forward to assist in its erection. Noblemen, gentlemen, and citizens—men, women, and children—even ladies of quality—claimed the privilege of assisting in forwarding the good work, and in less than a week it was finished, and the security of Edinburgh was considered complete. Along the coast of Fife, too, every town was surrounded with batteries mounted with cannon carried on shore from the ships; and with the exception of Inchkeith and Inchcolm, which were somehow neglected, there was not a resting-place in the Firth for an enemy till he should win it at the point of the pike.

In the meantime the Duke of Hamilton, lying in Yarmouth Roads, was commanded to sail for the Forth, and by all or any means to "create an awful diversion." His first sail was no sooner discovered as a speck in the distant horizon, than the beacons were in a blaze from the one extremity of the country to the other, and ere he approached the shores of Leith they were lined by upwards of 20,000 intrepid defenders, among whom was his own mother, mounted on horseback at the head of her vassals, with a pair of pistols in the holsters before her, with which she declared she would shoot her son with her own hand the moment he set a hostile foot on shore. Hamilton now found that he could do nothing. The troops on board his fleet did not exceed 5000 men, all raw young peasants, miserably sea-sick, and many of them labouring under the small-pox. Instead of attempting hostile operations, he landed his men upon the islands of Inchkeith and Inchcolm, which served him for hospitals, and contented himself with sending into the town-council some more of Charles' proclamations, which were promised to be laid before the states, who were expected to meet in a few days. This, as the measure of their obedience, Hamilton was for the time obliged to accept. Of this circumstance, with the strength which they mustered, he failed not to acquaint his master, advising him at the same time to negotiate.—We are not detailing the history of the war, but the part performed in it by an individual, or we should have stated that Argyle had been sent to the west, where he had seized upon the castle of Brodick in Arran, where the Earl of Antrim was to have first headed his Irish bands, in consequence of which they were

for a time unable to come forward. The castle of Dumbarton had also been seized by a master-stroke of policy, as that of Edinburgh now was by the same in war. In the afternoon of the 23d of March, Leslie himself, with a few companies which he had been, according to his usual custom, training in the outer courtyard of Holyrood House, some of which he secretly disposed in closes at the head of the Castle Hill, approached to the exterior gate of the castle, where he called a parley with the captain or governor, demanding to be admitted. This being refused, he seemed to retire from the gate, when a petard which he had hung against it burst and laid it open. The inner gate was instantly assailed with axes, and scaling-ladders were applied to the wall, by which the Covenanters gained immediate admission; while the garrison, panic-struck with the sudden explosion and the vigour of the attack, surrendered without offering any resistance. The castles of Dalkeith, Douglas, and Strathaven in Clydesdale, and, in short, all the castles of the kingdom, with the exception of that of Carlaverock, were seized in the same manner. Huntly, who was making dispositions in the north to side with Charles, had also in the interim been kidnapped by Montrose, so that he had actually not the shadow of a party in the whole kingdom. Towards the end of May, the king beginning to move from York, where he had fixed his head-quarters, towards the north, the army under Leslie was ordered southward to meet him. The final muster of the army previous to the march took place on the Links of Leith, on the 20th of May, 1639, when from 12,000 to 16,000 men made their appearance, well armed in the German fashion, and commanded by native officers, whom they respected as their natural superiors, or by their own countrymen celebrated for their hardihood and that experience in military affairs which they had acquired abroad. With the exception of one German trumpeter there was not a foreigner among them: all were Scotsmen, brought immediately from the hearths and the altars which it was the object of the war to defend. The private men were, for the most part, ploughmen from the western counties; stout rustics whose bodies were rendered muscular by healthy exercise, and whose minds were exalted by the purest feelings of patriotism and religion. It was on this day that they were properly constituted an army by having the articles of war read to them. These had been drawn out by Leslie with the advice of the Tables, after the model of those of Gustavus Adolphus, and a printed copy of them was delivered to every individual soldier. The general himself, at the same time, took an oath to the estates, acknowledging himself in all things liable both to civil and ecclesiastical censure. Leslie had by this time acquired not only the respect and confidence, but the love, of the whole community, by the judgment with which all his measures were taken, and the zeal he displayed in the cause; a zeal, the sincerity of which was sufficiently attested by the fame of his exploits in Germany, and by the scars which he bore on his person in consequence of these exploits. He was deformed, old, and mean in his appearance; but the consummate skill which he displayed, and the piety of his deportment, rendered him, according to Baillie, who was along with him, a more popular and respected general than Scotland had ever enjoyed in the most warlike and beloved of her kings. With the van of this army, which was but a small part of the military array of Scotland at this time, Leslie marched for the borders on the 21st of May, the main body following him in order. He was abundantly supplied on his march, and at every successive stage found

that his numbers were increased, and his stock of provisions becoming more ample. The first night he reached Haddington, the second Dunbar, and the third Dungglass, a strong castle at the east end of Lammermoor, where he halted and threw up some intrenchments. Charles in the meantime advanced to the borders, indulging in the most perfect assurance of driving the Scottish insurgents before him. Learning from his spies, however, that they were within a day's march of him, and so well marshalled that the result of a contest would be at best doubtful, he ordered a trumpet to be sent with letters from himself to the Scottish army, conveying overtures of a friendly nature, but forbidding them to approach within ten miles of his camp, and on this demonstration of their temporal obedience promising that all their just supplications should be granted. Finding them disposed to an amicable agreement, Charles advanced his camp to the Birks, on the banks of the Tweed, and directed the Earl of Holland, his general of horse, to proceed with thirteen troops of cavalry, 3000 foot, and a number of field-pieces, to drive some regiments of the Covenanters which had been stationed at Kelso and Jedburgh under Colonel Robert Monro, for the protection of the borders, from their station, as being within the limits stipulated with the noblemen who commanded the main body. Proceeding, in the execution of his order, to Dunse, the first town that lay in his way within the Scottish border, the Earl of Holland found it totally deserted of its inhabitants, except a very few, who heard him read a proclamation declaring the whole Scottish nation, especially all who were in arms and did not immediately lay them down, traitors. Proceeding westward to Kelso, and having reached a height overlooking the town, he found the Scottish troops in the act of being drawn out to receive him. Startled at their appearance, Holland sent forward a trumpet, to command them to retire, according to the promise of their leaders. His messenger was met by a stern demand whose trumpeter he was, and on answering that he was Lord Holland's, was told that it would be well for him to be gone. Displeased with this reception of his missionary, his lordship ordered a retreat, and the Scottish soldiers were with difficulty restrained from pursuing them to their camp. What share Leslie had in the proposed submission to Charles is not known; but he no sooner heard of the above affair than he broke up his encampment at Dungglass, and set forward to Dunse, where he ordered Monro to join him. Finding here an excellent position commanding both roads to Edinburgh, he formed his camp on the law behind the town, where he could see the royal camp at Birks, on the other side of the Tweed. This movement was made without the knowledge of the English, whose camp Leslie, had he been left to himself, would most probably have surprised and secured with all that was in it. Charles himself, walking out after an alarm from the Scottish army, was the first to descry their encampment on Dunse Law, and he rightly estimated their number to be from 16,000 to 18,000 men; they were soon, however, increased to 24,000 by the reinforcements that hastened up to them on the report of the English incursions at Dunse and Kelso; and never was an army led to the field better appointed, or composed of better materials. "It would have done your heart good," said an eye-witness, "to have cast your eyes athwart our brave and rich hills as oft as I did, with great contentment and joy. Our hill was garnished on the top toward the south and east with our mounted cannon, well near to forty, great and small. Our regiment lay on the sides; the crowners [superior

officers of regiments] lay in canvas lodges, large and wide; their captains about them in lesser ones; the soldiers about all in huts of timber, covered with divot or straw. Over every captain's tent door waved the flag of his company, blue, with the arms of Scotland wrought in gold, with the inscription 'For Christ's Crown and Covenant.' Leslie himself lay in the castle of Dunse, at the bottom of the hill, whence he issued regularly every night, rode round the camp, and saw the watches regularly set." Throughout the whole army there was the most perfect harmony of opinion, both as to matters of civil and ecclesiastical polity; and there was a fervour in the cause they had undertaken, that burned with an equal flame in the bosom of the peasant and the peer. The latter took their full share in all the fatigues of the camp; slept, like the common soldiers, in their boots and cloaks on the bare ground; and in their intercourse with their inferiors used the language of affection and friendship, rather than that of command. Ministers of the gospel attended the camp in great numbers, carrying arms like the rest, and many of them attended by little parties of their friends and dependants. There were sermons morning and evening in various places of the camp, to which the soldiers were called by beat of drum; and while the day was devoted to the practice of military exercises, its rise and its fall were celebrated in every tent with the singing of psalms, reading the Scriptures, and prayer. The general tone of the army was ardent, full of devotion to God and of the hope of success against the enemy. "They felt," says Baillie, "the favour of God shining upon them, and a sweet, meek, humble, yet strong and vehement feeling leading them along. For myself, I never found my mind in better temper than it was all that time since I came from home, for I was as a man who had taken my leave from the world, and was resolved to die in that service without return." While they were thus strengthened in spirit, the body was equally well attended to. The regular pay of the common men was sixpence a day; fourpence purchased a leg of lamb, and all of them were served with wheaten bread; a luxury which it is probable many of them never enjoyed either before or after. Leslie kept open table daily at Dunse Castle for the nobility and for strangers, besides a side-table for gentlemen waiters; and as there had been an extraordinary crop the preceding year, and the people were zealous to offer supplies, the camp abounded with all the necessities of life. An amicable arrangement, however, having been entered into between Charles and the Covenanters, peace was proclaimed in both camps on the 18th of June, 1639.

In the month of April, 1640, it was found necessary by the Covenanters to reassemble their army, and Leslie was again appointed general; but from various causes it was the beginning of August before the general armament could be collected at Dunse, where, in the early part of that month, it was reviewed by the general. It amounted to 23,000 foot, 3000 horse, and a train of heavy artillery, besides some light cannon, formed of tin and leather corded round, capable of sustaining twelve discharges each. This was a species of artillery used by Gustavus Adolphus, and which the Scottish general had adopted in imitation of his master. This army was composed of the same men who had last year occupied Dunse Law. The horse were chiefly composed of respectable citizens and country gentlemen lightly armed; some of them having lances, and generally mounted on the small but active horses of the country. Their attire and accoutrements were the same

as in the preceding year, including the broad Lowland blue bonnet. Their march over the border was, however, delayed for some weeks for the want of money and necessaries. "It was found," says Mr. John Livingston, who accompanied the army in the capacity of chaplain to the Earl of Cassilis' regiment, "when the whole army was come up, that there was want of powder and of bread, the biscuit being spoiled, and of cloth to be huts to the soldiers. This produced some fear that the expedition might be delayed for that year. One day when the committee of estates and general officers and some ministers were met in the castle of Dunse, and were at prayer and consulting what to do, an officer of the guard comes and knocks rudely at the door of the room where we were, and told there was treachery discovered; for he, going to a big cellar in the bottom of the house, seeking for some other thing, had found a great many barrels of gunpowder, which he apprehended was intended to blow us all up. After search it was found that the powder had been laid in there the year before, when the army had departed from Dunse Law, and had been forgotten. Therefore, having found powder, the Earls of Rothes and Loudon, Mr. Alexander Henderson and Mr. Archibald Johnston, were sent to Edinburgh, and within a few days brought as much meal and cloth to the soldiers by the gift of well-affected people there, as sufficed the whole army. With the same readiness that these people had parted with their cloth and their meal, others parted with their plate, and to such an extent was this carried, that for many years afterwards not even a silver spoon was to be met with in the best houses." "It was very refreshing," adds Livingston, "to remark that after we came to a quarter at night, there was nothing to be heard almost through the whole army but singing of psalms, prayer, and reading of the Scriptures by the soldiers in their several tents; and I was informed there was much more the year before, when the army lay at Dunse Law. And indeed, in all our meetings and consultations, both within doors and in the fields, always the nearer the beginning there was so much the more dependence upon God, and more tenderness in worship and walking; but through process of time we still declined more and more."

General Leslie crossed the Tweed on the 20th of August with his army in three divisions; the College of Justice's troop of horse, consisting of 160 gentlemen, under Sir Thomas Hope, riding on the right wing in order to break the stream for the foot; all of whom got safely through but one man, who was drowned. In their march the officers of the Scottish army were greatly embarrassed by a fear of offending the English nation, with which they had no quarrel, and with which they knew well they were not able to contend. With all the difficulties imposed on him by his situation, however, Leslie continued his march till the 28th, when he completely defeated the king's troops, who had been sent to defend the fords at Newburn. This success put him in possession of Newcastle, Tynemouth, Shields, and Durham, together with several large magazines of provisions, and again reduced Charles to the last extremity—a crisis which ultimately produced the treaty of Ripon, afterwards transferred to London. The king had now, however, the parliament of England upon his hands, and was less occupied with Scottish affairs than formerly. Ten months elapsed before the English parliament saw fit to allow the treaty to be concluded, the Scottish army being all the time quartered in Newcastle, that they might be at hand to assist, in case of matters coming to extremities between the king and the lords

of St. Stephen's Chapel. Embarrassed and controlled by his parliament, Charles now attempted to conciliate the Scots by conceding to them all their demands; hoping thereby to engage them to take part with him against the former. With this view he came himself to Scotland in the month of August, 1641, when, passing through the Scottish army at Newcastle, he was received with the utmost respect, and entertained by the general, who was created Lord Balgonie, and on the 11th of October, 1641, Earl of Leven by patent to him and his heirs whatsoever. In the following year the earl was sent over to Ireland in command of the forces raised for suppressing the rebellion there. In the next year he was recalled to take the command of the forces sent into England to the assistance of the parliament, in pursuance of the Solemn League and Covenant. He commanded the left of the centre division of the parliamentary forces at the battle of Marston Moor, and was driven out of the field, though the honour of his own name and that of his country was gallantly sustained by David Leslie, whose valour contributed in a great degree to the victory there obtained. He afterwards, assisted by the Earl of Calander, took the town of Newcastle by storm; but treated both the town and the garrison with lenity. The king having made overtures to the Scottish generals, Leven sent a copy of them to the parliament, which in return awarded him a vote of thanks, accompanied by a present of a piece of plate. He now laid siege to Harford, but being left by David Leslie, who had marched with all the horse into Scotland to oppose Montrose, and the king approaching in great force, he raised the siege, and marched northward. He was appointed to command, at the siege of Newark, an army composed of both Scottish and English troops, where the king came to him privately on the 5th day of May, 1646. He was afterwards one of a hundred officers who on their knees besought his majesty to accept the propositions offered him by the parliament, and thus be merciful to himself and to the nation. When the engagement for the king's rescue was entered into, the Earl of Leven resigned the command of the army in disgust, pleading the infirmities of old age. On the failure of that project he was again restored to the place he had so honourably filled; but before the battle of Dunbar he again resigned on account of his great age, but appeared in the field as a volunteer. The year following, at a meeting of some noblemen for concerting measures in behalf of Charles II. at Eliot in Angus, he was, along with the rest, surprised by a detachment from the garrison of Dundee, carried to London, and thrown into the Tower. At the request of Christina, Queen of Sweden, he was liberated, had his sequestration taken off, and no fine imposed upon him. He returned to Scotland in the month of May, 1654, and shortly after went to Sweden, to thank Christina for the favour she had done him by interceding with Cromwell on his behalf. How long he remained in Sweden is not known; but he died at Balgonie on the 4th of April, 1661, at a very advanced age. He was buried on the 19th of the same month in the church of Markinch. Few men have been more fortunate in life than Alexander Leslie, Earl of Leven. He appears to have entered upon its duties without fortune and with a scanty education, and by the force of his talents, seconded by habits of religion and persevering industry, raised himself to the highest honours which society has to confer, both in his own and in foreign countries. His services were at the time of immense value to his country, and would have been much more so, had they not been shackled by the pre-

judices, the prepossessions, and the ignorance of those whom the circumstances of birth placed over him as directors. His lordship acquired extensive landed property, particularly Inchmartin in the Carse of Gowrie, which he called Inchleslie. He was twice married: first to Agnes, daughter of Renton of Billy in Berwickshire, and by her had two sons, Gustavus and Alexander, the latter of whom succeeded him as Earl of Leven, and five daughters. After the death of his first wife, which took place in 1651, he married Frances, daughter of Sir John Ferriars of Tamworth in Staffordshire, relict of Sir John Parkington, Baronet of Westwood, in the county of Worcester, by whom he had no issue. His peerage finally became merged by a female with that of Melville, in conjunction with which it still exists.

LESLIE, DAVID, a celebrated military commander during the civil wars, and the first Lord Newark, was the fifth son of Patrick Leslie of Pitcairly, commendator of Lindores, by his wife, Lady Jean Stuart, second daughter of Robert, first Earl of Orkney. Of his early life little more is known than that, like many others of his countrymen, he went into the service of Gustavus Adolphus, King of Sweden, where he distinguished himself by his military talents, and attained to the rank of colonel of horse. Returning from the Continent at, or shortly after, the commencement of the civil wars, he was appointed major-general to the army that was sent into England under the command of the Earl of Leven to the assistance of the parliament. This army, which marched for England in the month of January, 1644, after suffering greatly from the state of the roads and want of provisions, joined the parliamentary forces at Tadcaster, on the 20th of April, with whom they were united in the siege of York, which was raised on the night of Sunday, the 30th of June, by the advance of Prince Rupert, with all the strength of the royal army. Determined to give him battle, the confederates took post on Marston Moor, on the south side of the Ouse, about five miles distant from the scene of their former operations. Here they hoped to have interrupted the march of the prince towards the city, which he was desirous of gaining; but permitting their attention to be engrossed by a party of horse which he despatched for this purpose, to contest the passage of a river, he in the meantime succeeded in throwing the whole of his army into the town. His immediate object thus gained, he was advised by his colleague, the Marquis of Newcastle, to rest satisfied till he should receive reinforcements, or till the dissensions which now appeared among the confederates should rise to such a height as to destroy the unanimity of their proceedings. Rupert, however, was not of a disposition to wait for remote contingencies when he conceived the chances to be already in his favour; he therefore hastened to Marston Moor, the position the enemy themselves had chosen, and came upon their rear when they were already on their march for Tadcaster, Cawwood, and Selby, by occupying which they intended to cut off his supplies, and to hem him in till the arrival of additional forces should render his capture easy, and his escape impossible. The Scottish troops in advance of the army were already within a mile of Tadcaster, when about nine o'clock of the morning of the 22d of July, 1644, the alarm was given that Prince Rupert's horse, to the number of 5000, were pressing on the rear of the confederates, while the main body of his army occupied the moor which they had just left. The march was instantly countermanded, and preparations for an engagement made with the least possible delay. The prince,

however, having full possession of the moor, they were compelled to draw up part of their troops in an adjoining field of rye, their right bearing upon the town of Marston, and their line extending about a mile and a half fronting the moor. By three o'clock in the afternoon both armies, amounting to 25,000 men each, were formed in order of battle. The royal army was commanded on the right by Prince Rupert in person; on the left by Sir Charles Lucas, assisted by Colonel Harvey; while the centre was led by Generals Goring, Porter, and Tilyard. The Marquis of Newcastle was also in the action, but the place he occupied has not been ascertained. The parliamentary army was composed on the right of horse, partly Scottish, commanded by Sir Thomas Fairfax; on the left, likewise horse, by the Earl of Manchester, and Cromwell his lieutenant-general, assisted by Major-general David Leslie; and in the centre by Lord Fairfax and the Earl of Leven. The battle commenced with a discharge of great guns, which did little execution on either side. A ditch, separating the combatants, rendered the assault a matter of difficulty and peculiar danger, and both stood for some minutes in breathless expectation waiting the signal for attack. On that signal being made, Manchester's foot and the Scots of the main body in a running march cleared the ditch, and advanced boldly to the charge, accompanied by the horse, who also rushed forward to the attack. The fiery Rupert with his squadrons instantly advanced upon the no less fiery, but far more cautious, Cromwell. The conflict was terrible; every individual, being under the eye of his leader, exerted himself as if the fate of the day had been intrusted to his single arm. The troops of Cromwell, however, supported by David Leslie and the Scottish horse, charged through the very flower of the cavaliers, putting them completely to flight, while Manchester's foot, keeping pace with them, cut down and dispersed the infantry. The Marquis of Newcastle's regiment alone disdained to flee, and their dead bodies, distinguished by their white uniforms, covered the ground they had occupied when alive. On the other extremity of the line Sir Thomas Fairfax and Colonel Lambert, with a few troops of horse, charged through the royal army, and met their own victorious left wing. The remainder, however, were completely defeated, and even Fairfax's victorious brigade was thrown into confusion by some new raised regiments wheeling back upon it, and treading down in their flight the Scottish reserve under the Earl of Leven, who, driven from the field, fled to Tadcaster, carrying with them the news of a total defeat. Cromwell, Leslie, and Manchester, perceiving the rout of their friends, returned to the field as the victors were about to seize upon the spoil. The fate of the day was now reversed. The royal troops occupied the field of rye, and the parliamentary forces the moor. Each, however, determined if possible to preserve the advantage they had gained, and both once more joined battle. The struggle now, however, though bloody, was short and decisive. The shattered remains of the royal army sought shelter in York; leaving all their baggage, artillery, military stores, and above a hundred stand of colours, in the hands of the conquerors. Upwards of 3000 men were left dead on the field; and upwards of 1500 prisoners—more than 100 of whom were principal officers—fell into the hands of the conquerors. This victory was the death-blow to the affairs of the king, and greatly added to the reputation of Cromwell and Leslie, between whom the whole merit of the affair was divided; the Independents claiming the largest share for Cromwell, and the Presbyterians for Leslie. The combined

army immediately laid siege to York, which surrendered by capitulation in a few days. The confederates, after the capture of York, separated; the Scottish troops marching northward to meet the Earl of Callander, whom they joined before Newcastle in the month of August.

General Baillie, in the meantime, had been recalled from England to command the raw levies that were raised for the defence of the country; but he was accompanied in his progress by a committee of the estates, who controlled all his movements; and, contrary to the opinion of the general himself, commanded him to leave a strong position and expose himself with an army of inexperienced soldiers to certain destruction on the fatal field of Kilsyth, August 15th, 1645. The issue of this battle left the kingdom entirely in the power of Montrose and his army. In this emergency David Leslie, with the whole of the cavalry attached to the Scottish army, then lying before Hereford, was recalled. Arriving at Berwick, whither the estates had fled from the plague, which was then raging in Edinburgh, Leslie took measures for cutting off the retreat of Montrose to the north, amongst whose mountains he had formerly found refuge. For this purpose he proceeded as far as Gladsmuir, about three miles to the west of Haddington, where he learned that Montrose was lying secure in Ettrick Forest, near Selkirk. Leslie was no sooner apprised of this than he wheeled to the left, and marched southward by the vale of Gala. The darkness of the night concealed his motions, and the first notice Montrose had of his approach was by his scouts informing him that Leslie was within half a mile of him. A sanguinary encounter soon followed; but Montrose's troops, though they fought with a desperation peculiar to their character, were completely broken and driven from the field, leaving 1000 dead bodies behind them. Their leader, however, had the good fortune to escape, as did also the Marquis of Douglas, with the Lords Crawford, Sir Robert Spotswood, A. Leslie, William Rollock, Erskine, Fleming, and Napier. The Lords Hartfield, Drummond, and Ogilvy, Philip Nisbet, William Murray (brother to Lord Tullibardine), Ogilvy of Innerquharie, Nathaniel Gordon, Andrew Guthrie (son to the Bishop of Moray), and two Irish colonels, O'Kean and Lauchlin, were made prisoners, and reserved for trial in the castles of Edinburgh and Stirling. Upwards of 100 Irish soldiers taken were, in conformity to a decree of the legislatures of both kingdoms, shot upon the field.

Leslie now proceeded with his victorious army to Lothian, and from thence, accompanied by the committee of estates, to Glasgow, where, in conjunction with the committee of the church, they deliberated on the measures necessary for completing the reduction of Montrose, and securing the internal peace of the kingdom. Some of the prisoners taken at Philiphaugh were here tried and executed; and as a mark of gratitude, the committee, out of a fine they imposed on the Marquis of Douglas, voted to Leslie 50,000 merks, with a gold chain, and to Middleton, who was second in command, 30,000. Montrose, restless and intriguing, in the meantime wandered from place to place, endeavouring to raise a new army. Leslie now returned to his station in the Scottish army under the Earl of Leven, whom he joined in the siege of Newark-upon-Trent. It was here that Charles, baffled in all his projects, came into the Scottish camp a helpless fugitive, on the 5th of May, 1646. He was received with great respect, the commander-in-chief, the Earl of Leven, presenting him with his sword upon his knee. On the return of the Scottish army it was reduced to about

6000 men, of whom Leslie was declared lieutenant-general, with a pension of £1000 a month over and above his pay as colonel of the Perthshire horse. With this force Leslie proceeded to the north, where the Gordons still kept up a party for the king. These men, who had been so formidable to Argyle, Hurry, and Baillie, with the parliamentary commissioners, scarcely made the shadow of resistance to Leslie. He seized upon all their principal strengths, and sent their leaders prisoners to Edinburgh. The lives of the inhabitants, according to his instructions, he uniformly spared; but upon the Irish auxiliaries he as uniformly did military execution. Having gone over the northern districts, and secured every castle belonging to the disaffected, he left Middleton to garrison the country, with instructions to seize upon the person of Huntly, who had taken refuge among the hills. These arrangements made, he passed into the peninsula of Kintyre, to look after Montrose's colleague, Alaster M'Coll. This chieftain, after making some ineffectual resistance, took to his boats with his followers, and sought safety among the western isles, leaving his castle of Dunavertie to the care of a body of Irish and Highlanders, to the number of 300 men. As this force, however, was wholly inadequate to the defence of the fort, it was taken, and the garrison put to the sword. Alaster himself was pursued by Leslie, with eighty soldiers, to his castle in Isla. He had, however, fled to Ireland, leaving 200 men under the command of Colkittoch, his father, to defend his castle of Dunavey. This stronghold Leslie also reduced, the garrison having surrendered, on condition of having their lives spared, but to be sent to serve under Henry Sinclair, a lieutenant-colonel in the French service. Colkittoch, being given to the Campbells, was hanged. Having gone over the other islands with the same success, Leslie returned to the low country in the month of September, where he was honoured with the approbation of his party for the fidelity, diligence, and success with which he had executed his commission. The king, in the meantime, had been delivered up to the English parliament, and passed through that series of adventures which ended in his taking refuge in the Isle of Wight. When the Duke of Hamilton in 1648 raised an army of moderate Scottish Covenanters, to attempt the rescue of his royal master, Leslie was offered the command; but, the church being averse to the undertaking, he declined accepting it. After the duke had marched on his unfortunate expedition, the remaining strength of the country was modelled into a new army under the less moderate Covenanters, and of this the Earl of Leven was appointed commander, and David Leslie major-general, as formerly. Immediately after the death of Charles I., when the cavaliers rose in the north for his son, in what was called "Pluscardine's Raid," Leslie sent a party against them in the month of May, 1649, under the command of Charles Ker, Hacket, and Strahan, by whom they were totally dispersed. On the resignation of the Earl of Leven, Leslie was appointed to the chief command of the army raised on behalf of Charles II., after he had accepted the covenant, and been admitted to the government. In this situation he showed himself an able general, repeatedly baffling by his skill the superior forces of Cromwell, whom he at last shut up at Dunbar; and but for the folly of the church and state committee, which had been the plague of the army during all the previous troubles, had undoubtedly cut off his whole army. Yielding to the importunities of this committee, he rashly descended from his commanding position, and was signally defeated on the 3d of September, 1650.

Upwards of 3000 men were left dead on the field, 10,000 were taken prisoners, 200 colours, 15,000 stand of arms, with all the baggage and artillery, fell into the hands of the English. Leslie, with the wreck of his army, retired upon Stirling, and again made such dispositions for defending that important line of defence as Cromwell found himself unable to force. Here he was joined by Charles, who himself assumed the command of the army, having the Duke of Hamilton and Leslie for his lieutenants. In this capacity Leslie accompanied the king to Worcester, where, on the 3d of September, 1651, Cromwell completely routed the royal army. Leslie was intercepted in his retreat through Yorkshire, and committed to the Tower of London, where he remained till the Restoration in the year 1660. By Cromwell's act of grace he was fined in £4000 in the year 1654. After the Restoration he was created, in consideration of his services and sufferings in the royal cause, Lord Newark, by patent dated the 31st of August, 1661, to him and the heirs male of his body lawfully begotten, with a pension of £500 per annum. His lordship, however, does not seem to have been without enemies, as the following letter from the king, assuring him of his unabated confidence, sufficiently implies:—"Although we have, on all occasions, both abroad and since our happy return, declared ourself fully satisfied with your conduct and loyalty in our service, and although, in consideration of the same, we have given you the title and honour of a lord; yet, seeing we are told that malice and slander do not give over to persecute you, we have thought fit to give you this further testimony, and to declare under our hand, that while you was the lieutenant-general of our army, you did, both in England and Scotland, behave yourself with as much conduct, resolution, and honesty as was possible or could be expected from a person in that trust: and as we told you, so we again repeat it, that if we had occasion to levy an army fit for ourself to command, we would not fail to give you an employment in it fit for your quality." His lordship died in the year 1682. He married Jean, daughter of Sir John York, by whom he had a son, David, who succeeded him as Lord Newark, and three daughters; the eldest of whom, Elizabeth, was married to Archibald Kennedy of Cullen, and was mother to Susanna, the celebrated Countess of Eglintoune.

LESLEY, GEORGE, of Monymusk, a Capuchin friar of the earlier part of the seventeenth century. The introduction of this individual as an illustrious Scotsman, and the manner in which we intend to treat the events of his life, require some explanation. John Benedict Rinuccini, Archbishop of Fermo, published in Italian the life and marvellous adventures of his friend George Lesley, a Scotsman of rank, who had been miraculously converted to the Roman Catholic faith.¹ A work on so pleasing a subject did not remain long in obscurity; it was translated into French, in which language it was published at Rouen in 1660, at Paris in 1682, and again at Rouen in 1700. In 1673 it was dramatized at Rome, and the decent inhabitants of Monymusk, a remote hamlet in Aberdeenshire, were clothed in names suited for an audience in the imperial city; such as Lurcanio a Calvinist clergyman, the parish minister of Monymusk; Forcina, his servant; Theophilus, an old cottager; besides an angel, Pluto, and

Beelzebub, in the form of Calvin.² The work, even in its primitive form, is a pure romance, manufactured for the laudable purpose of supporting the holy Catholic church; while in the midst of the absurd topography, and still more absurd displays of character, it is evident from names and circumstances, that the whole is founded on fact, and that George Lesley must have been a man remarkable for enthusiasm, eccentricity, villany, or some other qualification on which it is difficult to determine. There have already been published two abridged translations of his life, one by Lord Hailes in his *Sketches of Scottish Biography*, the other in the *Scots Magazine* for 1802. A search into such contemporary records as we thought might throw any light on the real adventures and merits of this wonderful man, has proved vain; and, unable to separate the truth from the falsehood, we are compelled to follow the steps of those who have already treated the subject by giving an abridgment of the French translation, without omitting any of its marvels.

The author commences with an account of the city of Aberdeen, which, as we know it to be incorrect, and can "separate the truth from the falsehood" in it, we omit. In its neighbourhood lived James Count Lesley, and Jean Wood his wife, the father and mother of George, who received from them all the treatment of a beloved son, with the exception, that along with his mother's milk he sucked in the dawning doctrines of Calvinism. Count Leslie died soon after the birth of his son, leaving him vast wealth, and the lady afterwards married the baron de Torry.³ In his eighth year the young count was sent to pursue his studies in France, with a train and equipage suited to his rank, a heretic preceptor, and a fund of advice steadfastly to maintain the faith he had been taught. He applied diligently to his studies, and became acquainted with two noble Parisian brothers, whose society, contrary to the usual expectation of the world regarding such associates, confirmed him in his studious disposition, and, like St. Basil and St. Gregory Nazianzen, he knew no other street in Paris save that which communicated with their house and the school. The Parisian youths, compassionating the state of their companion's soul, proceeded to effect his conversion, in which they were assisted by their father, who, instead of the ordinary method of balancing the doctrines of the two religions with each other, appears to have merely contrasted Calvinism, the affection of his relations, and eternal damnation, with the Catholic faith, eternal felicity, and the loss of his near relations. The discussions were conducted at the old gentleman's country-house, beneath the shadow of an oak, and as a recreation from the pastimes of hunting and fishing. The effect of the whole was irresistible; young Lesley submitted to become a member of the holy Catholic church, and was immediately conducted to a confessional, after which his companions beheld in his face a glimpse of that glory which formerly appeared in the face of Moses. Meanwhile the heretic preceptor was naturally displeased with what he saw; he argued, and threatened, and represented the grief of the young count's mother, but in vain. He then sent an account of the matter to Monymusk, and the lady in great trepidation demanded the return of her son; but he, anxious for the safety of his new faith, declined, and

¹ Not having been so fortunate as to meet with a copy of the Italian edition, we cannot give a copy of the title-page, or even of the date.

³ Probably the laird of Torry, a village near Aberdeen.

the enraged parent disowned him. "Alas!" groans the archbishop, "to what an extent will bigotry drive us in matters of religion." The young count, who had now reached the mature age of sixteen, put himself under the protection of his new friends, and accompanied them on a pilgrimage to Loretto. Here he formed an acquaintance with the Capuchin fathers of St. Francis, and particularly with Ange Joyeuse, a noble Frenchman, who had exchanged rank and wealth for the cord of St. Francis. On the departure of his friends he intimated his intention of remaining at Rome to prepare for the conversion of his miserable family; he expressed a desire to enter the fraternity of St. Francis, but was horrified to discover that certain bulls prohibited the reception of newly-converted heretics. The ingenuity of his friend Ange attempted to relieve him from this dilemma. It was represented that there was a rational distinction betwixt heretics in a Catholic country and the children of Huguenots, who had no means of knowing the true faith. The distinction, however, was not satisfactory to the general of the order, and Lesley formed the bold design of bursting into the papal presence, and enforcing his request. When the youth lifted up his adoring eyes, to look at the countenance of the viceregent of God, the whole chamber beamed with a dazzling light, more luminous than the sun, the brighter rays of light being there accumulated to form a tiara for the majesty of the sacred head;—a phenomenon which we are confidentially assured by the biographer always attends the pontifical presence, although it is not often visible to the naked eye. By the intervention of the pope he was received into the order, and became a Capuchin, and assuming the ecclesiastical name of Archangel, he preached with edification. Twenty years had elapsed since his departure from Scotland, when his mother, hearing that he had disgraced his family by joining a fraternity of beggars, at first (according to the charitable presumption of the archbishop) wished to assassinate him, but preferred the more humane alternative of sending her second son, the Baron of Torry, to convert him. It would be tedious to tell how the brothers met, and how the reverse of what was expected took place, by the baron joining the true faith, and both forming a project for the conversion of their mother and the other inhabitants of Scotland. The baron was the first to return to Scotland, and accident soon revealed the change in his faith; in the meantime Lesley was chosen Capuchin preacher at the court of Mary of Medicis, Queen-regent of France, and on the institution of the college *de propaganda fide*, by Gregory XV., he was appointed papal emissary to Scotland, to procure the restoration of that lost land to the true faith, at the same time accepting the additional situation of interpreter to the Spanish ambassador in England. Lesley, or as his biographer at this period commonly terms him, Archangel, wrote a letter to his mother, which with much discretion he delivered himself. He was received with considerable cold politeness, and entertained in the castle; where, however, he could not eat his dinner in peace from being compelled to sit beside a heretic clergyman, who pocketed 300 crowns annually for teaching the doctrines of damnation, to whom, says his author, whenever he turned his eyes, he thought the banquet assumed the aspect of a funeral meal. Archangel kept his secret about six days, when a remark which he made connected with a change in the establishment, proved him not to be a stranger, and he was compelled to make himself known. The rejoicings at this event can scarcely be described in words. The old lady received *thousands* of visits of congra-

tulation, the fame of the event reached even to Aberdeen (about twenty-five miles), fires of rejoicing were lighted up on the castle of Monymusk,¹ and the inhabitants of the town² discharged culverins and let off sky-rockets. He commenced a vigorous discharge of the duties of his mission; he led the people to an adjoining mountain, where he had not been preaching half a quarter of an hour, when the people shuddered, changed colour, and knelt at his feet—he converted 4000 to the true faith in eight months. He now naturally turned his eyes towards the salvation of his mother, to which he was resolved to make his way through the heretical priest. The reverend gentleman at first declined any discussion, but he was at length compelled to come to issue. He was asked what was the denomination of his peculiar faith, and with much simplicity answered, it was the church of Geneva. Archangel then asked if the church of Geneva was ever mentioned in Scripture? this was a home-thrust to the minister, who had seen no more in Scripture about the church of Geneva than about the stipend of Monymusk. Like a prudent man, however, he promised to produce what was wanted if he could get time; but after repeated delays having failed, Archangel triumphantly pointed to the epistle to the Romans as a proof of the existence of his church; the heretic was dismissed for incapability and error, and his mistress' faith ceded to the victor. The conversion of the mother was followed by that of the other members of the family and the whole establishment of the castle. A splendid chapel was fitted up for the celebration of the rites of the Roman Catholic church, and the object of the mission made rapid progress for two years, at the end of which period one of King James' edicts against Roman Catholics compelled Archangel to retire to England, and there prosecute his mission in secrecy, having been compelled to leave his books and papers as a prey to the enemy. His mother's goods were confiscated, and she was reduced to the utmost misery by Protestant persecution. In these circumstances her son resolved to visit her, and dressing himself as an itinerant vender of herbs, passed through the streets of Monymusk, vociferating "Buy my greens;" he obtained an interview with his mother, who was reduced to the necessity of being compelled to purchase some of his commodity, and a scene ensued, which our limits will not permit us to describe. Being interrupted in his visit by the Protestant "inquisitors," he was compelled to return to England, whence he was summoned to Italy to attend the head of his order, on the ground of some alleged malversation, the cause of which is not very lucidly explained. The plague raged in Italy during his journey, and he for some time occupied himself in attending the sick at Cremona. He was then appointed guardian of the convent of Mount George in the diocese of Fermo. Here he became acquainted with the archbishop who has so lucidly written his memoirs, and through a mutual miracle a second mission to Britain was concocted between them. Archangel set out, accompanied by another Scottish Capuchin called Epiphane; their vessel was overtaken by a violent storm, and after a few amiable discussions about tossing overboard some useless hands, in order to lighten her, she was wrecked, the two Capuchins being miraculously saved, along with some passengers, among whom were two English gentlemen, whom Archangel converted by the following comfortable argument: "*We hold that you cannot be saved, you admit that we may; judge, then,*

¹ The castle of Monymusk is a neat old Flemish building, which would make a rather diminutive modern mansion.

² The hamlet of Monymusk contains about fifty inhabitants.

which is the safest religion."¹ He after this met a young Scotsman, who gave him the pleasing intelligence, that, notwithstanding the persecutions suffered by the true faith in Scotland, one influential family in the neighbourhood of the *large* town of Monymusk had been spared, the influence of the King of France having procured the restoration of their estates, and permission to exercise their religion. This gentleman turned out to be his younger brother Edward, from whom he learned also the sad intelligence that their mother had fallen into a fever, and died, from the dread that her son had been drowned in his voyage. After this many adventures happened to Archangel, among which some too curious remarks made by him on the fortifications of Newport caused his apprehension as a spy. His zeal not decreasing, he wore out the patience of the monarch, and becoming again amenable to the laws against Papists, was commanded to quit the kingdom. On his journey southward he made many miraculous conversions, and particularly on the persons of noblemen in the neighbourhood of the city of Torfecan (Torphichen). While near the borders of England, his exertions produced a fever, of which he died, and a Jesuit in the neighbourhood performed over him the last offices of charity. So terminate the adventures of Le Capuchin Ecossois, of which we are sorry we are compelled to omit many choice portions.

LESLIE, JOHN, Bishop of Clogher, was born at Balquhain, in the north of Scotland, after the middle of the sixteenth century. He was of an ancient and highly respectable family. The earlier part of his education he received at Aberdeen, the latter part at Oxford. He afterwards travelled into Spain, Italy, Germany, and France, and acquired such a proficiency in the languages of all these countries, excepting the last, that he spoke them with the fluency of a native. In the Latin language he particularly excelled, and was so familiar with it, that it was said of him in Spain when he resided there, *Solus Lesleius Latine loquitur*. He remained on this occasion twenty-two years abroad, and during that time was present at the siege of Rochelle. He also accompanied the Duke of Buckingham on the expedition to the Isle of Rhé.

Leslie stood high in favour with Charles I., and was by that monarch admitted a member of his privy-council. In 1633 he was appointed to the bishopric of Raphoe, in Ireland, where he built a handsome palace. This building he afterwards held out against Cromwell, adopting the loyal alternative of enduring a siege rather than submit to the usurper.

On the death of his royal patron he went abroad, where he remained till after the Restoration. He then returned to England, and in 1661 was translated to the see of Clogher. Here he remained till his death, which took place in 1671, when he was upwards of one hundred years of age. He was then the oldest bishop in the world, having filled that dignified station for fifty years.

LESLIE, CHARLES, a celebrated non-juring divine, was the second son of the Bishop of Clogher. He was born in the year 1650. He commenced his education at Inniskillen, Ireland, and was admitted a fellow-commoner in Trinity College, Dublin, in 1664. Here he continued till he commenced Master of Arts, and during this period acted as tutor to Mr. Michael Ward, afterwards Bishop of Derry. After the death of his father in 1671, he came over to

England, and entered himself in the Temple at London, and for some years studied the law. Finding this an uncongenial pursuit, he relinquished it and applied to divinity. In 1680 he was admitted into holy orders, and in 1687 became chancellor of the cathedral church of Connor, and also acted as a justice of the peace. Soon after his appointment he distinguished himself in a public religious controversy with Patrick Tyrrel, a Roman Catholic, who had been appointed to the see of Clogher. The disputation was numerously attended by persons of the persuasions of both the champions, and each assigned the victory to the defender of his own faith; but it is beyond doubt that Leslie had greatly the advantage of his antagonist. He afterwards held another public disputation with two eminent Popish divines in the church of Tynan, diocese of Armagh. The controversy was maintained in the presence of a large assembly, composed, as in the former case, of persons of both religions; and here again the talents of Leslie brought him off triumphantly. He was now become exceedingly popular in the country for his theological acquirements, and a circumstance soon afterwards occurred which procured him equal celebrity for his political knowledge, and for his intrepidity of character. A Roman Catholic high-sheriff having been appointed for the county of Monaghan, the gentlemen of the county, in great alarm at this indication of Catholic ascendancy, hastened to wait upon him for his advice as to how they should act with regard to the newly-appointed officer, whose religion disqualified him by law for the situation. Mr. Leslie told them that it would be equally illegal in them to permit the sheriff to act, and in him to attempt it; that though appointed by the authority of the crown, he, being of the Roman Catholic persuasion, could not have taken the oaths necessary to qualify him for the office, and that therefore his nomination was illegal. This doctrine he afterwards held at the quarter-sessions, where the case came to be decided, and so effectually did he urge his objections, and that in the presence of the sheriff himself, that the bench unanimously agreed to commit the pretended officer for his intrusion. Mr. Leslie thus placed himself in conspicuous opposition to the dominant party, and openly declared that he no longer considered James as the defender of the faith.

Notwithstanding, however, of his hostility to the Papists, he continued a staunch supporter of the exiled family at the revolution in 1688, and refused to take the oaths to King William and Queen Mary. The consequence of this fidelity was the loss of all his preferments.

When Ireland became disturbed in 1689, Mr. Leslie removed with his family to England, where he employed himself in writing political pamphlets to serve the cause which he had embraced; but though opposed to the existing government, he continued a zealous and active supporter of the Church of England. About this time he entered into a controversy with the Quakers, which is said to have arisen from the circumstance of his lodging with a family of that persuasion. This family he converted. The first of the several treatises which he wrote against the Quakers is entitled *The Snake in the Grass*. It appeared in 1696, and soon ran into a second edition. It was answered by George Whithead, in a pamphlet entitled *An Antidote to the Snake in the Grass*. In his second edition Mr. Leslie noticed this answer; but he was again assailed in a production called *Satan Dissolved from his Disguises of Light*, which also appeared in 1696. To this and several other attacks Mr. Leslie replied at great

¹ A favourite argument with Roman Catholics, to which Jeremy Taylor made a well-known and unanswerable answer. VOL. II.

length, in *A Defence of a Book entitled the Snake in the Grass*. This again provoked a host of answers, amongst which was one by the Quakers entitled *A Switch for the Snake*. To this Mr. Leslie again replied, in *A Second Defence, or the Third and Last Part of the Snake in the Grass*.

The most celebrated works of Mr. Leslie, though these just enumerated discovered singular ability, were those which he wrote against the Deists. The first of these was published in 1697 in a letter to a friend, and was entitled *A Short and Easy Method with the Deists*. The friend alluded to in the title was a lady, though the work bears that it was a gentleman. Having been thrown accidentally into the company of infidels, she applied to Mr. Leslie for "some short topic of reason, without running to authorities and the intricate mazes of learning." The treatise was effectual, and Mr. Leslie, although it was not his original intention, was prevailed upon to publish it. This work he enlarged considerably in a second edition. No answer appeared to the *Short and Easy Method* till 1710, when it was replied to in a treatise entitled *A Detection of the True Meaning and Wicked Designs of a Book entitled, &c.* Mr. Leslie replied to this attack in *The Truth of Christianity Demonstrated*, to which was prefixed *A Vindication of the Short Method with the Deists*. These works against Deism produced a powerful effect, and amongst others the conversion of a person of the name of Gildon, who had acquired considerable celebrity as a member of that persuasion. This man not only professed himself convinced of his errors, and publicly retracted them, but wrote a book against the opinions which he had formerly entertained, entitled *The Deist's Manual, or a Rational Inquiry into the Christian Religion*.

Encouraged by the success of his attack on Deism, Mr. Leslie in 1699 produced his *Short Method with the Jews*, a work which was first suggested by a similar circumstance with that which had given rise to his *Short Method with the Deists*. An eminent Jew had been converted by his reasoning, and had intimated his intention of publicly owning his conviction. The convert, however, died during Mr. Leslie's absence, without exhibiting the recantation which he had proposed.

The next controversy in which Mr. Leslie was engaged was with the Socinians. It began in 1694. In 1697 he published the first of the six dialogues, entitled *The Socinian Controversy Discussed*. This was answered in a short tract, entitled *Remarks on Mr. Charles Leslie's First Dialogue on the Socinian Controversy*. Mr. Leslie replied, and was again answered by his opponent in *A Vindication of the Remarks*. Mr. Leslie now published *A Reply to the Vindication*, and with this ended the first part of the controversy.

His principal works against the Papists were, "*The True Nature of the Catholic Church*, in answer to the Bishop of Meaux's Letter to Mr. Nelson," printed in 1703; *The Case Stated between the Church of Rome and the Church of England*, published in 1713; and *Of Private Judgment and Authority in Matters of Faith*. These works are said to have made several converts from Popery.

Although thus earnestly and laboriously employed in the cause of religion, Mr. Leslie did not neglect the interests, so far as any efforts of his could serve them, of the exiled family. He wrote several political tracts during this period, and made several journeys to Bar le Duc, to visit the Pretender, who was then residing there. These journeys, however, and his political treatises, especially one entitled *The Good Old Cause*, published in 1710, gave such

offence to the ruling party, that it is said a warrant for his apprehension was actually issued against him. However this may be, he found it necessary to quit the kingdom in 1713, when he proceeded to Bar le Duc, and took up his residence by invitation with the Pretender, who procured a room to be fitted up for him in his own house. While here Mr. Leslie was permitted to officiate in a private chapel after the manner of the Church of England, and it is even said that the Pretender had promised to listen to his arguments concerning his religion, and that Mr. Leslie had in vain endeavoured his conversion. This, however, is contradicted by Lord Bolingbroke, who asserts that he not only refused to listen to Mr. Leslie, but forbade all discussion on religious matters. Notwithstanding of this, however, and of several other subjects of dissatisfaction with the Chevalier, whose conduct towards him does not appear to have been altogether adjusted to his deserts, Mr. Leslie continued to remain with him, and in 1716 accompanied him into Italy after his unsuccessful attempt upon England. Here he remained till 1721, when he found his situation so exceedingly disagreeable that he determined on returning to his native country. This he accomplished, but died in the following year, on the 13th April, in his own house at Glaslough, in the county of Monaghan.

The list of Mr. Leslie's works, political and theological, is exceedingly voluminous. The theological works, in seven volumes, were printed in 1832 at the Oxford university press.

LESLIE, JOHN, Bishop of Ross, and distinguished for his indefatigable exertions in behalf of Queen Mary, was born in 1526, being the son of Gavin Leslie, an eminent lawyer descended from the Barons of Balquhain, one of the most respectable branches of the ancient family of Leslie. He received his education at the university of Aberdeen, and in 1547 was made canon of the cathedral church of that diocese. He subsequently pursued his studies in the universities of Toulouse, Poitiers, and Paris, at which last place he took the degree of Doctor of Laws. In 1554 he was ordered home by the queen-regent, and made official and vicar-general of the diocese of Aberdeen. In the turmoil of the Reformation, which soon after commenced, Leslie became a noted champion of the Romish faith, and appeared on that side in the famous disputation at Edinburgh in 1560. When it was resolved to bring over the young queen from France to assume the government of her native country, Leslie was the chief deputy sent to her by the Catholics, to gain her exclusive favour for that party; but though he had the dexterity to arrive before the Protestant deputation, he was not successful. Leslie, however, returned to Scotland in the queen's company, and was appointed by her a privy-councillor and one of the senators of the College of Justice. In 1564 the abbey of Lindores was conferred upon him, and he was soon after promoted to the bishopric of Ross; offices catholic in form, but which now referred to little more than certain temporalities to which they conferred a title. Leslie was one of the sixteen commissioners appointed in this reign to revise the Scottish laws, and it was chiefly owing to his care that the volume of the acts of parliament, usually called the Black Acts, from its being printed in the old English character, was given to the world in 1566.

The name of the Bishop of Ross derives its chief lustre from the steadfastness and zeal with which he adhered to the fortunes of his royal mistress after they had experienced the remarkable reverse which is well known to have befallen them. When Mary

had become an almost hopeless captive in England, this amiable prelate, at the hazard of all his temporal enjoyments, continued to adhere to her, and to exert himself in her behalf, with a fidelity which would have adorned any cause. He was one of her commissioners at the conference of York in 1568; on which occasion he defended her with a strength of reasoning which is allowed to have produced a great impression, though it did not decide the argument in her favour. He afterwards appeared as her ambassador at the court of Elizabeth, to complain of the injustice done to her; and if the English princess had not been a party interested in the detention of his mistress, his solicitations could have hardly failed of effect. When he found that entreaties and appeals to justice were of no avail, he contrived means for the escape of the queen, and planned the project for her marriage to the Duke of Norfolk, which ended in the execution of that unfortunate nobleman. Leslie was examined in reference to this plot, and notwithstanding his privileges as an ambassador, which he vainly pleaded, was committed prisoner, first to the Isle of Ely, and afterwards to the Tower of London. It appears to have been during this confinement that he wrote the historical work by which his name is now chiefly known. In 1573 he was liberated from prison, but only to be banished from England. He then employed himself for two years in soliciting the interference of the continental princes in behalf of his mistress, but without obtaining for her any active assistance. Even with the pope, whom he requested to use his influence with these princes, he met with no better success. While at Rome he published his history in Latin, under the title of *De Origine, Moribus, et Rebus Gestis Sæclorum*. This appeared in 1578: next year, having removed to France, he was made suffragan and vicar-general of the archbishopric of Rouen in Normandy; and while visiting the diocese, was apprehended and thrown into prison, and obliged to pay 3000 pistoles to prevent his being given up to Elizabeth. During the remainder of the reign of Henry III. he lived unmolested; but on the accession of the Protestant Henry IV., who was the strict ally of Elizabeth, he fell again into trouble. In the course of his visitation of the diocese in 1590 he was once more thrown into prison, and forced to purchase his freedom at the same expense as before. In 1593 he was made Bishop of Constance, but being now apparently tired of life, which for many years had presented only disappointments and vexations, he soon after retired into a monastery at Gurtenburg, about two miles from Brussels, where he spent the remainder of his days in tranquillity. He died May 31st, 1596, and lies buried in the monastery, under a monument erected to his memory by his nephew and heir, John Leslie.

Bishop Leslie is generally allowed the praise of great learning and of high diplomatic abilities, though it is almost as generally regretted that he did not turn them to a better use. His fidelity to a declining cause is also allowed, even by its enemies, to have been a sentiment as free from the dross of worldly or selfish views as the motives of a line of public conduct ever are. The isolation of a Catholic church dignitary in society seems favourable to the development of such sentiments; and there are not many cases in which the principle is observed to have been more powerful than in the history of this Scottish prelate. His tongue, his pen, the travel of his body, his temporal fortune, were all devoted with the most generous unreserve to the cause which he thought that of justice and true religion; and what more can any man do to show the superiority of his nature to the meaner passions?

The works of Bishop Leslie are as follow:

1. "*Defence of the Honour of Mary Queen of Scotland*;" with a Declaration of her Right, Title, and Interest to the Crown of England;" Liège, 1571, 8vo, which was immediately suppressed.
2. *Afflicti Animi Consolationes et Tranquilli Animi Conservatio*; Paris, 1574.
3. *De Origine, Moribus, et Rebus Gestis Sæclorum*; Romæ, 1578, 4to.
4. *A Treatise showing that the Regiment of Women is Conformable to the Law of God and Nature*.
5. *De Titulo et Jure Maris Scoticarum Regina; quo Angliæ Successionem Jure sibi vindicat*; Rheims, 1580, 4to.
6. "*The History of Scotland*, from the Death of James I. in 1436 to the year 1561; Edinburgh, 1830, 4to.

The volume last mentioned was printed from a manuscript in the possession of the Earl of Leven and Melville. It is in the Scottish tongue, and forms the original of the three latter books of the Latin history, which differs from it in no respect except in being a little more ample. It appears to have been composed in the vernacular tongue in order that it might be of use to his captive mistress, who, it is to be presumed, was not so good a Latinist as her cousin Elizabeth. The reason of his presenting her with only this detachment of the history of her country was, that the preceding part was already to be had in Bellenden's version of *Boece*. That work stops at the death of James I., and it would naturally occur to Bishop Leslie that a continuation to his own time was a desideratum, both to the people and to her whom he maintained to be their sovereign. He finished his work in March, 1570, and presented the unfortunate queen with the manuscript in 1571; but it never saw the light till the date above mentioned, when 100 copies were printed for the Bannatyne Club, with fifty additional for sale to the public. The style of the work, though it could not fail to sound rudely in the ears of a modern Englishman, is highly elegant and dignified, forming a wonderful improvement upon the rude simplicity of Bellenden. The worthy bishop informs us that he stops at the beginning of Queen Mary's reign, because the transactions subsequent to that period contain much that he does not think would reflect honour upon his country: there could be few whose words were more worth listening to respecting that important and greatly controverted part of our history.

The volume alluded to contains a portrait of Leslie, representing him as a grave and venerable man, with an aquiline nose, a small beard, and a very lofty and capacious forehead. As a specimen of the Scottish which a learned prelate would then write, and a queen peruse, we may quote the bishop's character of James V.:-

"Their was gryt dule and meane maid for him throw all the partis of his realme, because he was a nobill prince, and travaillet mekill all his dayis for manitening of his subjectis in peace, justice, and quietnes. He was a man of pearsonage and stature convenient, albeit nichtie and strong theirwith; of countenance amiable and lufely, specially in his communication; his eyes graye and scharp of sicht, that quhomsoever he did ones see and marke, he wald perfytly knawe in all tymes thairefter; of witt in all things quick and prompt, of a princely stomacke and heich courage in greit perillis, doubtfult affairis and materis of weichtie importance; he had in a maner a divine foresicht, for in sic thingis as he went about to doo, he did them advisedlye, and with grit deliberacion, to the intent that amangis all men his witt and prudence might be noted and regardit, and alsfarre excell and pas all uthers in estait and dignitie. Besides this, he was sober, moderate, honest, effaill, curteous; and so farr abhorrit pride and arrogance,

that he was ever sharpe and quick to thame quihlk were spotted or nottit with that crime. He was alsua a good and suir justiciar, be the quihlke one thing he allurit to him the hartis of all the people, because they lived quietlie and in rest, out of all oppressioun and molestacioun of the nobilitye and riche persones; and to this severte of his wes joint and annexit a certane merciful pitye, quihlk he did oftymes shaw to sic as had offendit taking rather composicions of money nor menis lyvis. . . . This gude and modest prince did not devoure and consume the riches of his country, for by his heich pollicye marvellouslie riched his realme and himselfe, both with gold and silver, all kinds of riche substance, quahairof he left greyt stoir and quantitie in all his palices at his departing. And so this king, living all his tyme in the favour of fortune, in heich honour, riches, and glorye, and for his nobill actis and prudent pollicyes, worthye to be registrat in the buike of fame, gaif up and randerit his spreit into the hands of Allmichty God, quhair I doubt not bot he hes suir fruition of the joye that is preparit for these as sell sitt on the richt hand of our Salveour."

LESLIE, SIR JOHN, professor of natural philosophy in the university of Edinburgh, and distinguished by his valuable writings and discoveries, was born at the kirk-town of Largo, in Fife, on the 16th of April, 1766. His father, Robert Leslie, by profession a joiner and cabinet-maker, and originally from the neighbourhood of St. Andrews, was a much respected and worthy man, and seems, in point of education and general attainments, to have been superior to the majority of persons in his station at that period. The mother of Sir John Leslie was Anne Carstairs, a native of Largo. When very young he was sent to a woman's school in the village, but remained only a short time there. Afterwards he was placed under a Mr. Thomson at Lundin Mill, with whom he learned to write; and lastly he went to Leven school and began to learn Latin; but being a weakly boy and unable to walk so far, he was obliged after about six weeks to give up attendance. As these were the only schools he attended before going to college, it is evident that his elementary acquirements must have been exceedingly imperfect. He received however, while at home, some lessons in mathematics from his elder brother Alexander, and soon began to show a surprising aptitude for that branch of science. His manners at this period of life were remarkably reserved and shy. He seemed bent on devoting himself entirely to study, and read with peculiar avidity all the books that came within his reach on mathematics and natural philosophy. To Latin he took a strong dislike, and could not be induced to resume the study of it till after his first year at college.

His extraordinary proficiency in geometrical exercises, joined to a consideration of the unfavourable circumstances under which he had acquired it, brought him at an early period under the notice of Professors Robison and Stewart, of the university of Edinburgh, who were much impressed by the extraordinary powers which he displayed. It was at length resolved by his parents that he should be sent to the university of St. Andrews, in order to fit himself for a learned profession, and he was accordingly entered there as a student of mathematics in 1779. At the first distribution of prizes he attracted some attention by his proficiency, which was the means of introducing him to the patronage of the Earl of Kinnoul, then chancellor of the university. Being now destined for the church, he went through the regular routine of instructions for that purpose. After at-

tending for six sessions at St. Andrews, he removed to Edinburgh, in company with another youth—destined like himself to obtain a high niche in the temple of fame, and to be honoured, at the same moment with himself, more than forty years after, with a royal favour expressive of his equal merit—James (afterwards Sir James) Ivory. At St. Andrews he had also formed an acquaintance with Dr. William Thomson, the continuator of Watson's *Life of Philip II.*, and latterly a professed author of no small note in London. At the university of Edinburgh Mr. Leslie studied three years, during which time he was introduced to Dr. Adam Smith, and employed by that eminent man in assisting the studies of his nephew, afterwards Lord Reston. He now gave up his intention of adopting the clerical profession, which he found to be in a great measure incompatible with the strong bent which his mind had taken towards physical studies.

In 1788 he went to Virginia, as tutor to two young college friends, Messrs. Randolph; and after spending more than a year in America, returned to Edinburgh. In January, 1790, he proceeded to London, carrying with him some commendatory letters from Dr. Smith; he has been heard to mention, that one of the most pressing injunctions with which he was honoured by that illustrious philosopher, was to be sure, if the person to whom he was to present himself was an author, to read his book before approaching him, so as to be able to speak of it, if there should be a fit opportunity. His first intention was to deliver lectures on natural philosophy; but being disappointed in his views, he found it expedient to commence writing for periodical works, as the readiest means of obtaining subsistence. For obtaining employment of this kind he was mainly indebted to his friend Dr. William Thomson, who engaged him upon the notes of a new edition of the Bible, which he was then publishing in numbers. About three months after his arrival in London he made an agreement with Mr. Murray, the bookseller, to translate Buffon's *Natural History of Birds*, which was published in 1793, in nine octavo volumes. The sum he received for it laid the foundation of that pecuniary independence which, unlike many other men of genius, his prudent habits fortunately enabled him early to attain. The preface to this work, which was published anonymously, is characterized by all the peculiarities of his later style; but it also bespeaks a mind of great native vigour and lofty conceptions, strongly touched with admiration for the sublime and the grand in nature and science. During the progress of the translation he fulfilled an engagement with the Messrs. Wedgwood of Etruria in Staffordshire, to superintend their studies; he left them in 1792. In 1794 Mr. Leslie spent a short time in Holland; and, in 1796, he made the tour of Germany and Switzerland with Mr. Thomas Wedgwood, whose early death he ever lamented as a loss to science and his country. About this period he stood candidate for a chair at St. Andrews, and subsequently for that of natural philosophy in Glasgow, but without success. The fortunate candidate on the latter occasion was Dr. James Brown of St. Andrews, with whom Mr. Leslie to the end of his life maintained a constant intimacy. In 1799 he travelled through Norway and Sweden in company with Mr. Robert Gordon, whose friendship he had acquired at St. Andrews College.

At what period Mr. Leslie first struck into that brilliant field of inquiry where he became so conspicuous for his masterly experiments and striking discoveries regarding radiant heat, and the connection between light and heat, we are unable to say.

But his differential thermometer—one of the most beautiful and delicate instruments that inductive genius ever contrived as a help to experimental inquiry, and which rewarded its author by its happy ministry to the success of some of his finest experiments—must have been invented before the year 1800, as it was described in Nicholson's *Philosophical Journal* some time during that year. The results of those fine inquiries, in which he was so much aided by this exquisite instrument, were published to the world in 1804, in his celebrated *Essay on the Nature and Propagation of Heat*.¹ The experimental devices and remarkable discoveries which distinguish this publication far more than atone for its great defects of method, its very questionable theories, and its transgressions against that simplicity of style which its aspiring author rather spurned than was unable to exemplify; but which must be allowed to be a quality peculiarly indispensable to the communication of scientific knowledge. The work was honoured, in the following year, by the unanimous adjudication to its author, by the council of the Royal Society, of the Rumford medals, appropriated to reward discoveries in that province whose nature and limits he had so much illustrated and extended.

Mr. Leslie had thus distinguished himself by his acquirements, when, early in 1805, in consequence of the translation of Professor Playfair from the chair of mathematics to that of natural philosophy in the university of Edinburgh, the former became vacant, and the subject of this memoir appeared as a candidate for the situation. It might have been expected that, where the qualifications of the individual were so decidedly above all rivalry, there could have been no hesitation in his native country to confer upon him the honour which he sought. Such there might not have been, if what is called the moderate party in the Scottish church had not been inspired by a jealousy of his liberal principles in politics, accompanied by a desire of advancing one of their own number to oppose his election. The person brought forward as the rival candidate was Dr. Thomas Macknight, one of the ministers of the city, and son of the venerable commentator on the epistles—a gentleman highly qualified, no doubt, not only for this, but for almost any other chair in the university; but who, nevertheless, could not be matched against an individual so distinguished for the benefits he had conferred on science as Mr. Leslie; and who was moreover liable to the disqualifying consideration that he was already engaged in an office which, to be well done, requires the whole man, while Mr. Leslie stood in the light of a most useful member of society in a great measure unprovided for.

The electors in this case were the magistrates and town-council of Edinburgh, and to them Mr. Leslie was recommended not only by fame, but by the warmest testimonials from Sir Joseph Banks, Mr. Dempster of Dunnichen, Dr. Hutton of Woolwich, Baron Masseres, and Dr. Maskelyne. In the supposition that these electors were disposed to discharge their trust with fidelity, they could have no hesitation in preferring Mr. Leslie; and it is to be related to their credit, that they had no such hesitation. On learning the bent of their resolution, the ministers of Edinburgh held various private meetings, as if to indicate the more pointedly that they had a peculiar interest of their own in the matter; and it was resolved to oppose Mr. Leslie's election on the

grounds of what they deemed an infidel note in his *Essay on Heat*; employing for this purpose a clause in the fundamental charter of the college, directing the magistrates to take the advice of the Edinburgh clergy in the election of professors.

The note alluded to was one in reference to the unphilosophical theories which once attempted to explain the phenomena of gravitation by means of invisible ethers. Mr. Leslie, in treating this point, found it convenient to refer to Mr. Hume's theory of cause and effect, in which, as is well known, he makes use of certain generally received doctrines to invalidate the argument for the existence of the Deity. In making the reference it did not seem to Mr. Leslie to be necessary that he should condemn the ultimate use made of these doctrines by Mr. Hume, since he was only engaged in a physical examination. His note, therefore, stands as follows: "Mr. Hume is the first, so far as I know, who has treated of causation in a truly philosophic manner. His *Essay on Necessary Connection* seems a model of clear and accurate reasoning. But it was only wanted to dispel the cloud of mystery which had so long darkened that important subject. The unsophisticated sentiments of mankind are in perfect unison with the deductions of logic, and imply at bottom nothing more in the relation of cause and effect than a constant invariable sequence." From these words, however, it was evident, in the opinion of his clerical opponents, "that Mr. Leslie, having, with Mr. Hume, denied all such necessary connection between cause and effect as implies an operating principle in the cause, has of course laid a foundation for rejecting all argument that is derived from the works of God to prove either his being or attributes."

When Mr. Leslie was informed of the grounds on which the Edinburgh ministers rested their opposition, he addressed a letter to the Rev. Dr. Hunter, professor of divinity, and one of the few clergymen of the city who were not opposed to him, laying before him some explanations of the note, to which he begged him to call the attention of his brethren. These explanations were chiefly what are stated above, and are thus followed up: "I have the fullest conviction that my ideas on the question to which the note refers would appear to coincide, in every essential respect, with those of the most enlightened adversaries of Mr. Hume's philosophy. But, limited as I am to a few moments of time, I can only disavow (which I do with the greatest sincerity and solemnity) every inference which the ingenuity of my opponents may be pleased to draw from the partial view I have taken of the general doctrine, to the prejudice of those evidences on which the truths of religion are founded. If I live to publish another edition of my work, I pledge myself to show in an additional paragraph how grossly and injuriously I have been treated on this occasion. . . . It is painful to be called on, after the habits of intimacy in which I have lived with the most exemplary characters in both parts of the island, to repel a direct charge of atheism; but whatever may be the effect of such calumnies on the minds of strangers, it affords me much consolation to think that they will be heard with contempt and indignation by those who know the real state of my sentiments, and particularly by such as are acquainted with the strictness of those religious principles in which I had the happiness to be educated from my earliest years."

This letter was laid before the ministers at a meeting held by them on the 12th of March, 1805; but being, to use their own phrase, by no means satisfied with it, they appointed a committee, con-

¹ Previous to this period Mr. Leslie, when not otherwise or elsewhere engaged, used to live with his brothers at Largo; and there were the experiments for his *Essay on Heat* carried on, and the book written.

sisting of Dr. Grieve, Mr. David Black, Mr. David Dickson, and Dr. Inglis, to proceed to the town-council and protest against the election of Mr. Leslie. As the council was to be that day engaged in the election, the committee went accordingly to their chamber, and presented a protest which had been prepared, in which, besides stating the grand objection of the note and their inferences from it as to Mr. Leslie's religious principles, they stated that, "in the event of his being elected, notwithstanding this representation, they reserved to themselves full power of questioning the validity of such election, and of employing whatever means may to them be found competent for preventing Mr. Leslie's induction into the office of professor; with full power, in the event of his induction, to prosecute for his ejection from said office in any competent court, civil or ecclesiastical." Immediately after this paper was given in and its bearers had left the hall, the council elected Mr. Leslie.

At the meeting of the presbytery of Edinburgh on the 27th, the committee of the city clergy gave in a representation stating these transactions, along with a copy of their protest, and requested the reverend court to take such steps in the matter as they might judge proper. It was here determined by vote to carry the affair before the synod; a step formally necessary for bringing it under the decision of the highest national church-court, the General Assembly.

At the meeting of this court on the 22d of May, the case of Mr. Leslie came before it in the shape of a complaint by the Rev. Sir Henry Moncrieff and other members of the synod, against the reference of the case to the General Assembly. It was thus apparent that the leaders of the more zealously pious party of the church had taken the part of Mr. Leslie against their accustomed opponents. The interest which the public could not have failed to entertain respecting the question, even if confined to its native merits, was excited to an uncommon degree by this complication of the phenomenon. The case, nevertheless, furnished only an unusually striking example of what must always be the result of a party system in any deliberative body. It happened to be convenient for the "moderate" party on this particular occasion, to show an anxious desire for the purity of faith and doctrine; and for this purpose they raked up a negative title in the Edinburgh clergy to be consulted in the exercise of the town-council patronage, which had not been acted upon for twenty-six years, during which time several of the very men now prosecuting had been elected to chairs in the university without regard to it. It was equally convenient for the evangelical party, though adverse to all their usual principles, to regard the suspected infidelity of Mr. Leslie with a lenient and apologetic spirit, in order that they might be in their usual position regarding their opponents, and because they hoped to gain a triumph for themselves in the non-success of a prosecution which they could easily see rested upon no valid grounds, and could hardly, in the face of public opinion, be carried to its utmost extent, even though a majority of servile votes could have been obtained for the purpose.

In the course of the long debate which followed the introduction of the case, some very strong testimonies were brought forward in favour of Mr. Leslie's moral and religious character; and the speeches on either side, which occupied two days, were characterized by a metaphysical depth and an amount of scientific knowledge which perhaps no other church-court in Europe could have equalled. Near midnight on the second day of the debate, it was determined by 96 against 84 to dismiss this vexatious case with-

out further notice. On the vote being announced, a shout of applause—an unwonted sound in the General Assembly—burst from the crowd assembled in the galleries.

Mr. Leslie entered without further opposition upon the duties of his chair, and upon a course of experimental discovery by which he was to confer lustre upon the university. Through the assistance of one of his ingenious contrivances—his hygrometer—he arrived in 1810 at the discovery of that singularly beautiful process of artificial congelation, which enabled him to convert water and mercury into ice. "We happened," says a brother professor, "to witness the consummation of the discovery—at least, of the performance of one of the first successful repetitions of the process by which it was effected; and we shall never forget the joy and elation which beamed on the face of the discoverer, as, with his characteristic good nature, he patiently explained the steps by which he had been led to it."

In 1809 Mr. Leslie published his *Elements of Geometry*, which immediately became a class-book, and has since gone through four editions. He also published, in 1813, an *Account of Experiments and Instruments depending on the relation of Air to Heat and Moisture*. In 1817 he produced his "*Philosophy of Arithmetic*, exhibiting a Progressive View of the Theory and Progress of Calculation," a small octavo; and, in 1821, his "*Geometrical Analysis and Geometry of Curve Lines*, being volume second of a Course of Mathematics, and designed as an Introduction to the Study of Natural Philosophy."¹ In 1822 he published *Elements of Natural Philosophy* for the use of his class—reprinted in 1829—and of which only one volume appeared. *Rudiments of Geometry*, a small octavo, published 1828, and designed for popular use, was his last separate work. Besides these separate works he wrote many admirable articles in the *Edinburgh Review*, three profound treatises in *Nicholson's Philosophical Journal*, a few in the *Transactions of the Royal Society of Edinburgh*, and several very valuable articles on different branches of physics in the Supplement to the *Encyclopædia Britannica*. In 1819, on the death of Professor Playfair, whose promotion had formerly made room for him in the chair of mathematics, he was elevated to the professorship of natural philosophy, by which his powers were of course brought into a far wider field of display and of usefulness than they had been for the preceding fourteen years. Among the preliminary treatises of the seventh edition of the *Encyclopædia Britannica*, which began to be published in 1830, he wrote a "Discourse on the History of Mathematical and Physical Science during the Eighteenth Century," which may be described as one of the most agreeable and masterly of all his compositions.

The income enjoyed by Mr. Leslie was for many years so much above his necessities, that he was able, by careful management, to realize a fortune not far short of ten thousand pounds. Part of this he expended, in his latter years, upon the purchase and decoration of a mansion called Coates, near his native village, where he spent all the intervals allowed by his college duties. Early in the year 1832, at the recommendation of the lord-chancellor (Brougham), he was invested with a knighthood of the Guelphic

¹ The *Elements of Geometry* included trigonometry and geometrical analysis in one volume, for the three first editions; and the curve lines of the second order was a small separate work. In the fourth edition of the *Geometry*, 1820, one volume included geometry and trigonometry, and the second, published some time after, consisted of geometrical analysis, including the curves of the second order formerly published, with the addition of the higher curves.

order, at the same time that Messrs. Herschel, C. Bell, Ivory, Brewster, South, and Harris Nicolas, received a similar honour. Sir John Leslie was not destined long to enjoy the well-merited distinction. In the end of October, while superintending some of the improvements about his much-loved place, he incautiously exposed himself to wet, the consequence of which was a severe cold. Among the various foibles which protruded themselves through the better powers and habitudes of his mind, was a contempt for medicine, and an unwillingness to think that he could be seriously ill. He accordingly neglected his ailment, and was speedily seized with erysipelas in one of his legs; a disorder at that time raging in Scotland with all the symptoms and effects of a malignant epidemic. On Wednesday, October 31st, he again exposed himself in his grounds, and from that day the malady advanced very rapidly. On the evening of Saturday, November 3d, he breathed his last.

The scientific and personal character of Sir John Leslie has been sketched with so bold and free a pencil by Mr. Macvey Napier, his brother in both academic and literary labours, that we make no apology for presenting it to the reader, in lieu of anything of our own:—

“It would be impossible, we think, for any intelligent and well-constituted mind to review the labours of this distinguished man, without a strong feeling of admiration for his inventive genius and vigorous powers, and of respect for that extensive knowledge which his active curiosity, his various reading, and his happy memory had enabled him to attain. Some few of his contemporaries in the same walks of science may have excelled him in profundity of understanding, in philosophical caution, and in logical accuracy; but we doubt if any surpassed him, whilst he must be allowed to have surpassed many, in that creative faculty—one of the highest and rarest of nature’s gifts—which leads and is necessary to discovery, though not all-sufficient of itself for the formation of safe conclusions; or in that subtlety and reach of discernment which seizes the finest and least obvious relations among the objects of science—which elicits the hidden secrets of nature, and ministers to new combinations of her powers. There were some flaws, it must be allowed, in the mind of this memorable person. He strangely undervalued some branches of philosophical inquiry of high importance in the circle of human knowledge. His credulity in matters of ordinary life was, to say the least of it, as conspicuous as his tendency to scepticism in science. It has been profoundly remarked by Mr. Dugald Stewart, that ‘though the mathematician may be prevented, in his own pursuits, from going far astray, by the absurdities to which his errors lead him, he is seldom apt to be revolted by absurd conclusions in other matters. Thus, even in physics,’ he adds, ‘mathematicians have been led to acquiesce in conclusions which appear ludicrous to men of different habits.’ Something of the same kind was observable in the mind of this distinguished mathematician, for such also he was. He was apt, too, to run into some startling hypothesis, from an unwarrantable application of mathematical principles to subjects altogether foreign to them; as when he finds an analogy between circulating decimals and the lengthened cycles of the seasons. In all his writings, with the exception perhaps of his last considerable performance, the discourse prefixed to the seventh edition of the *Encyclopædia Britannica*, even in the sober field of pure mathematics, there is a constant straining after ‘thoughts that breathe and words that burn,’ and a love of abstract, and figurative, and novel modes of

expression, which has exposed them to just criticism by impartial judges, and to some puny fault-finding by others, more willing to carp at defects than to point out the merits which redeem them. But when even severe criticism has said its worst, it must be allowed that genius has struck its captivating impress deep and wide over all his works. His more airy speculations may be thrown aside or condemned; but his exquisite instruments, and his original and beautiful experimental combinations, will ever attest the fruitfulness of his mind, and continue to act as helps to farther discovery. We have already alluded to the extent and excursiveness of his reading. It is rare, indeed, to find a man of so much invention, and who himself valued the inventive above all the other powers, possessing so vast a store of learned and curious information. His reading extended to every nook and corner, however obscure, that books have touched upon. He was a lover, too, and that in no ordinary degree, of what is commonly called anecdote. Though he did not shine in mixed society, and was latterly unfitted by a considerable degree of deafness for enjoying it, his conversation, when seated with one or two, was highly entertaining. It had no wit, little repartee, and no fine turns of any kind, but it had a strongly-original and racy cast, and was replete with striking remarks and curious information.

“He had faults, no doubt, as all ‘of woman born’ have: he had prejudices, of which it would have been better to be rid; he was not over charitable in his views of human virtue; and he was not quite so ready, on all occasions, to do that justice to kindred merit as was to be expected in so ardent a worshipper of genius. But his faults were far more than compensated by his many good qualities—by his constant equanimity, his cheerfulness, his simplicity of character almost infantine, his straightforwardness, his perfect freedom from affectation, and, above all, his unconquerable good nature.¹ He was, indeed, one of the most placable of human beings; and if, as has been thought, he generally had a steady eye, in his worldly course, to his own interest, it cannot be denied that he was, notwithstanding, a warm and good friend, and a relation on whose affectionate assistance a firm reliance could ever be placed.

“There is one other matter which, in justice to the illustrious dead, we cannot pass over in silence; we mean the permanent service rendered to the class of natural philosophy by the late Sir John Leslie in the collection of by far the finest and most complete set of apparatus in the kingdom. Augustus boasted that he found Rome built of brick, and left it a city of palaces and temples constructed of marble. Without any exaggeration, something analogous may be predicated of Sir John Leslie in regard to the apparatus of this class. He found it a collection of antiquated and obsolete rubbish; he left it the most complete and perfect of its kind in this kingdom; and if it had pleased God to spare him a few years longer, it would, beyond all doubt, have been rendered the

¹ The person of Sir John Leslie was, in later life, far from gainly. He was short and corpulent, with a florid face and somewhat unsightly projection of the front teeth, and tottered considerably in walking. He was, moreover, very slovenly in his mode of dressing—a peculiarity the more curious, as it was accompanied by no inconsiderable share of *self-respect*, and an anxiety to be thought young and engaging. The mixture of great intellectual powers with the humbler weaknesses of human nature can seldom have been more strikingly exemplified than in his case; though it is evident that, as his weaknesses were very much those to which unmarried men in advanced life are supposed to be most peculiarly liable, they might have probably been obviated in a great measure if he had happened to spend his life in the more fortunate condition of matrimony.

first in Europe or the world. The renovation which he effected was, indeed, most radically complete. The whole of the old trash was thrown aside, and its place supplied by new instruments, constructed on the most improved principles by the most celebrated artists both in this country and on the Continent; while its absolute amount was increased tenfold, and adapted in the happiest manner to the present advanced state of science. His perseverance and enthusiasm in this respect were indeed boundless; and as his predecessors were not experimentalists, in the same sense in which he was, and had made little or no effort to accommodate the apparatus to the progress of science, or even to repair the wear and tear of time, he had the whole to create, in the same way as if the class had only been founded when he was first promoted to the chair. By his own continued and admirably-directed efforts, aided by the liberality of the patrons, who generously made him several grants in furtherance of the object which he had so much at heart—and also by very considerable pecuniary sacrifices upon his own part, for which he has never as yet got the credit that is so justly due to him—he at length succeeded in furnishing the apparatus-room in the manner in which it may now be seen by any one who chooses to visit it, and thus conferred upon the university a benefit for which it ought to be for ever grateful to his memory. This may sound strange in the ears of those who have been accustomed to hear it said, as it has often been, most falsely, that Sir John Leslie was a bad experimenter. The truth is, that of all his great and varied gifts, none was more remarkable than the delicacy and success with which he performed the most difficult experiments, excepting perhaps his intuitive sagacity in instantly detecting the cause of an accidental failure; and it is a known fact, that, after he had discovered and communicated to the world his celebrated process of artificial congelation, particularly as applied to the freezing of mercury, some of the first men of science in London failed of performing it, till the discoverer himself, happening to be on the spot personally, showed them wherein consisted the fault of their manipulation, and at once performed the experiment which had previously baffled all their efforts. It is equally well known to those who were acquainted with him, that the most elegant in form as well as the most delicate in operation of the beautiful instruments invented by himself were constructed by his own hand, and that this, to him most agreeable employment, constituted the recreation of his leisure hours. The apparatus-room, indeed, contains many specimens of his workmanship in this line, and they are of such a description as would not do any discredit to the most practised and skilful artist. To his immediate successor his acquisitions and his labours will therefore be of incalculable importance; but the merit which really belongs to him can only be duly estimated by those who know what he found when he became professor of natural philosophy, and can compare it with the treasures which he has left behind him."¹

¹ Some further particulars respecting his various talents and acquisitions may be gathered from the following notice which appeared in the *Edinburgh Courant*, and seems to be the production of one qualified in more ways than one to speak upon the subject.—“Sir John Leslie has been for many years known in this country, and over all Europe, as one of the most eminent characters of the age. As a mathematician and philosopher—a profound and accomplished scholar—as a proficient in general literature, and in history and many other branches of knowledge—he had few rivals. But it was for mathematical science and its kindred studies that he discovered, at a very early period, a decided predilection; and it is in the successful illustration of scientific truth and of all the complicated phenomena of physics that his great reputation has been acquired. In

LEVEN, EARL OF. See LESLIE (ALEXANDER).

LEYDEN, JOHN, a man of singularly varied genius and accomplishment, was born on the 8th of September, 1775, at Denholm, a village on the banks of the Teviot, in the parish of Cavers and county of Roxburgh. His parents were John Leyden and Isabella Scott, who had three sons and two daughters younger than himself. His ancestors in both lines had been farmers on the estate of Cavers for several generations; but his father, though skilful in rural affairs, declined to engage on his own account in the same occupation, thinking even the fortunate pursuit of gain a poor compensation for the anxiety that attends it. About a year after the birth of their first child, he removed to Henlawshiel on the farm of Nether Tofts, which was then occupied by Andrew Blythe, his wife's uncle, whom he first served as shepherd, and subsequently as overseer, his master having had the misfortune to lose his sight. The

these pursuits he was eminently qualified to excel by the great original powers of his mind, which were further stimulated by an ardent enthusiasm, and an early desire of distinction among the illustrious names of his day. Along with a profound knowledge of his subject, he possessed great inventive powers, which not only enabled him to sound the depths of science, but to expound its important problems with a simplicity and elegance rarely equalled. In making his way through the intricacies of physical research, his severe judgment guided him in the right path; and hence his demonstrations always afford a striking and beautiful display of pure reason, without any tendency to that spirit of metaphysical subtlety which occasionally perplexes the speculations of Laplace, Legendre, with others of the continental philosophers; and it is worthy of remark that, along with the penetrating force of his judgment, he carried into those studies that taste and fancy—that predilection for the beautiful—which may be recognized in all his speculations, whether in literature or in science. His taste in geometry was founded on the purest models of Grecian philosophy; he delighted to expound to his pupils the simplicity and elegance of the demonstrations by the great masters of antiquity; he commended them to their imitation, and expatiated on the subject in a manner well fitted to inspire a kindred enthusiasm; so that we might have fancied that he was dilating, not on the merits of a mathematical problem, but on some of those beautiful forms and classic models of ancient art which have been the wonder of all succeeding times. Nor was this admiration of ancient geometry a mere pedantic or barren speculation. The great philosopher of whom we are speaking carried his principles into practice, and applied the abstract properties of figures with the happiest success to experimental philosophy; many branches of which he greatly extended by his discoveries; and in all of them he developed the most original views, which may yet be traced to important results. The range of his studies was amazingly extensive; and he had accumulated vast stores of knowledge, especially on scientific subjects. He was deeply versed in the history of science, which he had traced from its earliest dawnings in the times of Greece and Rome, through all the subsequent vicissitudes which it experienced during the dark ages of barbarism, till it was revived by the Arabians in the East, and was afterwards improved and perfected by the more brilliant discoveries of modern times. We speak literally when we say, that we doubt if there is a single publication relating to this subject, either in the ancient or the modern languages, which he had not diligently perused; and his knowledge, minute and accurate on every point, and, once acquired, never forgotten, overflowed in his conversation and in his writings. The date of any great discovery was familiar to him; he could give anecdotes or biographical sketches of all the great promoters of science in every age; and the prodigality of his information was not more surprising than the ease with which he preserved its disposition and arrangement, under certain great leading principles, which were the landmarks of his mind, by which the store of facts which he had been treasuring up for years was reduced into order, and each distributed into its proper place in the great system of which it formed a part. For the truth of this remark we may refer to his ‘History of the Barometer’ in the *Edinburgh Review*, and to his papers on meteorology and other subjects in the *Encyclopædia Britannica*, to his continuation of Playfair’s *Introductory Discourses* prefixed to that work, as well as to many of his other productions, which display the great extent of his researches. On other subjects also, not connected with his peculiar studies, his information was minute and extensive. He was deeply read in Scottish history and antiquities; and on all modern questions of politics or political economy he had his own original ideas, which he was always ready to express and expound in a fair and temperate strain.”

cottage in which the family resided was of a humble construction; its internal accommodations were equally simple; but it was situated at the foot of the majestic hill of Rubislaw, and there, among the "dun heathy slopes and valleys green," did Leyden imbibe that enthusiasm and manliness of character which afterwards displayed themselves so strongly in his domestic affections, in his love of country, and in his unwearied pursuit of knowledge.

With the inmates of his father's house dwelt intelligence, cheerful content, and piety; and in this scene of the domestic virtues Leyden was taught to read by his grandmother, under whom he soon acquired a familiar acquaintance with the events recorded in the sacred volume, the historical passages in the Old Testament having first attracted his attention. His taste for reading, once kindled, spread like the *moorburn* on his native heaths, first over the books in his father's possession, and then to the shelves of the neighbours. Some popular works on Scottish history supplied the inspiring recital of the deeds of Wallace and Bruce, which, beyond their immediate benefit, have continued as examples through succeeding ages to cherish sentiments of independence in every generous bosom. Among the other productions with which he was greatly delighted, have been enumerated the poems of Sir David Lindsay, *Paradise Lost*, Chapman's translation of *Homer*, and the *Arabian Nights Entertainments*. An odd volume of the last-named work he obtained, when he was about eleven years old, by a resolute perseverance of solicitation quite commensurate with the ardour of his subsequent literary career. He had received from a companion some account of its contents, and been told that the treasure belonged to a blacksmith's apprentice who resided at some miles' distance from his father's house. The very next morning Leyden waded through the snow in the hope of being allowed to peruse a part of the volume in the owner's presence—for he had no title to expect a loan of it in any other way; and that he might have leisure to do so, he set out betimes. On reaching the smithy, learning that the lad had gone from home to do some work, he proceeded to the place, and, having preferred his request, met with a refusal. But he was not to be so dismissed; and continuing beside the lad the whole day, he either succeeded in gaining his good graces, or prevailed by the mere force of pertinacity, so that he got the book as a present, and returned home by sunset, "exhausted by hunger and fatigue," says Sir Walter Scott, "but in triumphant possession of a treasure for which he would have subjected himself to yet greater privations."

At nine years of age Leyden had been sent to the parish school of Kirktown, where, to writing and arithmetic, he added a little knowledge of Latin grammar. He continued here three years, with the interval of two very long vacations, in consequence of the death of one teacher and the removal of another. At these times he assumed the plaid, and looked after his father's flock when his assistance was needed. His parents now clearly perceived that the bent of their son's mind was for learning, and he was accordingly placed under the charge of Mr. Duncan, a Cameronian minister at Denholm, who instructed a few pupils,—he could not usually draw together more than five or six—in Greek and Latin. "Of the eagerness of his desire for knowledge," says the Rev. James Morton, "it may not be improper to relate an anecdote which took place at this time: Denholm being about three miles from his residence, which was rather too long a walk, his father was going to buy him an ass to convey him to and from

school. Leyden, however, was unwilling, from the common prejudice against this animal, to encounter the ridicule of his school-fellows by appearing so ignobly mounted, and would at first have declined the offered accommodation. But no sooner was he informed that the owner of the ass happened to have in his possession a large book in *some* learned language, which he offered to give into the bargain, than his reluctance entirely vanished, and he never rested until he had obtained this literary treasure, which was found to be the *Calepini Dictionarium Octolingue*."

After he had enjoyed the advantage of Mr. Duncan's instructions for two years, it was judged that he was qualified for college; and in November, 1790, his father accompanied him half-way to Edinburgh, with a horse which they rode alternately; he performed the rest of the journey on foot. His views being directed to the church, he began the usual course of study by attending the Greek and Latin classes; in the preparations for which he was assiduous, allotting a stated portion of time daily to the tasks of each professor, and employing the remaining hours in desultory reading, from which, having the command of the college library, he was not deterred, like some young men, by any difficulty of determining which books it would be most proper and advantageous for him to read first. His public appearances threatened at the outset to draw down upon him some degree of ridicule; but Professor Dalzell used to describe, with some humour, the astonishment and amusement excited in his class when John Leyden first stood up to recite his Greek exercise. The rustic yet undaunted manner, the humble dress, the high harsh tone of his voice, joined to the broad provincial accent of Teviotdale, decomposed on this first occasion the gravity of the professor, and totally routed that of the students. But it was soon perceived that these uncouth attributes were joined to qualities which commanded respect and admiration. The rapid progress of the young rustic attracted the approbation and countenance of the professor, who was ever prompt to distinguish and encourage merit; and to those among the students who did not admit literary proficiency as a shelter for the ridicule due since the days of Juvenal to the scholar's worn coat and unfashionable demeanour, Leyden was in no respect averse from showing strong reasons adapted to their comprehension, and affecting their personal safety, for keeping their mirth within decent bounds.¹

The Greek language was long his favourite study, and, considering his opportunities, he became much more intimately acquainted with its best authors than is usual in Scotland, even among those who make some pretensions to literature. The Latin he understood thoroughly; and it is perhaps the best proof of his classical attainments, that at a later period, to use his own expression, "he passed muster pretty well when introduced to Dr. Parr."

Leyden was now at the fountain-head of knowledge, and availed himself of former privations by quaffing it in large draughts. He not only attended all the lectures usually connected with the study of theology, but several others, particularly some of the medical classes—a circumstance which afterwards proved important to his outset in life, although at the time it could only be ascribed to his restless and impatient pursuit after science of every description.

¹ The ensuing part of the present article is borrowed, with very slight alterations, from a memoir of Dr. Leyden in the *Edinburgh Annual Register* for 1811—evidently, from its "careless inimitable graces," the composition of Sir Walter Scott.

Admission to these lectures was easy from the liberality of the professors, who throw their classes gratuitously open to young men educated for the church, a privilege of which Leyden availed himself to the utmost extent. There were indeed few branches of study in which he did not make some progress. Besides the learned languages, he acquired French, Spanish, Italian, and German, was familiar with the ancient Icelandic, and studied Hebrew, Arabic, and Persian.

But though he soon became particularly distinguished by his talents as a linguist, few departments of science altogether escaped his notice. He investigated moral philosophy with the ardour common to all youths of talent who studied ethics under the auspices of Professor Dugald Stewart, with whose personal notice he was honoured. He became a respectable mathematician, and was at least superficially acquainted with natural philosophy, natural history, chemistry, botany, and mineralogy. These various sciences he acquired in different degrees, and at different times, during his residence at college. They were the fruit of no very regular plan of study: whatever subject interested his mind at the time attracted his principal attention till time and industry had overcome the difficulties which it presented, and was then exchanged for another pursuit. It seemed frequently to be Leyden's object to learn just so much of a particular science as should enable him to resume it at any future period; and to those who objected to the miscellaneous, or occasionally the superficial, nature of his studies, he used to answer with his favourite interjection, "Dash it, man, never mind: if you have the scaffolding ready, you can run up the masonry when you please." But this mode of study, however successful with John Leyden, cannot be safely recommended to a student of less retentive memory and robust application. With him, however, at least while he remained in Britain, it seemed a matter of little consequence for what length of time he resigned any particular branch of study; for when either some motive or mere caprice induced him to resume it, he could with little difficulty reunite all the broken associations, and begin where he left off months or years before, without having lost an inch of ground during the interval.

The vacations which our student spent at home were employed in arranging, methodizing, and enlarging the information which he had acquired during his winter's attendance at college. His father's cottage affording him little opportunity for quiet and seclusion, he was obliged to look out for accommodations abroad, and some of his places of retreat were sufficiently extraordinary. In a wild recess, in the den or glen which gives name to the village of Denholm, he contrived a sort of furnace for the purpose of such chemical experiments as it was adequate to performing. But his chief place of retirement was the small parish church, a gloomy and ancient building, generally believed in the neighbourhood to be haunted. To this chosen place of study, usually locked during week-days, Leyden made entrance by means of a window, read there for many hours in the day, and deposited his books and specimens in a retired pew. It was a well-chosen spot of seclusion, for the kirk (excepting during divine service) is rather a place of terror to the Scottish rustic, and that of Cavers was rendered more so by many a tale of ghosts and witchcraft, of which it was the supposed scene; and to which Leyden, partly to indulge his humour, and partly to secure his retirement, contrived to make some modern additions. The nature of his abstruse studies, some specimens of natural history, as toads and adders, left exposed

in their spirit-vials, and one or two practical jests played off upon the more curious of the peasantry, rendered his gloomy haunt not only venerated by the wise, but feared by the simple, of the parish, who began to account this abstracted student, like the gifted person described by Wordsworth, as possessing—

"—— Waking empire wide as dreams,
An ample sovereignty of eye and ear;
Rich are his walks with supernatural cheer;
The region of his inner spirit teems
With vital sounds, and monitory gleams
Of high astonishment and pleasing fear."

This was a distinction which, as we have already hinted, he was indeed not unwilling to affect, and to which, so far as the visions existing in the high fancy of the poet can supply those ascribed to the actual ghost-seer, he had indeed no slight pretensions.

Books as well as retirement were necessary to the progress of Leyden's studies, and not always attainable. But his research collected from every quarter such as were accessible by loan, and he subjected himself to the utmost privations to purchase those that were not otherwise to be procured. The reputation also of his prosperous career of learning obtained him occasional access to the library of Mr. Douglas of Cavers—an excellent old collection, in which he met for the first time many of those works of the middle ages which he studied with so much research and success. A *Froissart* in particular, translated by Lord Berners, captivated his attention with all those tales "to savage virtue dear," which coincided with his taste for chivalry, and with the models on which it had been formed; and tales of the Black Prince, of the valiant Chandos, and of Geoffrey Tête-Noir, now rivalled the legends of Johnnie Armstrong, Walter the Devil, and the Black Douglas.

In the country Leyden's society was naturally considerably restricted, but while at college it began to extend itself among such of his fellow-students as were distinguished for proficiency in learning. Among these we may number the celebrated author of the *Pleasures of Hope*; the Rev. Alexander Murray united with Leyden in the kindred pursuit of oriental learning, and whose lamp, like that of his friend, was extinguished at the moment when it was placed in the most conspicuous elevation; William Erskine, author of a poetical epistle from St. Kilda, with whom Leyden renewed his friendship in India; the ingenious Dr. Thomas Brown, distinguished for his early proficiency in the science of moral philosophy, of which he was afterwards professor in the Edinburgh college; the Rev. Robert Lundie, minister of Kelso; and several other young men of talent, who at that time pursued their studies in the university of Edinburgh.

In the year 1796 the recommendation of Professor Dalzell procured Leyden the situation of private tutor to the sons of Mr. Campbell of Fairfield, a situation which he retained for two or three years. During the winter of 1798 he attended the two young gentlemen to their studies at the college of St. Andrews. Here he had the advantage of the acquaintance of Professor Hunter, an admirable classical scholar, and to whose kind instructions he professed much obligation. The secluded situation also of St. Andrews, the monastic life of the students, the fragments of antiquity with which that once metropolitan town is surrounded, and the libraries of its colleges, gave him additional opportunity and impulse to pursue his favourite plans of study.

About the time he resided at St. Andrews, the renown of Mungo Park, and Leyden's enthusiastic

attachment to all researches connected with oriental learning, turned his thoughts towards the history of Africa, in which he found much to enchant an imagination which loved to dwell upon the grand, the marvellous, the romantic, and even the horrible, and which was rather fired than appalled by the picture of personal danger and severe privation. Africa indeed had peculiar charms for Leyden. He delighted to read of hosts whose arrows intercepted the sunbeams; of kings and soldiers who judged of the numberless number of their soldiers by marching them over the trunk of a cedar, and only deemed their strength sufficient to take the field when such myriads had passed as to reduce the solid timber to impalpable dust: the royal halls also of Dahomey, built of skulls and cross-bones, and moistened with the daily blood of new victims of tyranny;—all, in short, that presented strange, wild, and romantic views of human nature, and which furnished new and unheard-of facts in the history of man, had great fascination for his ardent imagination. And about this time he used to come into company quite full of these extraordinary stories, garnished faithfully with the unpronounceable names of the despots and tribes of Africa, which any one at a distance would have taken for the exorcism of a conjuror. The fruit of his researches he gave to the public in a small volume, entitled *A Historical and Philosophical Sketch of the Discoveries and Settlements of the Europeans in Northern and Western Africa at the Close of the Eighteenth Century*, crown 8vo, 1799. It is written on the plan of Raynal's celebrated work, and as it contains a clear and lively abridgment of the information afforded by travellers whose works are of rare occurrence, it was favourably received by the public.

On Leyden's return to Edinburgh from St. Andrews, he resided with his pupils in the family of Mr. Campbell, where he was treated with that respect and kindness which every careful father will pay to him whose lessons he expects his children to receive with attention and advantage. His hours, excepting those of tuition, were at his own uncontrolled disposal, and such of his friends as chose to visit him at Mr. Campbell's were sure of an hospitable reception. This class began now to extend itself among persons of an older standing than his contemporaries, and embraced several who had been placed by fortune, or had risen by exertions, to that fixed station in society to which his college intimates were as yet only looking forwards. His acquaintance with Mr. Richard Heber was the chief means of connecting him with several families of the former description, and it originated in the following circumstances.

John Leyden's feelings were naturally poetical, and he was early led to express them in the language of poetry. Before he visited St. Andrews, and while residing there, he had composed both fragments and complete pieces of poetry in almost every style and stanza which our language affords, from an unfinished tragedy on the fate of the Darien settlement, to songs, ballads, and comic tales. Many of these essays afterwards found their way to the press through the medium of the *Edinburgh Magazine*, at that time under the management or the patronage of Dr. Robert Anderson, editor of the *British Poets*, with whom Leyden was on terms of intimacy. In this periodical miscellany appeared from time to time poetical translations from the Greek Anthology, from the Norse, from the Hebrew, from the Arabic, from the Syriac, from the Persian, and so forth, with many original pieces, indicating more genius than taste, and an extent of learning of most unusual dimensions. These were subscribed J. L. About

this time also Mr. Archibald Constable was opening business, chiefly as a retailer of curious and ancient books, a department in which he possessed extensive knowledge; Mr. Richard Heber, the extent of whose invaluable library is generally known, was, in the winter of 1799–1800, residing in Edinburgh, and a frequenter of course of Mr. Constable's shop. In these researches he formed an acquaintance with Leyden, who examined as an amateur the shelves which Mr. Heber ransacked as a purchaser, and the latter discovered with pleasure the unknown author of the poems which have been already alluded to. The acquaintance soon ripened into friendship, and was cemented by mutual advantage. Mr. Heber had found an associate as ardent as himself in the pursuit of classical knowledge, and who would willingly sit up night after night to collate editions, and to note various readings; and Leyden, besides the advantage and instruction which he derived from Mr. Heber's society, enjoyed that of being introduced, by his powerful recommendation, to the literary gentlemen of Edinburgh, with whom he lived in intimacy. Among these may be reckoned the late Lord Woodhouselee, Mr. Henry Mackenzie, the distinguished author of the *Man of Feeling*, and the Rev. Mr. Sidney Smith, then residing in Edinburgh, from all of whom Leyden received flattering attention, and many important testimonies of the interest which they took in his success. By the same introduction he became intimate in the family of Mr. Walter Scott, where a congenial taste for ballad, romance, and border antiquities, as well as a sincere admiration of Leyden's high talents, extensive knowledge, and excellent heart, secured him a welcome reception. And by degrees his society extended itself still more widely, and comprehended almost every one who was distinguished for taste or talents in Edinburgh.

The manners of Leyden when he first entered into company were very peculiar; nor indeed were they at any time much modified during his continuing in Europe; and here perhaps, as properly as elsewhere, we may endeavour to give some idea of his personal appearance and habits in society. In his complexion the clear red upon the cheek indicated a hectic propensity, but with his brown hair, lively dark eyes, and well-proportioned features, gave an acute and interesting turn of expression to his whole countenance. He was of middle stature, of a frame rather thin than strong, but muscular and active, and well fitted for all those athletic exertions in which he delighted to be accounted a master. For he was no less anxious to be esteemed a man eminent for learning and literary talent, than to be held a fearless player at single-stick, a formidable boxer, and a distinguished adept at leaping, running, walking, climbing, and all exercises which depend on animal spirits and muscular exertion. Feats of this nature he used to detail with such liveliness as sometimes led his audience to charge him with exaggeration; but, unlike the athletic traveller in Æsop's apologue, he was always ready to attempt the repetition of his great leap at Rhodes, were it at the peril of breaking his neck on the spot. And certainly in many cases his spirit and energy carried him through enterprises which his friends considered as most rashly undertaken. An instance occurred on board of ship in India, where two gentlemen, by way of *quizzing* Leyden's pretensions to agility, offered him a bet of twenty gold mohrs that he could not go aloft. Our bard instantly betook himself to the shrouds, and, at all the risk incident to a landsman who first attempts such an ascent, successfully scaled the main-top. There it was intended to subject him to an unusual practical

sea-joke, by *seizing him up*, i.e. tying him, till he should redeem himself by paying a fine. But the spirit of Leyden dictated desperate resistance, and finding he was likely to be overpowered, he flung himself from the top, and seizing a rope, precipitated himself on deck by letting it slide rapidly through his grasp. In this operation he lost the skin of both hands, but of course won his wager. But when he observed his friends look grave at the expensive turn which their jest had taken, he tore and flung into the sea the order for the money which they had given him, and contented himself with the triumph which his spirit and agility had gained. And this little anecdote may illustrate his character in more respects than one.

In society John Leyden's first appearance had something that revolted the fastidious and alarmed the delicate. He was a bold and uncompromising disputant, and neither subdued his tone, nor mollified the form of his argument, out of deference to the rank, age, or even sex of those with whom he was maintaining it. His voice, which was naturally loud and harsh, was on such occasions exaggerated into what he himself used to call his *saw-tones*, which were not very pleasant to the ear of strangers. His manner was animated, his movements abrupt, and the gestures with which he enforced his arguments rather forcible than elegant; so that altogether his first appearance was somewhat appalling to persons of low animal spirits or shy and reserved habits, as well as to all who expected much reverence in society on account of the adventitious circumstances of rank or station. Besides, his spirits were generally at top-flood, and entirely occupied with what had last arrested his attention, and thus his own feats, or his own studies, were his topic more frequently than is consistent with the order of good society, in which every person has a right to expect his share of conversation. He was indeed too much bent on attaining personal distinction in society to choose nicely the mode of acquiring it. For example, in the course of a large evening party, crowded with fashionable people, to many of whom Leyden was an absolute stranger, silence being imposed for the purpose of a song, one of his friends, with great astonishment and some horror, heard Leyden, who could not sing a note, scream forth a verse or two of some border ditty, with all the dissonance of an Indian war-whoop. In their way home he ventured to remonstrate with his friend on this extraordinary exhibition, to which his defence was, "Dash it, man, they would have thought I was *afraid* to sing before them." In short his egotism, his bold assumption in society, his affectation of neglecting many of its forms as trifles beneath his notice—circumstances which often excited against his first appearance an undue and disproportionate prejudice—were entirely founded upon the resolution to support his independence in society, and to assert that character formed between the lettered scholar and the wild rude borderer, the counterpart as it were of Anacharsis, the philosophic Scythian, which, from his infancy, he was ambitious of maintaining. His humble origin was with him rather a subject of honest pride than of false shame, and he was not unwilling that his deportment should to a certain degree partake of the simplicity of the ranks from which he had raised himself by his talents to bear a share in the first society.

Having thus marked strongly the defects of his manner, and the prejudice which they sometimes excited, we crave credit from the public while we record the real virtues and merits by which they were atoned a thousand-fold. Leyden's apparent harshness of address covered a fund of real affection to his

friends, and kindness to all with whom he mingled, unwearied in their service and watchful to oblige them. To gratify the slightest wish of a friend he would engage at once in the most toilsome and difficult researches, and when perhaps that friend had forgotten that he even intimated such a wish, Leyden came to pour down before him the fullest information on the subject which had excited his attention. And his temper was in reality, and notwithstanding an affectation of roughness, as gentle as it was generous. No one felt more deeply for the distress of those he loved. No one exhibited more disinterested pleasure in their success. In dispute he never lost temper; and if he despised the outworks of ceremony, he never trespassed upon the essentials of good breeding, and was himself the first to feel hurt and distressed if he conceived that he had, by any rash or hasty expression, injured the feelings of the most inconsiderable member of the company. In all the rough play of his argument too he was strictly good-humoured, and was the first to laugh if, as must happen occasionally to those who talk much, and upon every subject, some disputant, of less extensive but more accurate information, contrived to arrest him in his very pitch of pride, by a home fact or incontrovertible argument. And when his high and independent spirit, his firm and steady principles of religion and virtue, his constant good humour, the extent and variety of his erudition, and the liveliness of his conversation were considered, they must have been fastidious indeed who were not reconciled to the foibles or peculiarities of his tone and manner.

Many of those whose genius has raised them to distinction have fallen into the fatal error of regarding their wit and talents as an excuse for the unlimited indulgence of their passions, and their biographers have too frequently to record the acts of extravagance and habits of immorality which disgraced and shortened their lives. From such crimes and follies John Leyden stood free and stainless. He was deeply impressed with the truths of Christianity, of which he was at all times a ready and ardent asserter, and his faith was attested by the purity of morals which is its best earthly evidence. To the pleasures of the table he was totally indifferent, never exceeded the bounds of temperance in wine, though frequently in society where there was temptation to do so, and seemed hardly to enjoy any refreshment excepting tea, of which he sometimes drank very large quantities.¹ When he was travelling or studying his temperance became severe abstinence, and he often passed an entire day without any other food than a morsel of bread. To sleep he was equally indifferent, and when, during the latter part of his residence in Edinburgh, he frequently spent the day in company, he used, upon retiring home, to pursue his studies till a late hour in the morning, and satisfy himself with a very brief portion of repose. It was the opinion of his friends that his strict temperance alone could have enabled him to follow so hard a course of reading as he enjoined himself. His pecuniary resources were necessarily much limited; but he knew that independence, and the title of maintaining a free and uncontrolled demeanour in society, can only be attained by avoiding pecuniary embarrassments, and he managed his funds with such severe economy that he seemed always at ease upon his very narrow income. We have only another trait to add to his character as a member of society. With all his bluntness and peculiarity, and under disadvantages of birth and

¹ A lady whose house he frequented mentioned to a friend of the editor that she had filled him out eighteen cups in one evening.

fortune, Leyden's reception among females of rank and elegance was favourable in a distinguished degree. Whether it is that the tact of the fair sex is finer than ours, or that they more readily pardon peculiarity in favour of originality, or that an uncommon address and manner is in itself a recommendation to their favour, or that they are not so readily offended as the male sex by a display of superior learning—in short, whatever was the cause—it is certain that Leyden was a favourite among those whose favour all are ambitious to attain. Among the ladies of distinction who honoured him with their regard, it is sufficient to notice the Duchess of Gordon and Lady Charlotte Campbell, who were then leaders of the fashionable society of Edinburgh.—It is time to return to trace the brief events of his life.

In 1800 Leyden was ordained a preacher of the gospel, and entered upon the functions then conferred upon him by preaching in several of the churches in Edinburgh and the neighbourhood. His style of pulpit oratory was marked with the same merits and faults which distinguish his poetry. His style was more striking than eloquent, and his voice and gesture more violent than elegant; but his discourses were marked with strong traits of original genius; and although he pleaded an internal feeling of disappointment at being unequal to attain his own ideas of excellence as a preacher, it was impossible to listen to him without being convinced of his uncommon extent of learning, knowledge of ethics, and sincere zeal for the interest of religion.

The autumn of the same year was employed in a tour to the Highlands and Hebrides, in which Leyden accompanied two young foreigners who had studied at Edinburgh the preceding winter. In this tour he visited all the remarkable places of that interesting part of his native country, and diverging from the common and more commodious route, visited what are called the *rough bounds* of the Highlands, and investigated the decaying traditions of Celtic manners and story which are yet preserved in the wild districts of Moidart and Knoidart. The journal which he made on this occasion was a curious monument of his zeal and industry in these researches, and contained much valuable information on the subject of Highland manners and tradition, which is now probably lost to the public. It is remarkable that after long and painful research in quest of original passages of the poems of Ossian, he adopted an opinion more favourable to their authenticity than has lately prevailed in the literary world. But the confessed infidelity of Macpherson must always excite the strongest suspicion on this subject. Leyden composed, with his usual facility, several detached poems upon Highland traditions, all of which have probably perished, excepting a ballad, founded upon the romantic legend respecting MacPhail of Colonsay and the mermaid of Correvrecken, inscribed to Lady Charlotte Campbell, and published in the third volume of the *Border Minstrelsy*, which appeared at the distance of about a twelvemonth after the first two volumes. The opening of this ballad exhibits a power of harmonious numbers which has seldom been excelled in English poetry. Nor were these legendary effusions the only fruit of his journey; for in his passage through Aberdeen Leyden so far gained the friendship of the venerable Professor Beattie, that he obtained his permission to make a transcript from the only existing copy of the interesting poem entitled “Albania.” This work, which is a panegyric on Scotland in nervous blank verse, written by an anonymous author some time in the beginning of the eighteenth century, Leyden afterwards republished, along with Wilson’s “Clyde,”

under the title of *Scottish Descriptive Poems*, 12mo, 1802.

In 1801, when Mr. Lewis published his *Tales of Wonder*, Leyden was a contributor to that collection, and furnished the ballad called the “Elf-king;” and in the following year he employed himself earnestly in the congenial task of procuring materials for the *Minstrelsy of the Scottish Border*, the first publication of Walter Scott. In this labour he was equally interested by friendship for the editor, and by his own patriotic zeal for the honour of the Scottish borders, and both may be judged of from the following circumstance. An interesting fragment had been obtained of an ancient historical ballad, but the remainder, to the great disturbance of the editor and his coadjutor, was not to be recovered. Two days afterwards, while Mr. Scott was sitting with some company after dinner, a sound was heard at a distance like that of the whistling of a tempest through the torn rigging of the vessel which scuds before it. The sounds increased as they approached more near, and Leyden (to the great astonishment of such of the guests as did not know him) burst into the room, chanting the desiderated ballad with the most enthusiastic gesture, and all the energy of the saw-tones of his voice already commemorated. It turned out that he had walked between forty and fifty miles and back again, for the sole purpose of visiting an old person who possessed this precious remnant of antiquity. His antiquarian researches and poetic talents were also liberally exerted for the support of this undertaking. To the former the reader owes in a great measure the “Dissertation on Fairy Superstition,” which, although arranged and digested by Mr. Scott, abounds with instances of such curious reading as Leyden alone had read, and was originally compiled by him; and to the latter the spirited ballads entitled “Lord Soulis” and the “Cout of Keeldar.”

Leyden's next publication was “*The Complaint of Scotland*,” a new edition of an ancient and singularly rare tract bearing that title, written by an uncertain author about the year 1548.” This curious work was published by Mr. Constable in the year 1801. As the tract was itself of a diffuse and comprehensive nature, touching upon many unconnected topics, both of public policy and private life, as well as treating of the learning, the poetry, the music, and the arts of that early period, it gave Leyden an opportunity of pouring forth such a profusion of antiquarian knowledge in the preliminary dissertation, notes, and glossary, as one would have thought could hardly have been accumulated during so short a life, dedicated too to so many and varied studies. The intimate acquaintance which he has displayed with Scottish antiquities of every kind, from manuscript histories and rare chronicles, down to the tradition of the peasant and the rhymes even of the nursery, evince an extent of research, power of arrangement, and facility of recollection, which has never been equalled in this department.

Meanwhile other pursuits were not abandoned in the study of Scottish antiquities. The *Edinburgh Magazine* was united in 1802 with the old *Scots Magazine*, and was now put under the management of Leyden by Mr. Constable the publisher. To this publication during the period of his management, which was about five or six months, he contributed several occasional pieces of prose and poetry, in all of which he was successful, excepting in those where humour was required, which, notwithstanding his unvaried hilarity of temper, Leyden did not possess. He was also, during this year, engaged with his *Scenes of Infancy*, a poem which was afterwards published on the eve of his leaving Britain; and in which

he has interwoven his own early feelings and recollections with the description and traditional history of his native vale of Teviot.

The friends of Leyden began now to be anxious for his present settlement in life. He had been for two years in orders, and there was every reason to hope that he might soon obtain a church through the numerous friends and powerful interest which he now possessed. More than one nobleman of high rank expressed a wish to serve him should any church in their gift become vacant; and, from the recommendation of other friends to those possessed of political interest, he was almost assured of being provided for by a crown presentation on some early opportunity. But his eager desire of travelling, and of extending the bounds of literary and geographical knowledge, had become, as he expressed himself to an intimate friend, "his thought by day and his dream by night, and the discoveries of Mungo Park haunted his very slumbers." When the risk was objected to him, he used to answer in a phrase of Ossian, "Dark Cuchullin will be renowned or dead;" and it became hopeless to think that this eager and aspiring spirit could be confined within the narrow sphere, and limited to the humble though useful duties, of a country clergyman. It was therefore now the wish of his friends to turn this irresistible thirst for discovery into some channel which might at once gratify the predominant desire of his heart, and be attended with some prospect of securing his fortune. It was full time to take such steps; for in 1802 Leyden had actually commenced overtures to the African Society, for undertaking a journey of discovery through the interior of that continent—an enterprise which sad examples have shown to be little better than an act of absolute suicide. To divert his mind from this desperate project, a representation was made to the Right Hon. William Dundas, who had then a seat at the Board of Control, stating the talents and disposition of Leyden, and it was suggested that such a person might be usefully employed in investigating the language and learning of the Indian tribes. Mr. Dundas entered with the most liberal alacrity into these views; but it happened, unfortunately as it might seem, that the sole appointment then at his disposal was that of surgeon's assistant, which could only be held by a person who had taken a surgical degree, and could sustain an examination before the medical board at the India House. It was upon this occasion that Leyden showed, in their utmost extent, his wonderful powers of application and comprehension. He at once intimated his readiness to accept the appointment under the conditions annexed to it, and availing himself of the superficial information he had formerly acquired by a casual attendance upon one or two of the medical classes, he gave his whole mind to the study of medicine and surgery, with the purpose of qualifying himself for his degree in the short space of five or six months. The labour which he underwent on this occasion was incredible; but with the powerful assistance of a gentleman of the highest eminence in his profession (Mr. John Bell of Edinburgh), he succeeded in acquiring such a knowledge of this complicated and most difficult art, as enabled him to obtain his diploma as surgeon with credit, even in the city of Edinburgh, so long famed for its medical school, and for the wholesome rigour adopted in the distribution of degrees. Leyden was, however, incautious in boasting of his success after so short a course of study, and found himself obliged, in consequence of his imprudence, to relinquish his intention of taking out the degree of M.D. at Edinburgh, and to have recourse to another Scottish university

for that step in his profession. Meanwhile the sudden exchange of his profession gave great amusement to some of his friends, especially when a lady having fainted in a crowded assembly, Dr. Leyden advanced to her assistance, and went through the usual routine of treatment with all the gravity which bebecmed his new faculty. In truth, the immediate object of his studies was always, in season and out of season, predominant in Leyden's mind, and just about this time he went to the evening party of a lady of the highest rank with the remnants of a human hand in his pocket, which he had been dissecting in the morning; and on some question being stirred about the muscular action, he was with difficulty withheld from producing this grisly evidence in support of the argument which he maintained. The character of Leyden cannot be understood without mentioning those circumstances that are allied to oddity; but it is not so easy to body forth those qualities of energy, application, and intelligence, by which he dignified his extravagancies, and vindicated his assumption of merit, far less to paint his manly, generous, and friendly disposition.

In December, 1802, Leyden was summoned to join the Christmas fleet of Indians, in consequence of his appointment as assistant-surgeon on the Madras establishment. It was sufficiently understood that his medical character was only assumed to bring him within the compass of Mr. Dundas's patronage, and that his talents should be employed in India with reference to his literary researches. He was, however, *pro forma*, nominated to the Madras Hospital. While awaiting this call, he bent his whole energies to the study of the oriental languages, and amused his hours of leisure by adding to the *Scenes of Infancy* many of those passages addressed to his friends, and bearing particular reference to his own situation on the eve of departure from Scotland, which, flowing warm from the heart, constitute the principal charm of that impressive poem. Mr. James Ballantyne, an early and intimate friend of Leyden, had just then established in Edinburgh his press, which afterwards became so distinguished. To the critical skill of a valued and learned friend, and to the friendly as well as professional care of Ballantyne, Leyden committed this last memorial of his love to his native land. The last sheets reached him before he left Britain, no more to return.

About the middle of December John Leyden left Edinburgh, but not exactly at the time he had proposed. He had taken a solemn farewell of his friends, and gone to Roxburghshire to bid adieu to his parents, whom he regarded with the most tender filial affection, and from thence he intended to have taken his departure for London without returning to Edinburgh. Some accident changed his purpose, and his unexpected arrival in Edinburgh was picturesque and somewhat startling. A party of his friends had met in the evening to talk over his merits, and to drink, in Scottish phrase, his *bonallie*. While about the witching hour they were crowning a solemn bumper to his health, a figure burst into the room, muffled in a seaman's cloak and travelling cap, covered with snow, and distinguishable only by the sharpness and ardour of the tone with which he exclaimed, "Dash it, boys, here I am again!" The start with which this unexpected apparition was received was subject of great mirth at the time, and the circumstance was subsequently recalled by most of the party with that mixture of pleasure and melancholy which attaches to the particulars of a last meeting with a beloved and valuable friend.

In London, the kindness of Mr. Heber, his own reputation, and the recommendation of his Edin-

burgh friends, procured Leyden much kindness and attention among persons of rank and literary distinction. His chief protector and friend, however, was Mr. George Ellis, the well-known editor of the *Specimens of Ancient English Poetry*. To this gentleman he owed an obligation of the highest possible value, in a permission which he kindly granted him to change, on account of illness, from one vessel to another, the former being afterwards unfortunately cast away in going down the river, when many of the passengers were drowned.

After this providential exchange of destination, the delay of the vessel to which he was transferred permitted his residence in London until the beginning of April, 1803, an interval which he spent in availing himself of the opportunities which he now enjoyed of mixing in the most distinguished society in the metropolis, where the novelty and good humour of his character made ample amends for the native bluntness of his manners. In the beginning of April he sailed from Portsmouth in the *Hugh Inglis*, where he had the advantage of being on board the same vessel with Mr. Robert Smith, the brother of his steady friend the Rev. Mr. Sidney Smith. And thus set forth on his voyage perhaps the first British traveller that ever sought India moved neither by the love of wealth nor of power, and who, despising alike the luxuries commanded by the one and the pomp attached to the other, was guided solely by the wish of extending our knowledge of oriental literature, and distinguishing himself as its most successful cultivator. This pursuit he urged through health and through sickness, unshaken by all the difficulties arising from imperfect communication with the natives, from their prejudices and those of their European masters, and from frequent change of residence; unmoved either by the charms of pleasure, of wealth, or of that seducing indolence to which many men of literature have yielded after overcoming all other impediments. To this pursuit he finally fell a sacrifice, as devoted a martyr in the cause of science as ever died in that of religion. We are unable to trace his Indian researches and travels with accuracy similar to that with which we have followed those which preceded his departure from Europe, but we are enabled to state the following outlines of his fortune in the East.

After a mutiny in the vessel, which was subdued by the exertions of the officers and passengers, and in which Leyden distinguished himself by his coolness and intrepidity, the *Hugh Inglis* arrived at Madras, and he was transferred to the duties of his new profession. His nomination as surgeon to the commissioners appointed to survey the ceded districts seemed to promise ample opportunities for the cultivation of oriental learning. But his health gave way under the fatigues of the climate; and he has pathetically recorded, in his *Address to an Indian Gold Coin*, the inroads which were made on his spirits and constitution. He was obliged to leave the presidency of Madras, suffering an accumulation of diseases, and reached with difficulty Prince of Wales Island. During the passage the vessel was chased by a French privateer, which was the occasion of Leyden's composing, in his best style of border enthusiasm, an *Ode to a Malay Cris*, or dagger, the only weapon which his reduced strength now admitted of his wielding. The following letter to Mr. Ballantyne, dated from Prince of Wales Island, 24th October, 1805, gives a lively and interesting account of his occupations during the first two years of his residence in India.

"*Pulao Penang, October 24th. 1805.*

"My dear Ballantyne,—Finding an extra India-

man, the *Revenge*, which has put into this harbour in distress, bound to Europe, I take another opportunity of attempting to revive, or rather commence, an intercourse with my European friends, for since my arrival in India I have never received a single scrap from one of them,—Proh Deum! Mr. Constable excepted; and my friend Erskine writes me from Bombay, that none of you have received the least intelligence of my motions since I left Europe. This is to me utterly astonishing and incomprehensible, considering the multitude of letters and parcels that I have despatched from Mysore, especially during my confinement for the liver disease at Seringapatam, where I had for some months the honour of inhabiting the palace of Tippoo's prime minister. I descended into Malabar in the beginning of May, in order to proceed to Bombay, and perhaps eventually up the Persian Gulf as far as Bassorah, in order to try the effect of a sea voyage. I was, however, too late, and the rains had set in, and the last vessels sailed two or three days before my arrival. As I am always a very lucky fellow, as well as an unlucky one, which all the world knows, it so fell out that the only vessel which sailed after my arrival was wrecked, while some secret presentiment, or rather 'sweet little cherub, that sits up aloft,' prevented my embarking on board of her. I journeyed leisurely down to Calicut from Cananore, intending to pay my respects to the cutwall and the admiral, so famous in the *Lusiad* of Camoens; but only think of my disappointment when I found that the times are altered, and the tables turned with respect to both these sublime characters. The cutwall is only a species of borough-bailiff, while the admiral, God help him, is only the chief of the fishermen. From Calicut I proceeded to Paulgautherry, which signifies in the Tamal language 'the town of the forest of palms,' which is exactly the meaning of *Tadmor*, the name of a city founded by Solomon, not for the Queen of Sheba, but as it happened, for the equally famous Queen Zenobia. Thus having demonstrated that Solomon understood the Tamal language, we may proceed to construct a syllogism in the following manner: 'Solomon understood the Tamal language, and he was wise—I understand the Tamal language, therefore I am as wise as Solomon!' I fear you logical lads of Europe will be very little disposed to admit the legitimacy of the conclusion; but, however the matter may stand in Europe, I can assure you it's no bad reasoning for India. At Paulgautherry I had a most terrible attack of the liver, and should very probably have passed away, or, as the Indians say, changed my climate—an elegant periphrasis for dying, however—had I not obstinately resolved on living to have the pleasure of being *revenged* on all of you for your obstinate silence and 'perseverance therein to the end.' Hearing about the middle of August that a Bombay cruiser had touched at Aleppo, between Quilod and Cochín, I made a desperate push through the jungles of the Cochín rajah's country, in order to reach her, and arrived about three hours after she had set sail. Anybody else would have died of chagrin, if they had not hanged themselves outright. I did neither one nor the other, but 'tuned my pipes and played a spring to John o' Badenyon;' after which I set myself coolly down and translated the famous Jewish tablets of brass, preserved in the synagogue of Cochín ever since the days of Methusalem. Probably you may think this no more difficult a task than deciphering the brazen tablet on any door of Princes or Queen Street. But here I beg your pardon; for, so far from anybody, Jew, Pagan, or Christian, having ever been able to do this before, I assure you the

most learned men of the world have never been able to decide in what language, or in what alphabet, they were written. As the character has for a long time been supposed to be antediluvian, it has for a long time been as much despised of as the Egyptian hieroglyphics. So much was the diwan or grand vizier, if you like it, of Travancore astonished at the circumstance, that he gave me to understand that I had only to *pass through the sacred cow* in order to merit adoption into the holy order of Bramins. I was forced, however, to decline the honour of the sacred cow, for unluckily Phalaris' bull and Moses' calf presented themselves to my imagination, and it occurred to me that perhaps the Ram-rajah's cow might be a beast of the breed. Being on the eve of a new attack of the liver, I was forced to leave Travancore with great precipitation, in the first vessel that presented itself, a Mapella brig bound to Puloo Penang, the newly erected presidency on the Straits of Malacca, where I have just arrived, after a perverse pestilent voyage, in which I have been terribly ill of revulsions of bile and liver, without any of the conveniences which are almost necessary to a European in these parts, and particularly to an invalid. We have had a very rough passage, the cabin very often all afloat, while I have been several times completely drenched. In addition to this we have been pursued by a Frenchman, and kept in a constant state of alarm and agitation; and now, to mend the matter, I am writing you at a kind of naval tavern, while all around me is ringing with the vociferation of tarpaulins, the hoarse bawling of sea-oaths, and the rattling of the dice-box. However, I flatter myself I have received considerable benefit from the voyage, tedious and disgusting and vexatious as it has been. . . .

"You know when I left Scotland, I had determined at all events to become a furious orientalist, '*nemini secundus*,' but I was not aware of the difficulty. I found the expense of native teachers would prove almost insurmountable to a mere assistant-surgeon, whose pay is seldom equal to his absolutely necessary expenses; and, besides, that it was necessary to form a library of MSS. at a most terrible expense, in every language to which I should apply, if I intended to proceed beyond a mere smattering. After much consideration, I determined on this plan at all events, and was fortunate enough in a few months to secure an appointment which furnished me with the means of doing so, though the tasks and exertions it imposed on me were a good deal more arduous than the common duties of a surgeon even in a Mahratta campaign: I was appointed medical assistant to the Mysore survey, and at the same time directed to carry on inquiries concerning the natural history of the country, and the manners and languages, &c., of the natives of Mysore. This you would imagine was the very situation I wished for; and so it would, had I previously had time to acquire the country languages. But I had them now to acquire after severe marches and countermarches in the heat of the sun, night-marches and day-marches, and amid the disgusting details of a field-hospital, the duties of which were considerably arduous. However, I wrought incessantly and steadily, and without being discouraged by any kind of difficulty, till my health absolutely gave way; and when I could keep the field no longer, I wrought on my couch, as I generally do still, though I am much better than I have been. As I had the assistance of no intelligent Europeans, I was obliged long to grope my way; but I have now acquired a pretty correct idea of India in all its departments, which increases in geometrical progression as I advance in the languages. The languages

that have attracted my attention since my arrival have been Arabic, Persic, Hindostanee, Mahratta, Tamal, Telinga, Canara, Sanscrit, Malayalam, Malay, and Armenian. You will be ready to ask where I picked up these hard names, but I assure you it is infinitely more difficult to pick up the languages themselves, several of which include dialects as different from each other as French or Italian from Spanish or Portuguese; and in all these I flatter myself I have made considerable progress. What would you say were I to add the Maldivian and Mapella languages to these? Besides, I have deciphered the inscriptions of Mavalipoorani, which were written in an ancient Canara character that had hitherto defied all attempts at understanding it, and also several *Lada Lippi* inscriptions, which is an ancient Tamal dialect and character, in addition to the Jewish tablets of Cochin, which were in the ancient Malayalam, generally termed Malabar. I enter into these details merely to show you that I have not been idle, and that my time has neither been dissipated, nor devoid of plan, though that plan is not sufficiently unfolded. To what I have told you of, you are to add constant and necessary exposure to the sun, damps and dews from the jungles, and putrid exhalations of marshes, before I had been properly accustomed to the climate, constant rambling in the haunts of tigers, leopards, bears, and serpents of 30 or 40 feet long, that make nothing of swallowing a buffalo, by way of demonstrating their appetite in a morning, together with smaller and more dangerous snakes, whose haunts are dangerous, and bite deadly; and you have a faint idea of a situation in which, with health, I lived as happy as the day was long. It was occasionally diversified with rapid jaunts of a hundred miles or so, as fast as horses or bearers could carry me, by night or day, swimming through rivers, afloat in an old brass kettle, at midnight! O! I could tell you adventures to outrival the witch of Endor, or any witch that ever swam in egg-shell or sieve; but you would undoubtedly imagine I wanted to impose on you were I to relate what I have seen and passed through. No! I certainly shall never repent of having come to India. It has awakened energies in me that I scarcely imagined I possessed, though I could gnaw my living nails with pure vexation to think how much I have been thwarted by indisposition. If, however, I get over it, I shall think the better of my constitution as long as I live. It is not every constitution that can resist the combined attack of liver, spleen, bloody flux, and jungle-fever, which is very much akin to the plague of Egypt and yellow fever of America. It is true I have been five times given up by the most skilful physicians in these parts; but in spite of that I am firmly convinced that 'my doom is not to die this day.' You are to commend me kindly to your good motherly mother, and tell her I wish I saw her oftener, and then to your brother Alexander, and request him sometimes, on a Saturday night, precisely at eight o'clock, for my sake, to play 'Gingling Johnny' on his flageolet. If I had you both in my tent you should drink yourself drunk with wine of Shiraz, which is our eastern Falernian, in honour of Hafiz, our Persian Anacreon. As for me, I often drink your health in *water* (ohon a ree!), having long abandoned both wine and animal food, not from choice, but dire necessity—Adieu, dear Ballantyne, and believe me, in the Malay Isles, to be ever yours sincerely,

JOHN LEYDEN."

Leyden soon became reconciled to Puloo Penang (or Prince of Wales Island), where he found many valuable friends, and enjoyed the regard of Philip Dundas, Esq., then governor of the island. He

resided in that island for some time, and visited Achi, with some other places on the coasts of Sumatra and the Malayan peninsula. Here he amassed the curious information concerning the language, literature, and descent of the Indi-Chinese tribes, which afterwards enabled him to lay before the Asiatic Society at Calcutta a most valuable dissertation on so obscure a subject.

In 1806 he took leave of Penang, regretted by many friends, whom his eccentricities amused, his talents enlightened, and his virtues conciliated. His reception at Calcutta, and the effect which he produced upon society there, are so admirably illustrated by his ingenious and well-known countryman Sir John Malcolm, that it would be impossible to present a more living picture of his manners and mind, and the reader will pardon some repetition for the sake of observing how the same individual was regarded in two distant hemispheres.

"TO THE EDITOR OF THE BOMBAY COURIER." 11

"It is not easy to convey an idea of the method which Dr. Leyden used in his studies, or to describe the unconquerable ardour with which these were pursued. During his early residence in India I had a particular opportunity of observing both. When he read a lesson in Persian, a person near him, whom he had taught, wrote down each word on a long slip of paper, which was afterwards divided into as many pieces as there were words, and pasted in alphabetical order, under different heads of verbs, nouns, &c., into a blank book that formed a vocabulary of each day's lesson. All this he had in a few hours instructed a very ignorant native to do; and this man he used, in his broad accent, to call 'one of his mechanical aids.' He was so ill at Mysore, soon after his arrival from England, that Mr. Anderson, the surgeon who attended him, despaired of his life; but though all his friends endeavoured at this period to prevail upon him to relax in his application to study, it was in vain. He used, when unable to sit upright, to prop himself up with pillows, and continue his translations. One day that I was sitting by his bedside the surgeon came in.—'I am glad you are here,' said Mr. Anderson, addressing himself to me, 'you will be able to persuade Leyden to attend to my advice. I have told him before, and now I repeat, that he will die if he does not leave off his studies and remain quiet.' 'Very well, doctor,' exclaimed Leyden; 'you have done your duty, but you must now hear me: *I cannot be idle*, and whether I die or live, the wheel must go round till the last;' and he actually continued, under the depression of a fever and a liver complaint, to study more than ten hours each day.

"The temper of Dr. Leyden was mild and generous, and he could bear with perfect good humour railery on his foibles. When he arrived at Calcutta in 1805 I was most solicitous regarding his reception in the society of the Indian capital. 'I entreat you, my dear friend,' I said to him the day he landed, 'to be careful of the impression you make on your entering this community; for God's sake learn a little English, and be silent upon literary subjects, except among literary men.' 'Learn English!' he exclaimed 'no, never; it was trying to learn that language that spoilt my Scotch; and as to being silent, I will promise to hold my tongue, if you will make fools hold theirs.'

"His memory was most tenacious, and he sometimes loaded it with lumber. When he was at My-

sores an argument occurred upon a point of English history; it was agreed to refer it to Leyden, and to the astonishment of all parties he repeated verbatim the whole of an act of parliament in the reign of James relative to Ireland, which decided the point in dispute. On being asked how he came to charge his memory with such extraordinary matter, he said that several years before, when he was writing on the changes that had taken place in the English language, this act was one of the documents to which he had referred as a specimen of the style of that age, and that he had retained every word in his memory.

"His love of the place of his nativity was a passion in which he had always a pride, and which in India he cherished with the fondest enthusiasm. I once went to see him when he was very ill and had been confined to his bed for many days; there were several gentlemen in the room; he inquired if I had any news; I told him I had a letter from Eskdale. 'And what are they about in the borders?' he asked. 'A curious circumstance,' I replied, 'is stated in my letter;' and I read him a passage which described the conduct of our volunteers on a fire being kindled by mistake at one of the beacons. This letter mentioned that the moment the blaze, which was the signal of invasion, was seen, the mountaineers hastened to their rendezvous, and those of Liddesdale swam the Liddle river to reach it. They were assembled (though several of their houses were at a distance of six and seven miles) in two hours, and at break of day the party marched into the town of Hawick (at a distance of twenty miles from the place of assembly), to the border tune of '*Wha daur meddle wi' me?*' Leyden's countenance became animated as I proceeded with this detail, and at its close he sprang from his sick-bed, and with much strange melody, and still stranger gesticulations, sung aloud, '*Wha daur meddle wi' me? wha daur meddle wi' me?*' Several of those who witnessed this scene looked at him as one that was raving in the delirium of a fever.

"These anecdotes will display more fully than any description I can give, the lesser shades of the character of this extraordinary man. An external manner certainly not agreeable, and a disposition to egotism, were his only defects. How trivial do these appear at a moment when we are lamenting the loss of such a rare combination of virtues, learning, and genius, as were concentrated in the late Dr. Leyden!

"JOHN MALCOLM."

We have little to add to General Malcolm's luminous and characteristic sketch. The efficient and active patronage of Lord Minto, himself a man of letters, a poet, and a native of Teviotdale, was of the most essential importance to Leyden, and no less honourable to the governor-general. Leyden's first appointment as a professor in the Bengal College might appear the sort of promotion best suited to his studies, but was soon exchanged for that of a judge of the twenty-four pergunnahs of Calcutta. In this capacity he had a charge of police, which "jumped with his humour well," for the task of pursuing and dispersing the bands of robbers who infest Bengal had something of active and military duty. He also exercised a judicial capacity among the natives, to the discharge of which he was admirably fitted by his knowledge of their language, manners, and customs. To this office a very considerable yearly income was annexed. This was neither expended in superfluities, nor even in those ordinary expenses which the fashion of the East has pronounced indispensable; for Dr. Leyden kept no establishment, gave no entertainments, and was, with the receipt of this revenue, the very same simple,

¹ We omit the earlier portion of this letter, referring to the general character and manners of Leyden.

frugal, and temperate student which he had been at Edinburgh. But, exclusive of a portion remitted home for the most honourable and pious purpose, his income was devoted to the pursuit which engaged his whole soul; to the increase, namely, of his acquaintance with eastern literature in all its branches. The expense of native teachers of every country and dialect, and that of procuring from every quarter oriental manuscripts, engrossed his whole emoluments, as the task of studying under the tuition of the interpreters, and deciphering the contents of the volumes, occupied every moment of his spare time. "I may die in the attempt," he writes to a friend, "but if I die without surpassing Sir William Jones a hundred-fold in oriental learning, let never a tear for me profane the eye of a borderer." The term was soon approaching when these regrets were to be bitterly called forth, both from his Scottish friends and from all who viewed with interest the career of his ardent and enthusiastic genius, which, despising every selfish consideration, was only eager to secure the fruits of knowledge, and held for sufficient reward the fame of having gathered them.

Dr. Leyden accompanied the governor-general upon the expedition to Java (August, 1811), for the purpose of investigating the manners, language, and literature of the tribes which inhabit that island, and partly also because it was thought his extensive knowledge of the eastern dialects and customs might be useful in settling the government of the country, or in communicating with the independent princes in the neighbourhood of the Dutch settlements. His spirit of romantic adventure led him literally to rush upon death; for, with another volunteer who attended the expedition, he threw himself into the surf, in order to be the first Briton of the expedition who should set foot upon Java. When the success of the well-concerted movements of the invaders had given them possession of the town of Batavia, Leyden displayed the same ill-omened precipitation in his haste to examine a library in which many Indian manuscripts of value were said to be deposited. A library, in a Dutch settlement was not, as might have been expected, in the best order, the apartment had not been regularly ventilated, and, either from this circumstance, or already affected by the fatal sickness peculiar to Batavia, Leyden, when he left the place, had a fit of shivering, and declared the atmosphere was enough to give any mortal a fever. The presage was too just; he took his bed, and died in three days (August 28), on the eve of the battle which gave Java to the British empire.

Thus died John Leyden, in the moment perhaps most calculated to gratify the feelings which were dear to his heart; upon the very day of military glory, and when every avenue of new and interesting discovery was opened to his penetrating research. In the emphatic words of Scripture, "the bowl was broken at the fountain." His literary remains were intrusted by his last will to the charge of Mr. Heber and Dr. Hare of Calcutta, his executors. They are understood to contain two volumes of poetry, with many essays on oriental and general literature. His remains, honoured with every respect by Lord Minto, now repose in a distant land, far from the green-sod graves of his ancestors at Hazeldean, to which, with a natural anticipation of such an event, he bids an affecting farewell in the solemn passage which concludes the *Scenes of Infancy*—

"The silver moon, at midnight cold and still,
Looks, sad and silent, o'er yon western hill;
While large and pale the ghostly structures grow,
Reared on the confines of the world below.

Is that dull sound the hum of Teviot's stream?
Is that blue light the moon's or tomb-fire's gleam,
By which a mouldering pile is faintly seen,
The old deserted church of Hazeldean,
Where slept my fathers in their natal clay,
Till Teviot's waters roll'd their bones away?
Their feeble voices from the stream they raise,
'Rash youth! unmindful of thy early days,
Why didst thou quit the peasant's simple lot?
Why didst thou leave the peasant's turf-built cot,
The ancient graves, where all thy fathers lie,
And Teviot's stream, that long has murmured by?
And we—when Death so long has closed our eyes
How wilt thou bid us from the dust arise,
And bear our mouldering bones across the main,
From vales that knew our lives devoid of stain?
Rash youth! beware, thy home-bred virtues save,
And sweetly sleep in thy paternal grave!"

Such is the language of nature moved by the kindly associations of country and of kindred affections. But the best epitaph is the story of a life engaged in the practice of virtue and the pursuit of honourable knowledge; the best monument, the regret of the worthy and of the wise; and the rest may be summed up in the sentiment of Sannazario.

"Hæccine te fessum tellus extrema manebat
Hospitii post tot terræque marisque labores?
Pone tamen gemitus, nec te monumenta parentum
Aut movent sperata tuis tibi funera regnis,
Grata quies patriæ; sed et omnis terra sepulchrum."

To this eloquent and highly picturesque memoir, upon which we have drawn so largely, it is only to be added, that the *Poetical Remains* of Dr. Leyden were published in one volume 8vo, in 1819, with a memoir by the Rev. James Morton; and that another posthumous work, entitled *Memoirs of the Emperor Baber*, and commemorating for the first time an Indian hero little inferior to Cæsar or Napoleon, but heretofore totally unknown in Europe, in which he had had the co-operation of his friend Mr. William Erskine, appeared at Edinburgh in 1826.

LIDDEL, DR. DUNCAN, a physician of eminence, was born in Aberdeen in the year 1761, and was son to a respectable citizen of that town.¹ He received his education at the schools, and the university of King's College, in his native city. In the year 1779, at the early age of eighteen, he visited the Continent, passing over to Dantzic, whence he travelled through Poland to Frankfort-on-the-Oder, where he had the good fortune to meet with a beneficent countryman, Dr. John Craig, afterwards physician to James VI., who then taught logic and mathematics. His views, which were previously wavering, were fixed by the kind attention and assistance of his friend, who enabled him to study mathematics, philosophy, and medicine for three years in the university of Frankfort, where Craig was himself a professor. In 1782 Craig proposing to return to Scotland, his pupil proceeded to prosecute his studies at Breslau in Silesia, under the conduct of a statesman at that period of considerable note—Andreas Dudithius, to whose attention his zealous countryman had recommended him. In this new sphere of exertion he is said to have made extensive progress in his favourite study of the mathematics, under the tuition of Professor Paulus Wittichius. After spending somewhat more than a year at Breslau he returned to Frankfort, where he again turned his attention to medicine, and commenced a

¹ Inscription on a brass plate in the church of St. Nicholas, Aberdeen; *Sketch of the Life of Dr. Duncan Liddel, Aberdeen, 1790*. This pamphlet, understood to have been written by Mr. John Stewart, professor of Greek in Marischal College, gives so accurate and concise an account of its subject, that little can be added. We are aware of but one work having any reference to Liddel which has been overlooked. The *Litteræ ad Joannem Keplermum* contain one or two letters from him.

course of private tuition in mathematics and philosophy. A contagious distemper which broke out at Frankfort in 1587, dispersing the students in various directions, induced him to change his place of residence for the celebrated university of Rostock. Here he appears to have first acquired celebrity for his professional knowledge and conversational information, and particularly for his knowledge of astronomy and mathematics. He became the companion and pupil of Bruceus, a physician and philosopher of Flanders, who, although the senior of Liddel both in years and celebrity, acknowledges himself to have received much useful information and assistance from the young philosopher; while Caselius, another companion and friend of Liddel, pays a tribute to the comprehensiveness of his genius and reading, by remarking that "he was the first person in Germany who explained the motions of the heavenly bodies according to the three different hypotheses of Ptolemy, Copernicus, and Tycho Brahe."

The illustrious individual last mentioned had likewise studied at the university of Rostock: it is probable that the pursuits of the two philosophers brought them into contact, and the author of the biography of Liddel considers it sufficiently established, that they were intimate with each other in after-life, and that the Danish philosopher frequently visited the subject of our memoir in his journeys to Scotland. There is, however, a shadow of authority for supposing¹ that Liddel held the higher rank of an opponent of Tycho Brahe, and maintained a disputation with him on equal terms. The eccentric Sir Thomas Urquhart, who, whatever information he may have chosen to receive on the subject, certainly was enabled to have made himself master of the true state of the circumstances which he related, says, "These mathematical blades put me in mind of that Dr. Liddel, who, for his profoundness in those sciences of sensible immaterial objects, was everywhere much renowned, especially at Frankfort-de-Main, Frankfort-on-the-Oder, and Heidelberg, where he was almost as well known as the monstrous bacchanalian tun that stood there in his time. He was an eminent professor of mathematics, a disciple of the most excellent astronomer Tycho Brahe, and condisciple of that worthy Longomontanus; yet in imitation of Aristotle (whose doctrine with great proficiency he had imbued), he esteemed more of truth than either of Socrates or Plato; when the new star began to appear in the constellation of Cassiopeia, there was concerning it such an intershocking of opinions betwixt Tycho Brahe and Dr. Liddel, evulged in print to the open view of the world, that the understanding reader could not but have commended both for all; and yet (in giving each his due) praised Tycho Brahe most for astronomy, and Liddel for his knowledge above him in all the other parts of philosophy." It is not improbable that the imaginative author of the *Jewel* may have thought proper, without much inquiry, to bestow on a person born in his own near neighbourhood the merit of a conflict in which a Scotsman, whose name may not have then been known, was engaged; at the same time adding to the lustre of the achievements of his countryman. The author of the life of Dr. Liddel observes, "Upon what authority this circumstance is founded cannot be discovered, for there is no mention of it in either of the very full accounts of the life and writings of Tycho Brahe by Gassendi and Montucla, nor in a large volume written by Tycho himself concerning this new star; although he there animadverts at

great length upon the opinions of many other astronomers who had also treated of it. Nor could any such controversy have possibly happened at the time mentioned by Sir Thomas Urquhart, for the new star there spoken of was observed by Tycho Brahe in 1572, and the account of it published in 1573, when Dr. Liddel was only twelve years of age. There is indeed, in the volume of *Astronomical Epistles* of Tycho Brahe, a long letter from him to his friend Rothmannus, chiefly filled with severe reflections upon the publications of a certain Scotsman against his account of the comet of 1577, not of the new star in Cassiopeia; but it appears from Gassendi that this Scottish writer was Dr. Craig, formerly mentioned, and not Dr. Liddel." When we recollect that Liddel and Craig, as intimate literary associates, may have imbibed the same theories, and similar methods of stating them, this last circumstance approaches a solution of the difficulty.

In the university of Rostock Liddel received the degree of Master of Philosophy, and in 1590 he left it to return to Frankfort, at the request of two young Livonians of rank, to whom it is probable he acted as tutor. He did not long remain at Frankfort on his second visit, having heard of the rising fame of the new "*Academia Julia*," founded at Helmstadt by Henry Julius, Duke of Brunswick, in 1576. Here he accompanied his pupils, and was restored to the company of his old friend Caselius, whom the duke had invited to his youthful establishment.

In 1591 Liddel, by the recommendation of his friend, and of Grunefeldt, an eminent civilian, was appointed to the lower professorship of mathematics in the new university, as successor to Parcovius, who had been removed to the faculty of medicine; and, on the death of Erhardus Hoffman in 1594, he succeeded to the first or higher mathematical chair. This eminent station he filled during the course of nine years, giving instructions in geometry, astronomy, and universal geography, and keeping the information he communicated to his pupils on a level with the dawning progress of discovery. In 1596 he obtained the degree of Doctor in Medicine; and, in a science which was not at that period considered as so completely abstracted from the circle of general knowledge as its practical extent now compels it to be, he acquired the same celebrity which he had achieved in philosophy and mathematics. He is said by his lectures and writings to have proved the chief support of the medical school of Helmstadt; he acted as first physician to the court of Brunswick, and enjoyed a lucrative private practice among the opulent families in the neighbourhood. In 1599 he was elected dean of the faculty of philosophy, a post of honour to which he was frequently re-elected, both by the faculties of philosophy and of medicine. Meanwhile, in the year 1603, he resigned to Henricus Schaperus the chair of mathematics, of which he had remained occupant, notwithstanding his labours in another science; and in the year following he was chosen pro-rector of the university. The method of studying his profession, and his courses of public tuition, had already made Liddel an author of no inconsiderable extent, and about this period the fame he had acquired probably induced him to present the academical works which he had written or superintended in a distinct manner before the world. In 1605 was published *Disputationes Medicinales Duncani Liddellii Scoti, Phil. et Med. Doctoris, et Professoris Publici in Academia Julia Helmestadtii*. This work, filling four volumes 4to, contains the theses or public disputations maintained by himself and his pupils at Helmstadt from 1592 to 1606; it is dedicated as a

¹ On the authority of Caselius' dedication to Craig, and the funeral oration on Liddel.

mark of gratitude to his early friend and patron Craig, accompanied by the usual multitude of commendatory verses on the author and his works. This book is mentioned by the author of the memoirs of Liddel as having been reprinted at so late a period as 1720. In 1607 he produced a better-known work, *Ars Medica, Succincte et Perspicue Explicata*, published at Hamburg. This work was dedicated to King James. A second edition was published at Lyons in 1624, and a third at Hamburg in 1628. As in other works on medicine of the period, the range of the author's investigation was not confined to subjects to which the term *medical* would now exclusively refer; metaphysics were included. Into the merit of this as a work on practical medicine it would now be useless to inquire, and we may be content with ranking the merit of the author according to the estimation of the work during the seventeenth century, which was by no means inconsiderable. At the time when the last-mentioned work was published, motives which we cannot now discover induced Liddel to retire for the remainder of his life to his native country, which he had frequently visited during his honoured residence abroad. It would appear that he privately left the university, as Caselius remarks that the Duke of Brunswick, if aware of his intention, would probably not have permitted so active a teacher to leave his favourite institution, which was then falling into confusion. On his return he passed through Germany and Italy, and finally took up his residence in Scotland, although in what part of the country seems not to be known, the earliest information obtained as to his locality being of the year 1612, when he subscribed at Edinburgh a deed of settlement, mortifying certain lands in the neighbourhood of Aberdeen for the support of six bursars in Marischal College. The magistrates of Aberdeen were appointed trustees for the application of the fund; and, according to a not unusual practice, the curse of God was denounced against any one who should abuse or misapply it.¹ By a settlement dated the 9th December, 1613, he confirmed the previous donation, and left for the establishment of a professorship of mathematics in Marischal College, the sum of 6000 merks, which was afterwards profitably laid out on land by the trustees. To the same institution he left his books and instruments. This may be considered the last performance of his active life, for he died eight days after its date, on the 17th of December, 1613. He was buried in the church of St. Nicholas in Aberdeen, where a tablet of brass, on which his portrait has been boldly and expressively engraved by an artist at Antwerp, was erected to his memory. He is likewise commemorated by a small obelisk erected in the lands of Pitmedden, near Aberdeen—the same which he mortified for the support of bursars. Dying unmarried, the children of a brother and sister inherited his property, and one of the former succeeded Dr. William Johnston in the mathematical chair which Dr. Liddel had founded.

Besides the literary efforts already mentioned, a posthumous work by Liddel was published at Hamburg in 1628, entitled *Tractatus de Dente Aureo*; being an answer to a tractate by Jacobus Horstius, who had maintained the verity of a fable which bore that a boy of Silesia, who had lost a tooth, received from nature in return one of pure gold. The circumstance was considered an omen to encourage the

Germans in their wars with the Turks, and predictive of the downfall of the Mahometan faith. The subject can be interesting only to those who study the extent of human credulity.

LINDSAY, SIR DAVID, a celebrated Scottish poet of the sixteenth century, was born about the year 1490. He is distinguished by the title "of the Mount," from the name of his family seat near Cupar in Fife, and which is presumed, though not certainly known, to have been also the place of his birth. The early part of his education he received at Cupar, the after part of it at St. Andrews, to which he removed in 1505. Here he remained till 1509. From this period till 1512 there is a hiatus in his history, and it is not known how the intermediate space was employed. In that year, however, he is found to be in attendance upon the young prince, afterwards James V., who was born on the 10th of April, 1512. The particular nature of his appointment on first settling at court cannot be ascertained; but it does not appear to have been of a very dignified description. His attendance on the infant monarch seems also to have been divided with the royal parent James IV., on whom he is found waiting as a special servant on the remarkable occasion of the feigned spectre's appearance before that prince in the chapel of Linlithgow in 1513. Lindsay stood close beside the king during the whole of that extraordinary scene, and, according to his namesake the historian, declared that he, along with the other servants in attendance, made several ineffectual attempts to take hold of the ghostly intruder.

The death of James IV., which took place soon after, does not appear to have affected Lindsay's situation at court. He still continued his attendance on the young prince, and this in rather a singular capacity, considering the respectability of his family, although probably it may be thought that there was no degradation, if indeed it was not a positive honour, to take the personal charge of an infant king. This, however, he seems to have done literally, and, as is gathered from passages in his own works, much in the character of a dry nurse. The following are amongst those alluded to. The lines occur in the dedication of his poem entitled the *Dream*:—

"Quhen thou was young I bore thee in my arme,
Full tenderlie till thou begouth to gang;
And in thy bed aft happit thee full warne,
With lute in hand, sine sweetly to thee sang."

And again at an after period, when complaining of the neglect which he met with at court, he thus reminds the king of the days of his childhood, and of the playful and tender kindnesses which then passed between them:

"How as ane chapman beiris his pack,
I bure thy grace upon my back;
And sometimes strydlings on my neck,
Dansand with mony bend and beck.
The first syllabis that thou did muite
Was pa, da lyne, upon the lute;
Then playit I twenty springis perquier,
Quhilke was great pleasure for to heir;
Fra play thou let me never rest,
Bot Gynkertoun thou luift ay best."

Lindsay's attendance on the young king was not dignified by any charge whatever connected with his education. His services were entirely of a personal nature, and were only put in requisition when the royal youth returned from "scole." James' education was intrusted to Gavin Dunbar, an eminent and learned prelate, so that, with all Lindsay's genius, he seems not to have been thought competent to this important and honourable trust. That which he filled, however, such as it was, he retained till the

¹ In a minute of the council records of Aberdeen, of date 6th December, 1638, it is ordained that Dr. Liddel's bursars shall wear a black bonnet and a black gown, both in the college and in the street, conform to the will of the mortifier, under the pain of deprivation.

year 1524, when he was dismissed from it by the intrigues of the queen-mother, who, aiming at the sole direction of the national affairs during the minority of the king, carefully removed from the royal presence all whom she feared might exert an influence over the young monarch inimical to her own views and interests, and amongst that number she seems to have reckoned the poet. His dismissal, however, seems by no means to have taken place with the king's consent, although it is evident that he was obliged to submit to it. He was too young to assert his own will in opposition to that of his mother, but he did the next best thing he could for the kind companion of his tender years—he procured a pension to be bestowed upon him, and took especial care of its punctual payment.

On the king's assuming the reins of government in his own person, and when his will could be no longer opposed, Lindsay was recalled to court, and about 1530 was appointed Lyon king-at-arms, and as a necessary accompaniment, invested with the honour of knighthood. In the dedication of the *Dream* to the king, already quoted from, and which was written during the time of his banishment from court, although he complains of the treatment which he had received, he not only acquits the king of having any part in inflicting it, but speaks in terms of the warmest gratitude of the kindness of his royal master. He seems, indeed, to have formed a strong personal attachment to the monarch, and there is every reason to believe that it was reciprocal. Lindsay had now begun to make some figure as a poet. He had already written the *Dream* and the *Complaynt*, both productions of great merit; but it was to his talent for satire, a quality which he had not yet exhibited, that he was chiefly indebted for the singular degree of popularity which he afterwards acquired. Of the felicity and point with which he could exercise this dangerous gift, the following curious instance is related by Dr. Irving in his life of the poet:—"The king being one day surrounded by a numerous train of nobility and prelates, Lindsay approached him with due reverence, and began to prefer a humble petition that he would install him in an office which was then vacant. 'I have,' said he, 'servit your grace lang, and luik to be rewardit as others are, and now your maister taylor, at the pleasure of God, is departit, wherefore I wald desire of your grace to bestow this little benefite upon me.' The king replied, that he was amazed at such a request from a man who could neither shape nor sew. 'Sir,' rejoined the poet, 'that maks nae matter, for you have given bishoppricks and benefices to mony standing here about you, and yet they can nouthier teach nor preach, and why not I as weill be your taylor, though I can nouthier shape nor sew, seeing teaching and preaching are nae less requisite to their vocation than shaping and sewing to ane taylor?' The effect of this well-managed *jeu d'esprit* upon the bystanders, many of whom came within its range, may be readily conceived. Whatever might be their feelings on the subject, James himself enjoyed it greatly, and found much amusement in contemplating the angry looks which it occasioned."

This and other witticisms at the expense of the clergy are supposed by Lindsay's biographers to have been the principal cause of that want of promotion of which he so frequently complains; but this seems doubtful. James himself had but little reverence for the clergy, and it is not therefore likely that he would be displeased with Lindsay for entertaining similar sentiments. Of the king's opinion of the holy men of his time, his answer to a deputation of them which waited upon him with a list of Protestant

peers and chiefs whom they desired might be brought to punishment, is sufficiently indicative. "Pack, ye jugglers," said he, "get ye to your charges and reform your own lives; be not instruments of discord between my nobility and me; or I vow to God I shall reform you, not as the King of Denmark by imprisonment, nor as he of England by hanging and beheading, but yet by most severe punishments, if ever such motion proceed from you again." It is not therefore easy to say, considering the intimate, nay familiar, footing on which Lindsay stood with the king, what were the causes that afforded him grounds for his frequent complaints, if indeed he had any at all that were reasonable—a point by no means made evident. Whatever might be the emoluments arising from his services, they were now occasionally of a sufficiently dignified and important nature. In 1531 he was despatched on an embassy to Antwerp, to renew an ancient commercial treaty with the Netherlands; and in 1548 he was sent to the court of Denmark, to solicit ships to protect the Scottish coast against the English, and to negotiate a free trade in grain for the Scottish merchants.

Besides being a man of genius, Lindsay was also a man of great practical good sense, if the latter be not indeed a necessary attribute of the former, and this enabled him to see in a peculiarly strong and clear light the errors and absurdities, if not inherent in, at least which had been then ingrafted on, the Church of Rome, and against these he directed the whole force of his satirical powers, and with an effect which rendered him at once extremely formidable to the clergy, and singularly popular with the great bulk of the people.

Of his talent for ridicule the following exquisitely humorous specimen of his manner of dealing with the impositions of the Romish church will give a correct idea. It is the speech of a pardoner—of one who dealt in miracles and traded in holy relics and absolutions. It occurs in his play entitled *Ane Satyre of the Thrie Estaitis*:—

"My potent pardonis ye may se
Cum frae the Can of Tartarie,
Weill seillit with ester schellis,
Thocht ye haif no discretioun,
Ye sall haif full remission,
With help of buikis and bellis,
Heir is a rellik lang and braid,
Of Fynmackowll the richt chaft blade,
With teith and all togidder;
Of Collingis Kow heir is a borne,—
For eitting of Makameillis come
Was slane into Baquidder.
Heir is the cordis baith grit and lang
Quhilk hangit Johnnie Armistrang,
Of gude hempt saft and sound:
Gude haly pepill, I stand ford,
Quhaeir beis hangit in this cord,
Neidis never to be drowned.
The culum of St. Bryddis cow,
The grunt of Sanct Antonis sow,
Quhilk bure his haly bell;
Quha evir heiris this bell clink
Gife me a ducat to the drinke,
He sall never gang till hell—
Without he be with Belliall borne.
Maisteris, trew ye that this be scoome?
Cum, win this pardon, cum!
Quha luivis thair wyvis not with thair hairt
I haif power thame to depart;
Me think you deif and dum.
Hes nane of you curst wicket wyvis
That haldis you into sturt and stryvis?
Cum take my dispensatioun;
Of that cummer I sall mak you quy,
Howbeid yourself be in the wyte,
And mak ane fals narratioun.
Cum win the pardone, now let see
For meill, for malt, or for money;
For cok, hen, guse, or gryss.
Of rellikkis hur I haif a hunder,
Quhy cum ye not? This is a wonder;
I trow ye be not wyss."

From this it will be plainly seen what a dangerous and powerful enemy the Romish church had to contend with in the person of Lindsay—infinity more dangerous and more powerful than the ablest preacher or the most acute reasoner. The effect, indeed, aided as it was by the circumstance of the public mind being already attuned to such feelings and sentiments regarding religious matters, was altogether irresistible; and there is no doubt that this and similar productions of the satirist tended more to the accomplishment of the final overthrow of Popery in Scotland than any other circumstance previous to the Reformation. Lindsay himself was the Burns of his day. His poems were in every mouth, and were equally appreciated in the cottage as in the castle. Among the lower orders he was especially popular. His broad humour delighted them beyond measure, and there was scarcely one of them but could repeat large portions of *Davie Lindsay* from memory. Indeed it is not yet a very great while since his popularity among this class began to fade. Nor, though now certainly fast losing ground, is he by any means yet entirely forgotten in the country. Many an ancient tiller of the soil, and his equally ancient better half—for what remains of his fame is more vigorous in the country than the town—still cherish and appreciate the merits of their old favourite native poet.

The dread and detestation in which Lindsay's satirical poems were held by the clergy is expressively enough indicated by their having procured an act to have his "buick" burned during the regency of Mary of Lorraine, when they had regained a temporary ascendancy under that princess, and a wonder arises that Lindsay himself was not subjected to a similar fate; indeed, that he escaped it at all is a circumstance not easily accounted for.

During his lifetime many unfortunate persons were brought to the stake for heresy, and for contemning the ordinances of the existing religion; and how it happened that he, incomparably the most dangerous and most notorious offender of them all, should have escaped, is a question that may well be asked; but we suspect it is one which cannot be satisfactorily answered, otherwise than by supposing that he was protected by the strong arm of royalty.

In 1537 Lindsay acted as sort of master of ceremonies on the occasion of the arrival in Scotland of Mary of Guise, queen of James V. He contrived a variety of pageants, and prepared orations for the reception of her majesty at St. Andrews, and superintended in person the execution of his designs. Some of them were absurd and fantastic enough, but they were of course in accordance with the taste of the times.

Of the concluding years of his life nothing is known, nor is it ascertained when or where he died. Dr. Irving states that he survived till the year 1567; but how long he lived after is unknown. He must, however, from this account, have been at least upwards of seventy years of age at the time of his death. Lindsay's merits as a poet are not of the very highest order. Broad humour was his forte, and the specimen given will sufficiently show, that when he trusted to this talent he did not trust to a broken reed. His principal pieces are *The Dreame*, *The Complaynt*, *The Complaynt of the King's Papingo*, *Satyre on the Thrie Estaitis*, *Answer to the King's Flyting*, and *The Complaynt of Basche the King's Hound*.

LINDSAY, JOHN, eighteenth Earl of Crawford and fourth Earl of Lindsay, was born on the 4th of October, 1702. He was the eldest son of John, seventeenth Earl of Crawford, by Emilia, daughter of

James Lord Doune, and grand-daughter to the Duchess of Lauderdale. His mother having died while he was yet an infant, he was committed to the charge of an elderly female domestic at the family seat of Struthers in Fife; his father, who was at this time captain of the second troop of horse grenadiers, and lieutenant-general of Queen Anne's forces, residing constantly in London.

His lordship in after-life has been frequently heard to repeat an interesting anecdote which occurred about this period of his life. The Duke of Argyle and the Duke of Hamilton were one day dining with his father. After dinner a warm debate ensued about the then all-engrossing topic the union. In the midst of it the Duke of Argyle caught up the young earl, then a child, who was playing about the room, placed him on the table in the midst of the crowd of bottles and glasses by which it was occupied, and, after contemplating the boy for an instant, "Crawford," he said, addressing his father, "if this boy lives, I wonder whether he will be of your sentiments." "If he has a drop of my blood in his veins," replied the earl, "he certainly will." "I warrant, at any rate, he will make a brave fellow," said Argyle, kissing the child, and placing him again on the floor.

In 1713 his lordship succeeded, by the death of his father, to the family titles and estates, and was soon after invited, together with a younger and only brother and two sisters, by the Duchess of Argyle, their grand-aunt, to take up their residence with her in the Highlands, where she then lived in retirement. Here he remained until he had attained a proper age for college, when he was sent to the university of Glasgow. His biographer Rolt informs us, that while residing with the Duchess of Argyle, the young earl had fallen desperately in love with a little Highland girl; but he unfortunately gives no account of the progress or termination of this boyish attachment. The circumstance, however, affords an early indication of the warm, chivalrous, and romantic disposition for which his lordship was afterwards so much distinguished.

While at the university he rendered himself famous amongst his fellow-students by his boldness and courage. He led them on in all their battles with the citizens, headed every expedition of difficulty or danger, and stood forward on all occasions as the champion of the college, when any of its members were injured or insulted, or conceived themselves to be so. He, in short, took the whole burden of the university's honour on his own shoulders, and guarded and protected it with the most watchful zeal and uncompromising intrepidity. From the college of Glasgow he went to that of Edinburgh, where he remained for some time, and then returned to the retirement of the Duchess of Argyle in the Highlands. Here he now prosecuted his studies under the tuition of a private preceptor, and continued this course until he attained his nineteenth year.

On arriving at this age it was thought proper that he should, agreeably to the usual practice in the cases of young men of rank and fortune, proceed to the Continent, at once to complete his education, and to improve himself by travel. With this view he set out in the year 1721, first for London, where he remained for a short time, and thereafter to Paris. Here he entered the academy of Vaudeuil, and continued to attend that seminary during the two succeeding years. His progress in learning, and in the acquisition of every elegant accomplishment while he resided in the French capital, was so remarkable, as to excite a strong feeling of respect for his talents amongst his fellow-academicians, who saw him sur-

passing many students of much longer standing, and attaining an eminence which left him few competitors. In horsemanship, fencing, and dancing, he was considered, even in the refined city of Paris, to be without a rival.

In 1723 he quitted the academy of Vaudeuil, but continued to reside in France till 1726. In the same year in which his lordship left the seminary just named, an incident occurred strongly illustrative of his daring and determined character. Amongst the other sights exhibited during the festivities which were held in celebration of the accession of the young French king, was that of drawing one of the fish-ponds in the gardens of Versailles. The Earl of Crawford was amongst the crowd assembled to witness this novelty. In pressing forward to the edge of the water to obtain a sight of the young monarch, he was rudely jostled by a French marquis. Irritated by this incivility, the earl instantly caught up the Frenchman, who was in full court-dress, in his arms, and tossed him, robes and feathers and all, into the middle of the fish-pond. The spectators, highly delighted with the unexpected exhibition, burst into immoderate fits of laughter, in which they were cordially joined by the young king himself, who eagerly inquired who the person was that had thrown the marquis into the water. The latter himself did not think fit to take any notice of the affair either at the time or at any after period.

In 1726 his lordship returned to Britain, acknowledged by all to be one of the most accomplished gentlemen of the age. On the 25th of December of the same year he obtained a captain's commission in one of the additional troops of the 2d regiment of Royal Scots Greys. This appointment he held till 1730, when, these troops being disbanded, he again repaired to the Duchess of Argyle's residence in the Highlands, and remained there for the next eighteen months. In January, 1732, he once more left this retirement to mingle with the world, being appointed to the command of a troop of the 7th or Queen's Own regiment of dragoons. He was also, in the same month, elected one of the sixteen representatives of the Scottish peerage, in place of the Earl of Loudon deceased. This honour was again conferred upon him at the general elections in the years 1734, 1741, and 1747. In the month of June, 1733, his lordship was appointed gentleman of the bed-chamber to the Prince of Wales. On the 18th of February, in the year following, he obtained the captain-lieutenancy of the 1st regiment of foot-guards, and on the 1st of October, in the same year, a company of the 3d foot-guards. Notwithstanding these various appointments, the earl, who entertained from his youngest years a strong passion for military fame, finding his life but an inactive one, and the English service unlikely at the time to present him with any opportunity of distinguishing himself, sought and obtained the king's permission to go out as a volunteer to the Imperial army, the emperor being at that time engaged in a war with France.

His lordship joined the Imperialists in 1735, at Bruchsal on the Rhine, where he was received with every mark of distinction and favour by the celebrated Prince Eugene of Savoy, then in command of the troops in that quarter. Finding, however, that there was no immediate appearance of active service here, his lordship, accompanied by Viscount Primrose and Captain Dalrymple, both volunteers like himself, proceeded to the army under Count Sackendorff. The first duty imposed on them by this general was to reconnoitre the enemy, who were posted near Clausen. As they advanced towards the French lines they were met by a party of the enemy, three times

the number of their own escort, and a skirmish ensued, in which Count Nassau, who accompanied them, was killed, and Lord Primrose severely wounded by a musket-ball close beside the Earl of Crawford. On the evening of the same day, 17th of October, 1735, the battle of Clausen was fought, affording his lordship an opportunity of distinguishing himself, which he did not let pass. He attached himself to the Prince of Waldeck, who commanded the left wing of the Imperialists, and attended him throughout the whole of the battle. The position in which the earl was placed was the first attacked by the enemy, and was the most sanguinary part of the field. The intelligence, bravery, and good conduct of his lordship in this engagement excited the warmest admiration of the prince, and laid the foundation of his future fame as a soldier.

Preliminaries of peace between the emperor and France having been soon afterwards signed, the earl left the Imperial army, made a tour of the Netherlands and Holland, and again returned to Britain. On his arrival he was graciously received by George II., who honoured him with many warm expressions of esteem. His lordship remained at home for two years. At the end of this period he again became desirous of exchanging the monotony of a peaceful and idle for an active life, and sought the king's permission to serve as a volunteer in the Russian army, under Field-marshal Munich, then engaged with the Imperialists in a war against the Turks. Having obtained the royal permission, he embarked at Gravesend in April, 1738, for Petersburg. On his arrival there he waited upon the czarina, who appointed him to the command of a regiment of horse, with the rank of general in the Russian service. His lordship then left Petersburg in the middle of May to join the army, which he effected after a dangerous and tedious journey of a month's duration. Several sanguinary engagements with the Turks soon followed, and in all the earl eminently distinguished himself, both by his military skill and fearless intrepidity. In one of these murderous conflicts, which took place on the 26th of July, and in which the Turks and Tartars were repulsed with great loss, his lordship, who was at the head of a party of Cossacks, excited the astonishment and admiration of even these bold and skilful riders by his dexterity in horsemanship. Nor were they less delighted with the gallantry also which he exhibited in this battle, in the instance of a single combat with a Tartar, whom, after a desperate encounter, he sabred and stripped of his arms. The latter he afterwards brought to England with him as objects of curiosity.

The season being now far advanced, Marshal Munich thought it advisable to retire from the scene of operations, and accordingly retreated to Kiow, whither he was accompanied by the earl, who remained with him for three weeks after the cessation of hostilities. He then left Munich, and joined the Imperialists near Belgrade. The earl had now acquired a large stock of military knowledge, and had been especially improved in the art by his experience under Munich, whom he justly reckoned the first captain of the age. Six weeks after he joined the Imperial army, it was marched into winter-quarters. On this occasion he attached himself to Prince Eugene's regiment, and proceeded with that corps to Comorra, thirty-three miles S.E. of Presburg. Here, and at Vienna, to which he occasionally resorted, he remained till the middle of April, 1739. During this leisure his lordship employed himself in reducing to method and system the military knowledge which he had acquired, by drawing plans and writing observations on the

Russian campaign; thus availing himself of every means and opportunity that offered of improving himself in that art, to attain an eminence in which had been from his earliest years the object of his fondest hopes.

His lordship now joined the Imperialists assembled near Peterwaradin, under the command of Marshal Wallis, and attached himself to his old friend and fellow-soldier the Prince of Waldeck, lieutenant-general of infantry. In a short time after the battle of Krotzka, near Belgrade, was fought. In this engagement the earl, while fighting the Turks at the head of Palfi's cuirassiers, had his favourite black horse killed under him: another was immediately brought him, but he had scarcely gained the saddle when he himself was struck with a musket-ball, which, entering the outside of his left thigh, shattered the bone to pieces, and brought him to the ground. Here he lay for some time in a state of utter insensibility, when he was accidentally discovered by General Count Sucher, who, on perceiving him, ordered some grenadiers to raise him up and place him on one of his horses. This, however, was all the attention which the urgency of the moment would permit. Having been mounted on the horse he was left to his fate, and received no further assistance until the following morning, when he was found by one of his own grooms, his face deadly pale, his head uncovered, and himself holding fast by the horse's mane with both hands to prevent his falling off. He was now immediately carried to Belgrade, where surgical assistance was obtained. So desperate and severe was his wound, that his lordship walked for the first time, and even then with the assistance of crutches, only in the beginning of September, 1740—about a year and a half after he had received it.

Being advised to try the effects of the baths of Baden, he proceeded to that quarter, and remained there till the 11th of August, 1741; but finding there no effectual cure, he embarked for England. Notwithstanding his absence, the earl's interest had not been neglected at home. In July, 1739, he was made a colonel of horse and adjutant-general, and on the 25th October of the same year was appointed colonel of the 42d regiment of foot, or Royal Scots Highlanders. The same inclination to forward his military views marked his return. On the 25th of December, 1741, the year in which he came to England, he was appointed colonel of the second troop of horse grenadier-guards.

His lordship's wound still annoying him, he, in 1742, repaired to the baths of Bareges and Provence, from the last of which he derived great benefit. He finally joined the British army, of which Field-marshal Stair was commander, on the 24th of May, 1743, at Höchstet, where George II. happened to be at the time. At the battle of Dettingen, which took place on the 16th of the following month, the earl commanded a brigade of life-guards, and conducted himself throughout that conflict with a coolness and intrepidity which greatly enhanced his reputation for courage and military skill. During the action his lordship, on one occasion, ordered the officers of his brigade to the front, the enemy being within fifty paces of them. He then addressed his men, "Hark, my dear lads," he said, "trust to your swords, handle them well, and never mind your pistols." Placing himself then at their head, he led them on to the charge, the trumpets the while sounding the martial strain of "Britons, Strike Home;" his soldiers, participating in his enthusiasm, closed on the French, and drove them before them with prodigious slaughter. In the beginning of the battle a musket-ball struck his lordship's right holster-case, penetrated the leather, and,

hitting the barrel of the pistol which it contained, fell harmlessly into the case. Here it was found by his lordship, who showed it the day after the engagement to the king at Hanau, where he then was, and who, on seeing the earl approaching, exclaimed, "Here comes my champion;" following up afterwards this flattering expression of his opinion of his lordship's merits by the most gratifying remarks on the gallantry of his conduct on the preceding day.

In this year (1743) the earl was appointed colonel of the 4th or Scottish troop of horse-guards, and, after the battle of Dettingen, was made a general of brigade. In May, 1744, his lordship joined the combined armies, in camp near Brussels; but, owing to the over-caution of Marshal Wade, no opportunity offered of again distinguishing himself during the whole of the campaign which followed. In the next year, however, this was not wanting. The Duke of Cumberland, having been appointed captain-general of the British forces, arrived at Brussels on the 11th of April, 1745, his lordship being then with the army as brigadier-general. The arrival of his grace was soon after (30th April) followed by the battle of Fontenoy. In this engagement his lordship conducted himself with his usual gallantry, and exhibited even more than his usual skill, particularly in conducting the retreat, which he did in a manner so masterly, as procured for him a reputation for military genius not inferior to any of that age. His lordship also wrote an exceedingly able and interesting account of the battle. On the 30th of May following, he was promoted to the rank of major-general.

The rebellion in Scotland now occurring, his lordship was ordered, in February, 1746, from Antwerp, where he then was, to his native country, to take the command of the Hessians employed by the government on that occasion, and whose numbers amounted to 6000. With these troops he secured Stirling, Perth, and the passes into the Lowlands, while Cumberland proceeded by the north-east coast in quest of the rebels. On this visit to Scotland his lordship formed an acquaintance with, and afterwards married, Lady Jane Murray, eldest daughter and presumptive heiress of James, second Duke of Athole. On the extinction of the rebellion he returned to the army in the Netherlands, where he arrived early in June. At the battle of Rocoux, which took place on the 1st of October following, he commanded the second line of cavalry, with which he drove back the French infantry, and threw them into irretrievable confusion. His lordship soon afterwards accompanied the army into winter-quarters at Bois le Duc. His troop of horse-guards being this year disbanded, he was appointed to the command of the 25th regiment of foot on the 25th December, 1746.

In February following (1747) his lordship embarked for England, and at Belford met by appointment Lady Jane Murray, to whom he was married on the day of his arrival. His wound, which had never yet been thoroughly healed, now again broke out from fatigue, and subjected him anew to all the pain and suffering which he had experienced immediately after receiving it. From Belford the earl and countess proceeded to London, from thence to Helvoetsluis, and finally to Bois le Duc, where they arrived in June. On the 22d May his lordship, previous to his leaving England, was appointed to the command of the 2d regiment of dragoons or Royal Scots Greys, in room of the Earl of Stair deceased; and on the 26th of September following he was promoted to the rank of lieutenant-general.

On the conclusion of the campaign the earl, accompanied by his countess, went to Aix-la-Chapelle,

for the benefit of the baths there; being still seriously annoyed by his wound, which had again broken out after a second temporary cure. While his lordship was confined here to bed, his young countess—she had not yet attained her twentieth year—was seized with a violent and malignant fever, which carried her off in four days. His lordship, who was deeply affected by his loss, and for a time wholly inconsolable, ordered that the body of his deceased lady should be embalmed, and sent over to his family burial-place at Ceres in Fife. He himself remained at Aix till the opening of the campaign in 1748, when he joined the Duke of Cumberland and confederate army of 150,000 men. His lordship remained with the army till the conclusion of the peace, which took place in the same year. On the 16th of February of the following year (1749) he superintended the embarkation of the British troops at Williamstadt, and soon after returned to London, where he died on the 25th December, in the forty-eighth year of his age, after suffering again severely from his wound. His remains were carried to Ceres, and deposited beside those of his countess.

His lordship is represented to have been of middle size, remarkably stout, but finely formed. His manners were mild, elegant, and refined; his disposition generous, brave, and charitable, often beyond his means. His purse, open to all, was especially at the service of the distressed widows of officers, numbers of whom were relieved from misery and destitution by his bounty. His lordship always maintained a splendid retinue, and lived in a style becoming his rank, but was moderate at table, and temperate in all his habits. His judgment was strong, his temper serene and dispassionate. His lordship having died without issue, the titles of Crawford and Lindsay devolved on George, Viscount of Garnock.

LINDSAY, ROBERT, of Pitscottie, author of the *Chronicles of Scotland* known by his name, was born about the beginning of the sixteenth century. He was a cadet of the noble family of Lindsay, comprising the Earls of Crawford and Lindsay and the Lords Lindsay of Byres. He is not known otherwise than as the author of the *Chronicles* alluded to, and these have not had the effect of eliciting any information regarding him from his contemporaries, which could be of any avail to a modern biographer. He has in truth been scarcely recognized even as a literary man by the chroniclers of Scottish genius, and yet this is the only ground on which he seems to have any claim to commemoration, there being no other circumstance of any interest in his life but that of his having written the work spoken of above.

As to the *Chronicles* themselves, it is not perhaps very easy to determine in what language they should be spoken of. They present a strange compound of endless and aimless garrulity, simplicity, credulity, and graphic delineation; the latter, however, evidently the effect not of art or design, but of a total want of them. He describes events with all the circumstantiality of an eye-witness, and with all the prolixity of one who is determined to leave nothing untold, however trifling it may be. But his credulity in particular seems to have been boundless, and is remarkable even for the credulous age in which he lived. He appears to have believed without question everything which was told him; and, believing it, has carefully recorded it. After detailing at some length, and with great gravity, all the circumstances of the mysterious summons of Plotcock, previous to the battle of Flodden Field, "verily," he says, "the author of this that caused me write the manner of the summons was a landed gentleman, who was at

that time twenty years of age, and was in the town the time of the said summons; and thereafter, when the field was stricken, he swore to me, there was no man that escaped that was called in this summons, but that one man alone which made his protestation." The earnest and honest simplicity of the good old chronicler, however, is exceedingly amusing. He aims at nothing beyond a mere record of what he conceived to be facts, and these he goes on detailing with a great deal of incoherence, and all the unintellectual precision of an artificial process, neither feeling, passion, nor mind ever appearing to mingle in the slightest degree with his labours. These characteristics of the chronicles of Lindsay have greatly impaired their credibility, and have almost destroyed all confidence in them as authorities. Where he is corroborated by other historians, or by an association of well-known and well-established circumstances, he may be trusted; but where this is not the case, his testimony ought to be received with caution; for, where he does not absolutely create, he is almost sure to exaggerate, and is thus in any event a very unsafe guide.

If Lindsay was but an indifferent chronicler, he was a still worse poet, as will be conceded, it is presumed, after a perusal of the following introductory stanzas of a poetical address to Robert Stewart, Bishop of Caithness, prefixed to the *Chronicles*:—

"O little book, pass thou with diligence
To St. Andrews that fair city;
Salute that lord with humble reverence,
Beseeching him, of fatherly pity,
With entire heart, and perfect charity,
And that he would on noways offend
To look on thee, one day or two to spend.

"And there show him thy secrets, more and less,
From the beginning unto the end:
And also you to come utter and express;
Show him the verity, and make it to him kend—
The martial deeds, and also the fatal end,
Of his noble dainty progenitor,
In Scotland lived sometime in great honour."

The *Chronicles* begin with James II., 1436, and end with Queen Mary, 1565. This latter reign, however, is not completed, being carried down only a little beyond the period at which the marriage of that unfortunate princess with Darnley took place.

LISTON, ROBERT, F.R.S. This great medical teacher and practitioner was born on the 28th of October, 1794, and was son of the Rev. Henry Liston, minister of Ecclesmachan, Linlithgowshire. After having finished his course of classical and professional education, he, at the termination of the latter, practised as ordinary house-surgeon in the Royal Infirmary of Edinburgh. It speaks much for his professional attainments at this period—for he was only at the age of twenty-one—that he perceived the defects that prevailed in the management of that institution; and not a little for his courage as well as disinterestedness, that he set himself in earnest to reform them. Like most of those daring young geniuses, however, who look too exclusively to the good end in view, and are satisfied with the rectitude of their own motives, he pursued his plan of reform with such ardour as to waken the wrath of the directors, who were little disposed to be taught that they were in the wrong by such a juvenile instructor. Liston, however, persevered, while his growing reputation coming to his aid, at length gave his representations such weight, that, when his connection with the infirmary terminated, a full acknowledgment of the important services he had rendered was entered upon its records. In 1817 Mr. Liston became a graduate of the Royal Colleges of Surgeons of Edinburgh and London, and commenced practice in the

former city, where his reputation as a surgical operator grew yearly, until he attained that pre-eminence which left him without a rival. For this department, indeed, he was admirably fitted by nature; for independently of his acquired skill, he possessed a decision of will, firmness of nerve, strength of muscle, and quickness of eye, which qualified him for successful operations, where many of his gentler or less prompt and active brethren would have failed. But with all this, he was neither a rash experimenter nor merciless practitioner: on the contrary, he not only performed boldly and skilfully what was necessary, but stopped short where danger was to be apprehended. His manner also combined such gentleness with firmness, as secured the confidence and esteem of his patients. In addition to his practice, he delivered lectures, first on anatomy, and afterwards on surgery, between the years 1822 and 1834, which were highly valued and numerous attended.

Having thus won for himself a high reputation both as practitioner and instructor, it was natural that Mr. Liston should anticipate those professional honours which are so often bestowed upon candidates of greatly inferior pretensions. His hopes were directed to a professorship of surgery in the university of Edinburgh, which no one in Scotland was better (if as well) qualified to fill; but as the wished-for vacancy did not occur, or was won by a more favoured competitor, he formed a professorship for himself, with the world for his auditory, by publishing in 1833 his *Principles of Surgery*, a work which he afterwards repeatedly revised, and which went through several editions. Subsequently many of his lectures on various subjects, and especially on lithotomy, were published in the *Lancet*. Of the merits of these writings, which were recognized at once by the whole medical profession, and which have spread his fame through every medical school in Europe and America, it would now be superfluous to speak; their scientific correctness and thorough practical character, as well as the improvements which they have introduced into practical surgery, are sufficient evidences of their worth. Disappointed in his hopes of Edinburgh, and having fully tested his own powers, Dr. Liston was now desirous of a wider field, which was opened to him in 1834, by his being appointed surgeon to the North London Hospital. He left the Scottish capital in the November of that year; and so fully was his value now appreciated in Edinburgh, that before his departure a public dinner was given to him, at which the lord-provost presided, while the addresses delivered on the occasion by the most eminent of the medical and surgical professions, who attended, made eloquent acknowledgment of his high talents and eminent services, as well as regret at their transference to another sphere of action.

In London the fame of Dr. Liston became so distinguished, that his private practice annually increased, and the most difficult and critical operations were reserved for his experienced hand. After having filled for some time the office of surgeon to the North London Hospital, he was appointed professor of clinical surgery in University College; and in 1846, in addition to that situation, which he raised to honour and distinction, he was appointed one of the examiners of the Royal College of Surgeons. In this way, notwithstanding a certain bluntness of manner which he had preserved from the beginning, his private worth, as well as professional knowledge, procured him not only the highest distinction in his own country, but a world-wide reputation, which as yet has suffered no abatement. Here, however, his career was unexpectedly closed when it was at the brightest. After enjoying almost uninterrupted good

health till within a year of his death, he was attacked by a malady, the causes of which his medical advisers could not ascertain, but which was found, on a *post mortem* examination, to have been occasioned by aneurism in the aorta. He died in Clifford Street, London, on the 7th of December, 1847, at the age of fifty-three.

LITHGOW, WILLIAM, a well-known traveller of the seventeenth century, was born in the parish of Lanark in the year 1583. Nothing is known of his birth or parentage, or of the earlier period of his life. He seems to have attracted very little general notice prior to the publication of his travels in 1614; and even, the celebrity which these acquired for him does not appear to have suggested any inquiry into his previous history.

There is no reason, however, to believe otherwise than that he was a person of rather mean condition and poor circumstances, though evidently possessed of an education very far surpassing what was common among the vulgar at the period when he lived. The motives which induced him to leave his native country to perform a painful and dangerous pilgrimage through foreign lands, are not more obvious than some of the other particulars of his early life. He himself, in the strange and almost unintelligible jargon in which he frequently indulges in the work which records his adventures, obscurely assigns two: the oppression of enemies—but who they were, or what was the cause of their enmity, he does not say—and an irresistible desire to visit strange lands. It would indeed appear that this last was the ruling passion of his life, and that, together with a roving, unsettled, and restless disposition, it was the principal agent in compelling him to undertake the formidable journeys which he accomplished, and enabled him to bear up with such a series of hardships and bodily sufferings as perhaps no man ever before or since has endured.

From the obscurity in which his early life is involved, it is not therefore until he has assumed the character which has procured him celebrity, namely, that of a traveller, that Lithgow is introduced to us.

In his youth, while he was, as he himself says, yet a stripling, he made two voyages to the "Orcadian and Zetlandian Isles." Shortly after this he proceeded on a tour through Germany, Bohemia, Helvetia, and the Low Countries. From the latter he went to Paris, where he remained for ten months. William Lithgow nowhere gives the slightest hint regarding the source whence he derived the funds necessary to defray the expenses of these journeys; but there seems to be some reason for believing that he trusted in a great measure to chance, and to the casual assistance which he might receive from any of his countrymen whom he might encounter in the different places he visited. This applies only, however, to the first part of his career; the latter was provided for by a piece of good fortune which shall be noticed in its proper place.

On the 9th of March, 1609, Lithgow again started from Paris on another roving expedition, and on this occasion proceeded in the first instance directly to Rome. He was escorted several miles on his way by three or four of his countrymen, with whom he had picked up an acquaintance while in Paris, and who, not improbably, supported him during the time of his residence in that city. These persons he describes as gentlemen, and one of them, at any rate, certainly had a claim to this character on the score of rank. This was Hay of Smithfield, Esq., of the King of France's body-guard. Although thus associating himself, however, with these gentlemen,

Lithgow does not speak of them as equals, but in a marked tone of inferiority; leaving altogether an impression that their kindness and attention proceeded from the circumstances of his being a countryman, a man of talent, and of a singular, bold, and adventurous disposition. Having bid adieu to his companions, he trudged onwards to Rome on foot; for such was his usual mode of travelling. He made it a rule, and strictly adhered to it, never to avail himself of any conveyance during a journey when he could accomplish it on foot, and his only deviation was in the cases of crossing seas, rivers, or lakes. During all his travels he never mounted a horse, or put his foot into a carriage, or any description of vehicle whatever.

While in Rome he made a narrow escape from the Inquisition; the most sanguinary and ferocious of whose members were at that time, singular to say, Scotsmen. Two of these were from St. Andrews. There were besides one of the name of Gordon, one Cunningham, born in the Canongate of Edinburgh, and several others; and it was from the eager pursuit of these, his own countrymen, that poor Lithgow found the greatest difficulty in escaping. This, however, he effected by the assistance of a domestic of the Earl of Tyrone, who was then residing at Rome. This man, whose name was Megget, concealed him for three days and nights on the roof of the earl's palace, and on the fourth night conveyed him secretly out of the city, by aiding him to scale the walls, as the gates and streets were all carefully guarded by persons appointed by the Inquisition to apprehend him.

From Rome Lithgow proceeded to Naples, and from thence to Loretto. On his way to the latter place he overtook a carriage in which were two young gentlemen from Rome with their mistresses, all proceeding joyously on a pilgrimage to the shrine of the Madonna. This lively group insisted upon the lonely pedestrian's stepping into their carriage. but adhering to the rule he had laid down of never availing himself of any such conveyance, he obstinately refused. Finding that they could not prevail upon him to take a seat beside them, the good-natured pilgrims descended from their carriage and insisted on keeping him company on foot, and thus associated the whole party jogged merrily on for Loretto. Here he fell in with another of his countrymen, of the name of Arthur, with whom he had been formerly acquainted, and who seems to have been imbued with some portion of his own restless and rambling disposition. Having spent some time in Loretto they proceeded together to Ancona, and thence by sea to Venice. Here his companion left him to cross the Alps, while his own "purpose reached for Greece and Asia." Arthur, it appears, had been a domestic servant of the Earl of Glencairn. The circumstance therefore of Lithgow's making him a companion, would seem to be an additional proof that he did not assume, or pretend to, the character of a gentleman traveller.

Lithgow now proceeded to visit the various islands in the Mediterranean, and thereafter wandered through Greece and Asia, encountering innumerable dangers and difficulties; now shipwrecked, now attacked by banditti, now plundered and maltreated, and with all this, frequently exposed for days and nights together to the inclemency of the weather; his religion excluding him in several places, not only from the hospitality of the natives, but even from the shelter of their houses. During his peregrinations through Greece, he met with two gentlemen from Venice who entertained him kindly for ten days, and on his departure made him a present of fifty zechins

in gold; the first gift, he says, he received in all his travels, and, it may be added, that this is also the first allusion he makes to any pecuniary matters relating to himself. He now proceeds to declare, that if some such instances of good fortune had not befallen him he should never have been able to accomplish his "sumptuous peregrination."

Not contented with the adventures in which he was unavoidably, on his part, involved, there were others which he sought. Like another Don Quixote, he released captives, or at least assisted them to effect their escape, and came to the aid of distressed damsels. Altogether he appears to have been a singularly benevolent and kind-hearted man; ready at all times to peril his life for the injured or oppressed, whenever he thought such a risk could be of service to them.

From Greece Lithgow proceeded overland to Egypt, and finally reached Grand Cairo. During his journey thither he had the good fortune to fall in with three Dutchmen at Jerusalem, who were journeying with a caravan in the same direction. These he joined, and kept by them until they reached the Egyptian capital. Here his three companions speedily killed themselves by drinking "strong Cyprus wine without mixture of water." Each as they died left the survivors all his property, and the last bequeathed the whole accumulated amount to Lithgow. He had, however, some difficulty in rescuing his legacy from the grasp of the Venetian consul; but by sacrificing a part he obtained possession of the remainder, which amounted to 942 zechins of gold, besides rings and tablets. Thanking God for his good fortune, he now proceeded, quite at his ease as to money matters, to inspect everything that was curious in the city. From Cairo he proceeded to Alexandria, where he embarked for Malta. From thence he sailed for Sicily, walked afterwards to Paris, and finally came over to England, where he presented to King James, to Queen Anne, and to Prince Charles, "certain rare gifts and notable relics brought from Jordan and Jerusalem."

After remaining in London for about a year, Lithgow's propensity to roving again became too strong to be resisted, and he set out upon a second expedition. He now traversed the Netherlands and Switzerland, and from thence proceeded to Calabria. Here another windfall came in his way, but it was one of a much more questionable nature in point of morality than that which met him at Cairo. Between Saramutza and Castello Franco he found the dead bodies of two young barons lying in a field, who had just killed each other in a duel. Seeing that they were richly clad, Lithgow, "to speak the truth," as he himself says, searched their pockets, and found two silken purses well filled with Spanish pistoles. These, together with certain rings which they wore on their fingers, he carried off and appropriated to his own use; and he thus moralizes on the fact:—"Well, in the mutability of time there is ay some fortune falleth by accident, whether lawful or not I will not question. It was now mine that was last theirs; and to save the thing that was not lost I travelled that day thirty miles further to Terra Nova."

Lithgow now visited Africa, traversing Barbary, Morocco, Algiers, Tunis, and Tripoli. Then crossing over to Italy, he perambulated Hungary, Germany, and Poland, and finally reached Dantzic, where he embarked for England, and once more arrived in safety in London. He was now an object of curiosity and interest, and while he remained in England was frequently admitted to familiar audiences of his majesty, and was at all times a welcome guest at the

tables of the first nobility and gentlemen in the kingdom, where he repaid their civilities by relating the story of his adventures.

Lithgow's spirit of enterprise and singular restlessness of disposition, however, were still unsubdued; and neither all that he had seen, nor all that he had suffered, could induce him to settle at home. In 1619 he again set out on another roving expedition, but on this occasion he was furnished with letters of recommendation from King James, addressed to "all kings, princes, and dukes." Provided with these documents he proceeded to Ireland. From thence he sailed for France, travelled through Portugal and Spain, and finally arrived at Malaga. Here he was apprehended as a spy, and accused of giving intelligence to some English ships which were then on the Spanish coast, respecting the return of the Plate fleet. All poor Lithgow's proofs and asseverations of innocence availed him nothing. He was subjected to the most dreadful tortures. His limbs were mangled and crushed, and his body torn and lacerated with tightened cords and other engines of torture. His innocence as a spy was ultimately established to the satisfaction even of his persecutors; but he was then handed over to the Inquisition, which inflicted upon him a fresh series of tortures not less horrible than the first. Maimed and mutilated, Lithgow was at length liberated by the interference of the English consul and of several English residents in Malaga, from whom all knowledge of the unfortunate traveller's fate had been carefully concealed until it was discovered to them by accident.

Shortly after his release he was carried on board of an English ship, for his person was so fearfully mangled that he was not only wholly unable to walk, but was apparently beyond hope of recovery. In this state, on his arrival in England, which was in 1621, he was exhibited, lying on a feather bed, to the king and the whole of the court, all the persons of whom it was composed crowding to see him. His miserable situation excited universal sympathy, and might under a more spirited prince have become the ground of a national quarrel with the country in which the cruelty and injustice had been inflicted. If his majesty, however, failed in avenging the unhappy traveller's injuries, he was not wanting in compassion for his sufferings. He was twice sent to Bath at the royal expense, and maintained by the same hand for seven and twenty weeks, until he had in a great measure recovered his original health and strength, "although," he says, "my left arm and crushed bones be incurable."

Soon after his arrival in England, Lithgow was carried, by the king's direction, to the residence of Gondomar, the Spanish ambassador at the English court, for the purpose of endeavouring to procure some redress of his grievances. By this celebrated person he was treated with characteristic duplicity. Lithgow finding the case hopeless, accused the Spaniard, in the presence chamber, and before a crowd of courtiers, of deceit and ungentlemanlike conduct. This charge he followed up with an act of violence on the person of the ambassador, for which, though his spirited conduct was much applauded, he was sent to the Marshalsea, where he was confined nine weeks. Lithgow after this made several attempts to procure some sort of redress or compensation from the House of Commons, by a bill of grievances, but none of these were successful. The last effort of this kind which he made was in 1626. In the year following he returned to Scotland; and still under the influence of that spirit which had urged him to roam through the world for so many years, he undertook a tour through the

Western Isles. He speaks of himself as having been in the island of Arran in the year 1628; but from this period little more is known regarding him. He finally, however, and probably soon after this, returned to his native parish, where he remained till his death; but when this took place is uncertain. He was interred in the churchyard of Lanark, and is yet familiarly spoken of in that part of the country, where it is said several of his descendants still exist. The place of his sepulture is unmarked by any memorial, and cannot therefore be pointed out.

The first edition of his travels was printed in 1614, 4to. This work was again reprinted in the reign of Charles I., with a dedication to that monarch. He also published an account of the siege of Buda in 1637, a circumstance which shows that he had attained a considerable age; as in 1637 he would be in his fifty-fourth year.

LIVINGSTON, JOHN, one of the most revered names in Scottish ecclesiastical history. He was born at Kilsyth in Stirlingshire (then called Monybroch), on the 21st of June, 1603. His father, Mr. William Livingston, who officiated as minister of Monybroch from 1600 to 1614, and was then translated to Lanark, was the son of Mr. Alexander Livingston, his predecessor in the charge of the parish of Monybroch, and who, in his turn, was a grandson of Alexander, fifth Lord Livingston, one of the nobles intrusted with the keeping of Queen Mary in her infancy, and the ancestor of the Earls of Linlithgow and Callander. His mother was Agnes Livingston, daughter of Alexander Livingston, a cadet of the house of Dunnipace. His Christian name he received at baptism in compliance with the request of Lady Lillias Graham.¹

"Worthy famous Mr. John Livingston," as he was fondly termed by his contemporaries, received the rudiments of learning at home, and at the age of ten was sent to study the classics under Mr. Wallace, a respectable teacher at Stirling. During the first year he made little progress, and was rather harshly treated by the schoolmaster; this was corrected by a remonstrance from his father, after which he profited very rapidly by his studies. When he had completed his third year at Stirling, it was proposed that he should go to the Glasgow university; but his father eventually determined that he should remain another year at school, and this, he informs us,² was the most profitable year he had at school, being chiefly devoted to a course of classical reading. During the time of his residence in Stirling, Mr. Patrick Simpson, a clergyman of much note, officiated in the parish church; and Mr. Livingston relates that, on receiving the communion from his hands, he experienced a physical agitation of an uncommon character, which he believed to have been occasioned "by the Lord for the first time working upon his heart." At his father's house in Lanark, to which he returned in 1617, in order to attend the death-bed of his mother, he had further opportunities of profiting religiously; for it was the occasional resort of some of the most distinguished clergymen and "professors" of that age. The celebrated Mr. Robert Bruce was among the number of the former; and of the latter were the Countess of Wigton (whom Livingston himself calls the "rare"), Lady Lillias Graham, already mentioned, Lady Culross, still more famous than any of the rest, and Lady Barnton. It

¹ A gentlewoman of the house of Wigton, with whom, as with many persons of equal rank, his father was on intimate terms of personal and religious friendship, and whose father, husband, and eldest son, were all of the same appellation.

² In his life, written by himself. Glasgow, 1754.

seems to have then been a common practice for such persons as were conspicuous for religious earnestness, of whatever rank, to resort much to each other's houses, and to take every opportunity, when on a journey, to spend a night in a kindred domestic circle, where they might, in addition to common hospitalities, enjoy the fellowship of a common faith. To a large mingling in society of this kind we are no doubt to attribute much of the sanctity for which Mr. Livingston was remarkable through life.

The subject of our memoir received his academical education at the university of St. Andrews, where Mr. Robert Boyd was then principal, and Mr. Robert Blair, another eminent divine, the professor of theology. Being tempted at this time by some proposals for a secular profession, he adopted the expedient of retiring to a cave on the banks of Mouse-water (perhaps the same which sheltered Wallace), where he spent a whole day in spiritual meditation, and ultimately resolved to become a preacher of the gospel, as the only means of securing his own eternal interests. During the progress of his subsequent studies in divinity, he gave token of that firm adherence to Presbyterian rules which characterized him in his maturer years. He was sitting with some of the people and a few of his fellow-students in a church in Glasgow, when the archbishop (Law) came to celebrate the communion for the first time after the Episcopal fashion established by the Perth Articles. Seeing the people all sitting as usual, Law desired them to kneel, which some did, but among the recusants were Livingston and the little party of students. The archbishop commanded them either to kneel or depart: to this Livingston boldly replied, that "there was no warrant for kneeling, and, for want of it, no one ought to be excommunicated." Law only caused those near them to move in order that they might remove.

Mr. Livingston became a preacher in 1625, and for a considerable time preached for his father at Lanark, or in the neighbouring parish churches. He had several calls to vacant churches, especially to Anwoth in Galloway, which was afterwards filled by the celebrated Rutherford. The increasing rigour of the Episcopal regulations appears to have prevented him from obtaining a settlement. He was at length, in 1627, taken into the house of the Earl of Wigton at Cumbernauld, as chaplain, with permission to preach in the hall to such strangers as chose to accompany the family in their devotions, and also to minister occasionally in the neighbouring pulpits. He was living in this manner when he produced the celebrated revival of religion at the Kirk of Shotts. This, it seems, was a place where he always found himself in the enjoyment of an unusual degree of "liberty" in preaching. On Sunday, June 20, 1630, the communion was celebrated at Shotts to a large assemblage of people, among whom were all the more eminently pious women of rank in that part of the country. The impression produced by the solemnities of the day was so very great that many did not depart, but spent the whole night in prayer and conference.¹ Among these was Mr. Livingston, who being requested to give a sermon next morning to the still lingering multitude, walked forth very early into the fields. Here, he says, "there came such a misgiving of spirit upon me, considering my unworthiness and weakness, and the multitude and expectation of the people, that I was consulting with myself to have stolen away somewhere." He had actually gone to some distance, and

was losing sight of the Kirk of Shotts, when the words, "Was I ever a barren wilderness or a land of darkness?" were brought into his heart with such an overcoming power as constrained him to return. In the ensuing service he "got good assistance about an hour and a half" upon the text, Eze. xxxvi. 25, 26: "Then will I sprinkle clean water upon you," &c. "In the end," says Mr. Livingston, "offering to close with some words of exhortation, I was led on about an hour's time in a strain of exhortation and warning, with such liberty and melting of heart, as I never had the like in public all my lifetime." The effect of the address is spoken of by Fleming, in his *Fulfilling of the Scriptures*, as "an extraordinary appearance of God and down-pouring of the Spirit, with a strange unusual motion on the hearers," inasmuch that five hundred, it was calculated, had at that time "a discernible change wrought upon them, of whom most proved lively Christians afterwards." It was the sowing of a seed through Clydesdale, so as many of the most eminent Christians in that country could date either their conversion, or some remarkable confirmation of their case, from that day." The importance of such a sermon in propagating religion in a country where it was as yet but imperfectly introduced, has given this event a prominent place—not perhaps in the history of the *Church of Scotland*, but certainly in the history of the *gospel*. It caused Monday sermons after the celebration of the communion to become general, and appears to have been the origin of that now habitual practice.

Livingston gives some curious particulars in reference to this signally successful preaching. He officiated on the ensuing Thursday at Kilmarnock, and there he was favoured with some remains, as it were, of the afflatus which had inspired him on the former day. Next Monday, however, preaching in Irvine, "I was so deserted," says he, "that the points I had meditated and written, and had fully in my memory, I was not, for my heart, able to get them pronounced. So it pleased the Lord to counterbalance his dealings and hide pride from man. This so discouraged me that I was upon resolution for some time not to preach—at least not in Irvine; but Mr. David Dickson could not suffer me to go from thence till I preached the next Sabbath, to get, as he expressed it, amends of the devil. And so I stayed, and preached with some tolerable freedom."

Finding all prospect of a parochial settlement in his native country precluded by the bishops, Mr. Livingston was induced in August, 1630, to accept the charge of the parish of Killinchie, in the north of Ireland, where a considerable portion of the population consisted of Scots. Here he ministered with great success, inasmuch that by one sermon preached in the neighbouring parish of Holywood, he was calculated to have converted a thousand persons in as effectual a manner as he had done the five hundred at Shotts. Such extensive utility is perhaps only to be expected in a country such as Scotland and Ireland then were, and as America has more recently been; but yet, as similar acts are recorded of no contemporary clergyman whose name is familiar to us, we must necessarily conclude that there was something in the oratorical talents and spiritual gifts of Mr. Livingston which marked him out as a most extraordinary man. His success as a minister is less agreeably proved in another way—by the persecution, namely, of the bishop in whose diocese he officiated. After being once suspended and replaced, he was, in May, 1632, deposed, along with Messrs. Blair, Welsh, and Dunbar; after which he could only hold private meetings with his flock. He and several of his people were now become so desperate

¹ The bed-room of Lady Culross was filled with people, to whom she prayed "three large hours' time,"—"having great motion upon her."—*Livingston's Life*, *MS. Ad. Lib.*

as to the enjoyment of religion in their own way, under British institutions, that they formed a resolution to emigrate to America. He accordingly set sail from Weymouth; but being driven back by a contrary wind, some circumstances induced him to change his mind. Almost immediately after his return he and his deposed brethren were reinstated by a letter of the lord-deputy Strafford; and, for a year and a half, he continued to preach at Killinchie.

Mr. Livingston's salary in this charge was only £4 a-year; yet he takes pains to assure us, that notwithstanding all his travels from place to place, and also occasional visits to Scotland, he never wanted money. He lets slip afterwards, however, that he received sums occasionally from the Countesses of Eglintoun and Wigton, and other devout ladies. His mode of life was so fully justified by the circumstances of the times, which rendered it by no means singular, that Mr. Livingston was not deterred from forming a matrimonial connection. He had formed an attachment to the eldest daughter of Bartholomew Fleming, merchant in Edinburgh, "of most worthy memory." The young lady was also recommended to him by the favourable speeches of many of his friends. Yet—and the fact is a curious trait of the age and of the man—he spent nine months "in seeking directions from God," before he could make up his mind to pay his addresses. "It is like," he says, "I might have been longer in that darkness, except the Lord had presented me an occasion of our conferring together; for, in November, 1634, when I was going to the Friday meeting at Antrim [the lady was then residing on a visit in Ireland], I forgathered with her and some others going thither, and propounded to them, by the way, to confer upon a text whereon I was to preach the day after at Antrim; wherein I found her conference so just and spiritual, that I took that for some answer to my prayer to have my mind cleared, and blamed myself that I had not before taken occasion to confer with her. Four or five days after, I proposed the matter, and desired her to think upon it; and after a week or two I went to her mother's house, and, being alone with her, desiring her answer, I went to prayer and desired her to pray, which at last she did: and in that time I got abundant clearness that it was the Lord's mind that I should marry her, and then propounded the matter more fully to her mother; and, albeit I was then fully cleared, I may truly say it was about a month after before I got marriage affection to her, although she was, for personal endowments, beyond many of her equals, and I got it not till I obtained it by prayer; but thereafter I had greater difficulty to moderate it."

The parties, having proceeded to Edinburgh, were married in the West Church there, June 23, 1635, under circumstances of proper solemnity, notwithstanding that Archbishop Spottiswood, chancellor of Scotland, was understood to have issued orders for the apprehension of Mr. Livingston some days before. The wedding was attended by the Earl of Wigton and his son Lord Fleming, and a number of other pious friends. Having returned to Ireland, he was in the ensuing November once more deposed, and even, it appears, excommunicated. He continued, nevertheless, to hold forth at private meetings in his own house, where Blair, also again deposed, took up his abode. At length, in renewed despair, he once more embarked along with his wife for the American colonies; but, strange to say, after having sailed to a point nearer to the banks of Newfoundland than to any part of Europe, he was again driven back; after which, conceiving it "to be the

Lord's will that he should not go to New England," he made no further attempt.

For about two years Mr. Livingston preached occasionally, but always in a somewhat furtive manner, both in Ireland and Scotland. He was in the latter country in 1637, when at length the bishops brought matters to such a crisis, as terminated their supremacy in Scotland, and enabled divines like Mr. Livingston to open their mouths without fear. Mr. Livingston was present at Lanark when the covenant was received by the congregation of that place; and he says that, excepting at the Kirk of Shotts, he never saw such motions from the Spirit of God; "a thousand persons all at once lifting up their hands, and the tears falling down from their eyes." Being commissioned to proceed to London, to confer with the friends of the cause in reference to this grand national movement, he disguised himself in a gray coat and a gray montero cap, for the purpose of avoiding the notice of the English authorities. An accident which befell him on the way confined him, after his arrival in the metropolis, to his chamber; but he was there visited by many friends of liberty in church and state, including several of the English nobility. He had not been long in London when the Marquis of Hamilton informed him through a mutual friend that the king was aware of his coming, and threatened "to put a pair of fetters about his feet." He was therefore obliged to retire precipitately to his own country.

In July, 1638, Mr. Livingston was enabled, under the new system of things, to enter upon the ministry of the parish of Stranraer in Wigtonshire—a place with which he had long been familiar, in consequence of his frequently passing that way to and from Ireland. Here his zeal and eloquence appear to have been deeply appreciated, inasmuch that the people flocked even to hear his private family devotions, filling his house to such a degree, that he had at length to perform these exercises in the church. It is a still more striking proof of his gifts, that multitudes of his Irish friends used to come over twice a-year to be present at his ministrations of the communion. On one occasion he had no fewer than 500 of these far-travelled strangers; on another he had twenty-eight of their children to baptize! Such was then the keen appreciation of "free preaching," and the difficulty of obtaining it under the restrictions of the Episcopal system, that some of these people were induced to remove to Stranraer, simply that they might be of the congregation of Mr. Livingston. It is confessed, indeed, by the subject of our memoir, that the obstructions which the Irish Presbyterians encountered at that time in hearing the gospel preached after their own way tended materially to excite and keep alive religious impressions in their hearts. "The perpetual fear," he says, "that the bishops would put away their ministers, made them with great hunger wait on the ordinances." The narrow views of that age prevented the king or his ecclesiastical friends from seeing the tendency of their measures; but the result was exactly accordant to the more extended philosophy of our own times. We have now less persecution, and naturally a great deal more indifference.

It is a fact of too great importance to be overlooked, that Mr. Livingston was a member of the General Assembly which met at Glasgow in November, 1638, and decreed the abolition of Episcopacy in Scotland. He accompanied the army in the campaign of 1640 as chaplain to the regiment of the Earl of Cassillis, and was present at the battle of Newburn, of which he composed a narrative. In November he returned to Stranraer, where, in one

Sunday, notwithstanding the smallness and poverty of the town, he raised a contribution of no less than forty-five pounds sterling for the use of the army. A large portion of this, it must be remarked, was given by one poor woman under very peculiar circumstances. She had laid aside, as a portion to her daughter, seven twenty-two shilling pieces and an eleven-pound piece: the Lord, she said, had lately taken her daughter, and having resolved to give him her portion also, she now brought forward her little hoard in aid of that cause which she seriously believed to be his. In these traits of humble and devoted piety there is something truly affecting; and even those who are themselves least disposed to such a train of mind must *feel* that they are so.

Mr. Livingston appears to have always retained a warm feeling towards the Presbyterians of the north of Ireland. At the breaking out of the rebellion in 1641, when these poor people fled in a body from the fury of the Catholics, multitudes came into Scotland by the way of Stranraer. Of the money raised in Scotland to relieve the refugees, £1000 Scots was sent to Mr. Livingston, who distributed it in small sums, rarely exceeding half-a-crown, to the most necessitous. He complains in his memoirs, that out of all the afflicted multitudes who came in his way, he hardly observed one person "sufficiently sensible of the Lord's hand" in their late calamity, or of their own deserving of it, "so far had the stroke seized their spirits as well as bodies." This is a remark highly characteristic of the age. One more valuable occurs afterwards. Being sent over to Ireland with the Scottish army, "he found," he says, "a great alteration in the country; many of those who had been civil before were become many ways exceeding loose; yea, sundry who, as could be conceived, had true grace, were declined much in tenderness; so, as it would seem, *the sword opens a gap, and makes everybody worse than before*, an inward plague coming with the outward; yet some few were in a very lively condition." If Mr. Livingston had not been accustomed to regard everything in a spiritual light, he would have argued upon both matters with a view simply to physical causes. He would have traced the savage conduct of the Catholic Irish to the united operation of a false religion and the inhumane dominancy of a race of conquerors; and the declining piety of the Presbyterians to that mental stupor which an unwonted accumulation of privations, oppressions, and dangers can hardly fail to produce. It is strange to a modern mind to see men, in the first place, violating the most familiar and necessary laws respecting their duty to their neighbours (as the English may be said to have done in reference to the native Irish), and then to hear the natural consequences of such proceedings described as a manifestation of divine wrath towards a class of people who were totally unconnected with the cause.

Mr. Livingston was minister of Stranraer for ten years, during which time he had not only brought his own flock into a state of high religious culture, but done much latterly to restore the former state of feeling in the north of Ireland. In the summer of 1648 he was translated by the General Assembly to Ancrum in Roxburghshire, where he found a people much more in need of his services than at Stranraer. In 1650 he was one of three clergymen deputed by the church to accompany an embassy which was sent to treat with Charles II. at the Hague for his restoration to a limited authority in Scotland. In his memoirs Mr. Livingston gives a minute account of the negotiations with the young king, which throws considerable light on that transaction, but cannot here be entered upon. He seems to be convinced,

however, of the insincerity of the king, though his facility of disposition rendered him an unfit person to oppose the conclusion of the treaty. Being of opinion that the lay-ambassadors were taking the *curse of Scotland* with them, he refused to embark, and was at last brought off by stratagem. In the ensuing transactions, as may be conceived, he took the side of the protestors; but, upon the whole, he mingled less in public business than many divines of inferior note in spiritual gifts. During the protectorate he lived very quietly in the exercise of his parochial duties; and on one occasion, though inclined to go once more to Ireland, refused a charge which was offered to him at Dublin, with a salary of £200 a year. After the Restoration he very soon fell under the displeasure of the government, and, in April, 1663, was banished from his native country, which he never more saw. He took up his residence at Rotterdam, where there was already a little society of clergymen in his own circumstances.

In narrating the events of this part of his life Mr. Livingston mentions some curious traits of his own character and circumstances. "My inclination and disposition," he says, "was generally soft, amorous, averse from debates, rather given to laziness than rashness, and easy to be wrought upon. I cannot say what Luther affirmed of himself concerning covetousness; but, I may say, I have been less troubled with covetousness and cares than many other evils. I rather inclined to solitariness than company. I was much troubled with wandering of mind and idle thoughts. For outward things I never was rich, and I never was in want; and I do not remember that I ever borrowed money, but once in Ireland five or six pounds, and got it shortly paid. I choosed rather to want sundry things than to be in debt. I never put anything to the fore of any maintenance I had; yea, if it had not been for what I got with my wife, and by the death of her brother and some others of her friends, I could hardly have maintained my family by any stipend I had in all the three places I was in."

The remainder of his life was spent in a manner more agreeable, perhaps, to his natural disposition than any preceding part. He had all along had a desire to obtain leisure for study, but was so closely pressed by his ordinary duties that he could not obtain it. He now devoted himself entirely to his favourite pursuit of biblical literature, and had prepared a polyglot Bible, which obtained the unqualified approbation of the most learned men in Scotland, when he was cut off, on the 9th of August, 1672, in the seventieth year of his age. Just before he expired, his wife, foreseeing the approach of dissolution, desired him to take leave of his friends. "I dare not," said he, with an affectionate tenderness; "but it is likely our parting will be but for a short time." Mr. Livingston, besides his Bible (as yet unpublished), left notes descriptive of all the principal clergymen of his own time, which, with his memoirs, were printed in 1754. Some of his children emigrated to America, where their descendants have become people of the first distinction and weight in society. The late Dr. John H. Livingston, minister of the Reformed Dutch church in New York, professor of divinity to that body, and president of Queen's College, New Jersey—one of the first men of his age and country, and to whose memoirs by Mr. Alexander Gunn we have been indebted for some of the preceding facts—was the great-great grandson of the subject of this memoir.

LIZARS, JOHN. This distinguished surgeon and teacher of surgery was born in Edinburgh; but in

what year of the last century has not been stated. He was educated at the high-school of that city. Resolving to follow the medical profession, he was so fortunate as to become the pupil and apprentice of John Bell, the elder brother of Sir Charles Bell, of whom biographical notices have been given in this work. Thus Lizars obtained for his master and teacher one of the most accomplished masters in surgery and anatomy; and being the right pupil for such a preceptor, his progress in these departments, to which he naturally directed his whole attention, was correspondent to his advantages. In short, his professional character was insensibly moulded in that of John Bell, than whom he could not have found a better exemplar. Having obtained his diploma in 1808, Lizars passed several years as naval surgeon during the Peninsular war, and served on the Spanish and Portuguese coasts in the fleet commanded by Lord Exmouth. One of the ships in which he served had for its captain Charles Napier, afterwards the distinguished admiral and hero of Acre, and between the pair a warm friendship was formed, which lasted for life.

On leaving the sea-service in 1815, Lizars returned to Edinburgh, and was admitted a fellow of the Royal College of Surgeons in that city. So highly also was he valued by his former master, John Bell, that he was admitted into the partnership which subsisted between Bell and Robert Allan, the eminent surgeon, and author of the well-known work entitled *Allan's Surgery*. Soon after forming this connection, Mr. Lizars began to lecture in the school with Allan, the former on the department of anatomy and physiology, and the latter on surgery. In a few years the partnership was dissolved, when Lizars continued to lecture on anatomy alone at the theatre, No. 1 Surgeon's Square, which had long been distinguished as an anatomical school. Having won a high reputation by his lectures on anatomy, he in the course of four or five years began to lecture on surgery also. This double duty was a weighty undertaking, and exhausting both to mind and body, and required a careful economizing of time and capacity. His method, according to his biographer, was as follows:—"First, a lecture on anatomy from eleven to twelve; secondly, a half-hour's demonstration on anatomy at one o'clock; and, thirdly, the lecture on surgery from two to three. This he did daily, Saturdays excepted; besides which he had a large class of practical anatomy—a department, the conducting of which was then a much less easy or safe matter than it now-a-days proves to us, who have merely to receive bodies under the peaceful operation of the anatomy act." Of the comprehensive efficiency of this extended and laborious range of instruction we are also told by the same authority: "Mr. Lizars' activity and success may be judged when we mention, that on each of his three classes there was an average attendance of about 150 students. His success as a teacher may be said to have been due not only to his ability as an anatomist and surgeon, but to the great attention he paid to his pupils in the time he spent with them, and to the zeal with which he inspired them."

A change that must have been welcomed as a relief at length occurred in this process of teaching, in consequence of a resolution of the Edinburgh College of Surgeons to recognize each teacher for one science only. This judicious plan of confining the utmost talent to its one especial department was an improvement in the science originated by the Edinburgh College of Surgeons, in consequence of the advance of the profession, and the number of its able and eminent practitioners; and the decision set Mr.

Lizars free from the oppression of his double toil. He therefore retained the department of surgery for himself, and consigned to his brother Alexander (afterwards anatomical professor in the university of Edinburgh) his class of anatomy. In 1831 John Lizars was appointed professor of surgery to the Royal College of Surgeons, and in this office he continued to teach and lecture until 1838-39, when he resigned his charge. The vast store of anatomical and pathological specimens which his enthusiastic zeal had collected from his extensive range of private and hospital practice, and most of which specimens were prepared by himself, were devoted by him to the advancement of the science they illustrated. The anatomical museum was consigned to the anatomical class when his brother Alexander became its lecturer; and his surgical museum to the charge of Dr. Handyside, who succeeded him as lecturer on surgery.

It was much that Mr. Lizars should have won so high a reputation when such powerful rivals were in the field. Of these it is enough to mention the names of Barclay, Mackintosh, Fletcher, Argyll Robertson, and John Reid. But perhaps more than these was Liston, who was also his colleague at the hospital. But although they taught and operated side by side, while each had his fame and followers, no petty jealousy interfered to mar their mutual cordiality. While senior operating-surgeon of the Royal Infirmary, Lizars had frequently to perform difficult operations in which Liston also excelled; but in both there was the same professional knowledge and skill, the same firmness of nerve, and the same exquisite delicacy of touch that carried them successfully through the most critical experiments upon the living subject, and left the question undecided as to which of them should be reckoned the greater. "Mr. Lizars," says his biographer, from whom we again quote, "could be equalled as an operator, but could not be surpassed. He had the ease and trust brought by that thorough familiarity with anatomy which years of teaching in the dissecting-room can alone supply, and a rich endowment of that natural coolness which is to the surgeon what natural bravery is to the soldier. None who witnessed it are likely to forget the coolness and dexterity with which he performed the then laudable but anxious experiment of exposing and tying the innominate artery; no one, probably, of the large and eager audience so cool as the operator himself. It will be remembered, too, that surgery is indebted to him for the introduction of the operation of removal of the upper jaw." Nor was it to lecturing and practice only that the cares of Professor Lizars were confined, in which case the best of his fame might have passed away with him, and left nothing but a vague memory behind. His writings were numerous in medical journals, and the chief of his published treatises on professional subjects were *On the Extraction of Diseased Ovaria; On Club-foot; On Strabismus; On Stricture*; and his well-known *System of Practical Surgery*. But it was chiefly by his large anatomical work, the *Anatomical Plates*, that he was best known in his day. It was a noble attempt, in the prevalent difficulty of procuring subjects, to assist students with substitutes; and the engravings of this splendid work, which were executed with great care and at much expense, were made chiefly from original dissections. Its usefulness was indicated by its immense sale irrespective of the cost; and although the superior facilities now afforded to the study of anatomy have made all such aids less necessary, it is still consulted with benefit both by the student and surgeon.

After he had abandoned the office of public teacher and lecturer, Professor Lizars devoted his time to

private practice, surgical and general, and in this he continued during the last twenty years of his life, with occasional appearances as an author. It was in keeping with his long and hard-working career, that at the close he should die in harness. On the 20th of May, 1860, he had been out as usual in the forenoon on his round of professional duties, but feeling drowsy, had returned home. Insensibility gradually grew upon him without any return of consciousness, and on the following evening he died without pain.

LOCKHART, SIR GEORGE, a distinguished constitutional lawyer, and lord-president of the Court of Session, was the second son of Sir James Lockhart of Lee, a judge of the Court of Session. The period of his birth is unknown, and the earliest circumstance of his life which has been recorded is, that he studied for the bar, to which he was admitted on the 8th of January, 1656, by the commissioners appointed for the administration of justice in Scotland under the government of Cromwell.¹ The well-known personal interest of his brother Sir William Lockhart with the Protector, was probably the means of introducing his talents to early notice; and on the 14th May, 1658, he was appointed "sole attorney," or lord-advocate of Scotland. On the restoration of the monarchy his family influence procured him favour at court; and after taking the oath of allegiance, along with the performance of other somewhat humiliating ceremonies, expressive of regret for his support to the fallen government, he was permitted the exercise of his profession, and received the honour of knighthood in 1663. Sir George distinguished himself as an able barrister, and became a man of power and influence. Notwithstanding favours extended towards him, such as monarchs too often find sufficient to secure unhesitating tools, he used the privileges of his profession frequently against the court; and through the progress of the dark deeds perpetrated by Tweeddale and Lauderdale, his name frequently occurs in the Books of Adjournal (the criminal record of Scotland), as using his professional abilities in favour of the Covenanters. One of the most prominent features of his life is the struggle which he headed in 1674 for procuring by indirect means, and partly through the influence of the bar, an appeal from the courts of law to the legislature, unauthorized by the theory of the constitution of Scotland, and directly against the wishes of the court, to which a body of paid judges, removable at pleasure, seemed a more pliable engine than an assembly of men, partly elected, partly holding by hereditary right. He was the person who, in the suit between the Earl of Dunfermline and the Earl of Callender and Lord Almond, advised the last-mentioned to present an appeal to parliament.² The earl being cited before the privy-council to answer for this act, applied to Sir George Lockhart, Sir Robert Sinclair, Sir George Cunningham, and Sir George Mackenzie, for information how to act in the matter; and a paper was drawn up for him by these eminent men, declaring "that he desired nothing thereby, but to protest for remeid of law;" in other words, that he did not wish the decree of the Court of Session to be reduced on the ground of injustice or oppression, but a revisal by the parliament, declaratory or statutory, as to the law on the point. "In all which," says Sir George Mackenzie, with the bitterness of

disappointment, "Sir George Lockhart's design was to bring in this trial before the parliament, hoping thereby that they would lay aside the president, and leave the chair vacant for him." Lauderdale immediately proceeded to court, accompanied by the president of the Court of Session and one of the judges; and on their report of the proceedings Charles found the matter of sufficient importance to demand personal interference, and wrote a letter to the privy-council, in which, expressing his conviction of the necessity of preserving the supreme power of the College of Justice, and his "abhorrence" of appeals, he was graciously pleased that no proceeding should be instituted against those who had maintained the political heresy, in case they disavowed it; but that if they did not, they should be debarred the exercise of their professions. The consequence of this letter was the banishment of Lockhart and Cunningham, and the voluntary exile of fifty advocates, who chose to resent the insult: but the manner in which the act is detailed by Sir George Mackenzie, and the curious views which he casts on the motives and conduct of his great rival, prompt us to extract the passage:—"His majesty having ordained by his letters such as would adhere to that appeal to be debarred from pleading, and Sir George Lockhart and Sir John Cunningham being thereupon called in before the lords, they owned that though formal appeals might be said to be contrary to the 62 act. Par. 14 James II., yet a protestation for remeid of law might be allowed; whereupon they were debarred from their employments till the king should declare his further pleasure. And albeit it might have been reasonably concluded that this exclusion should have pleased the younger advocates whom those seniors overshadowed, interrupting the chief advantage and honour that was to be expected in that society; yet most fearing to offend so eminent men, who they knew would soon return to their stations, and being pushed on by the lords of the party, and the discontented persons to whom they owed their employments, went tumultuarly out of the session-house with those who were debarred; and thus, as Sir George Lockhart broke that society at first by his avarice in the matter of the regulations, he broke them now again by his pride in the matter of the appeals; and by raising a clamour against the president, and joining in the popular dissatisfaction, he diverted early from himself that great hatred which was so justly conceived against his insolence and his avarice—two crimes which were more eminent in him than his learning."

Although the causes of the enmity entertained by Mackenzie towards Lockhart are not fully explained, the allusions of the former make it quite clear that it arose from professional and political rivalry. The king had written to the burghs, advising them to renew their old acts against the choosing of representatives. "The king's design in this was," says Sir George, "to exclude such as had been factious in the former parliament, and to engage the burghs to an immediate dependence on the crown." The disaffected advocates endeavoured to inspire the burghs with a wish to oppose the designs of the court; in the meantime, however, it was necessary that the king's letters should be answered, and a draught of such a document was prepared for the committee by Sir George Mackenzie. This letter was sent for the perusal of Lockhart, who altered it "so as of a discreet and dutiful letter, it became, by adding what was humorous, and striking out what was discreet, a most unpolisht and indiscreet paper. And when Sir George Lockhart was askt why he had deformed it so, his answer to James Stewart was, that it was fit to make Sir George Mackenzie unpardonable."

¹ Brunton and Haig's *Hist. of Col. of Just.* 419.

² Those readers who are not acquainted with the details of this event, may find such circumstances connected with it as are here omitted, in the life of SIR JOHN LAUDER OF FOUNTAINHALL.

Sir George Mackenzie alleges that Lockhart had induced him to join the body in favour of appeals on the ground that the union of so many members of the bar would form a formidable opposition to Lauderdale; and it is to his enmity against that minister at the period, that, without a better reason, we must date Mackenzie's accession to the cause. But when the king, on the 12th of December, issued a proclamation, declaring, on the word of a prince, that such of the advocates as should not petition for re-admission before the 28th of January following should never be permitted to return to their profession, Sir George Mackenzie "did so much tender the reputation of his king, that he, having been bedrid of a broken leg when the rest were debarr'd, shunn'd to have himself debarr'd, or publicly to own the appeal; though to secure such as had, he declared that he would not return to his employment without them. Which not satisfying Sir George Lockhart, who pressed still that Sir George Mackenzie should be debarr'd, he was content, in a letter under his hand, to oblige himself in those terms; but this letter not having satisfied, and he being prest, merely to satisfy Sir George Lockhart's private humour, he called for his former letter, and wrote in a postscript these words: 'But if I enter and put myself in the same condition with the rest, I do declare this letter, and all the obligations therein, to be void and not obligatory.' And having owned the appeal with a very undaunted courage, did from that hour despise that party which had jealous'd him, after so many proofs of his courage and fidelity, to please a little creature, who had never follow'd them, but his own passion, to which he and they were become such slaves, that they had thereby lost the glory and reputation of impartial reformers, which had so much recommended them at first, while they followed *Sir George Mackenzie's* disinterested advices." Mackenzie then adds a circumstance, which will hardly diminish the suspicion of his tortuous conduct in the business, although it may shed a ray of additional light on the causes of his rancour towards Lockhart. This is the letter from which the party concluded Sir George Mackenzie to be guilty of perjury, in having entered before the rest; dispersing copies of the letter without the postscript, because they knew the postscript destroyed their malicious pretences. Before the day which the court had named as the last for receiving the submission of the recusant advocates, a document, couched in the form of a petition, but steadily vindicating the right of appeal for remedy of law, was presented to the privy-council. This very valuable paper, which has been preserved at full length by Mackenzie, is full of legal knowledge and clear concise reasoning; it had, however, to strive, not only against power, but also against precedent; no clear established law could be found on which to rest the right of appeal, and a course of ingenious special pleading had to be derived from implication, and the plea that the Court of Session was a distinct body from the daily session of old, which, being a committee of parliament set apart for the purpose of saving the time and trouble of the main body, would have defeated its end by the admission of appeals. The grand constitutional argument of a check on the venality of judges could only be hinted at under the cloak of deference and submission to the royal authority; and the petitioners thought it prudent to terminate their certainly firm and manly statement of their rights with the concession, that "as the petitioners acknowledge there are eminent lawyers upon the session, of deserved reputation; so, if the lords of session, by an act of sederunt or otherwise, will plainly and clearly declare that protestations for remedy of law, to his

majesty and estates of parliament, were and are in themselves unlawful, and that the parliament cannot thereupon review and rescind their decreets, if they find just cause; the petitioners will so far defer to their authority, as to be concluded thereby, and satisfy what was prescribed and required by the lords of session as to that point." Mackenzie was induced to sign this petition: he says, "Sir George Lockhart's love of money making him weary of that love to revenge, he persuaded the appellars (for so all the adherers were called) to give in an address to the privy-council; but so bitter and humorous, that Sir George Mackenzie, though he had concurr'd in furnishing materials and argument, did with some others dissent from it; till they were again conjur'd by some of their comrades not to make a rupture at a time wherein their fixt adherence to one another was their only security."¹ The petition was viewed by the privy-council and the king as a daring and seditious piece of pleading; and Sir John Cunningham proceeding to London to endeavour by his personal influence to alleviate the threatened effects, was quickly followed by Sir George Lockhart and Sir Robert Sinclair; "but upon express promise," says Mackenzie, "that if Sir George Mackenzie and those who had signed the address should be pursu'd for it, they should return and concur with him in the defence. Notwithstanding whereof," he continues, "they having been pursu'd in a process before the privy-council, Sir George Lockhart and Sir Robert Sinclair retir'd, and lurk't near to North Allerton, without acquainting even their wives of their residence, lest thereby they might have been advertis'd. Whereupon Sir George Mackenzie gave in his defence," &c. The defence deserted the constitutional origin of the struggle, and assumed the aspect of a mere vindication of the motives of presenting the petition. Mackenzie at length yielded; as a motive for so doing he says—but we are aware of no document that confirms the assertion—that he "intercepted at last a letter, wherein they (Lockhart and Sinclair) told their confidants that they had resolved to wait the event of that process; in which, if Sir George Mackenzie was absolved, they would be secure by the preparative; but if he was found guilty, the malice of the pursuers would be blunted before it reacht them." Accordingly, on the plausible ground that "it was no dishonour to submit to their prince, ceding being only dishonourable amongst equals, and never being so when the contest was rais'd by such as design'd to make them knaves and fools," he prevailed on the greater number of his brethren to submit. Sir George Lockhart, left to maintain the struggle almost alone, fully aware that unanimity and number only can give effect to political resistance, presented a tardy submission in December, 1675, and was re-admitted to the privileges of his profession on the 28th of January, 1676.² We have dwelt thus long on this incident, because it is one of the very few constitutional

¹ With the petulant remarks on Lockhart, so plentifully scattered through the above quotations, compare the following published character of the professional abilities of his great rival by Sir George Mackenzie, in his *Eloquence of the Bar*—it would be difficult to conceive a more perfect picture of a great forensic orator:—"Lockartius corpus alterum juris civilis, alterque Cicero dici poterat. Illi etiam peculiare erat argumenta sua eo ordine disponere, ut tanquam lapides in fornice alter alterum sustineret; quæ ex improviso, dum oraret, ei suggererantur, prompta solertia indicabat, aptisque locis disponebat. Nihil ab eo abscondit jurisprudentia, et quamprius casus illi a cliente aperiretur, sua omnia, omniaque adversarii argumenta retexebat. Iracundia, quæ alios oratores turbabat, eum tantum excitare solebat; vocem tamen latratu, vultumque rugis deformabat."

² Mackenzie's *Memoirs*, 267-310.

struggles connected with the history of Scotland, and the curious details lately brought to light in the *Memoirs* of Sir George Mackenzie are not very generally perused.

The next political transaction in which we find Lockhart professionally engaged, is the trial of Mitchell, in 1678, for having four years previously attempted the murder of Archbishop Sharpe. He was tried on his own confession, and there is no point of history more surely ascertained, or less liable to doubt, than that the confession was obtained on a promise of pardon. "But," as Burnet expressively says, "Sharpe would have his life." For the purpose of facilitating the prosecution, Nisbet, the lord-advocate, was superseded by Mackenzie; and Primrose, from being clerk-register, was appointed justice-general. "He fancied," says Burnet, "orders had been given to raze the act that the council had made (the act offering the conditional pardon), so he turned the books, and he found the act still on record." He took a copy of it and sent it to Mitchell's counsel.¹ Thus armed, Lockhart appeared, to meet the confession. Burnet, who says, "He was the most learned lawyer and the best pleader I have ever yet known in any nation," states that "he did plead to the admiration of all, to show that no extrajudicial confession could be allowed in a court. The hardships of a prison, the hopes of life, with other practices, might draw confessions from men when they were perhaps drunk or out of their senses. He brought upon this a measure of learning that amazed the audience, out of the lawyers of all civilized nations. And when it was opposed to this that the council was a court of judicature, he showed that it was not the proper court for crimes of this nature, and that it had not proceeded in this as at a court of judicature. And he brought out likewise a great deal of learning upon those heads. But this was overruled by the court, and the confession was found to be judicial. The next thing pleaded for him was, that it was drawn from him upon the hope and promise of life: and on this Sharpe was examined. The person he had sent to Mitchell gave a full evidence of the promises he had made him; but Sharpe denied them all. He also denied he ever heard any promise of life made him by the council; so did the Lords Lauderdale, Rothes, and Halton, to the astonishment of all that were present. Lockhart upon that produced a copy of the act of council, that made express mention of the promise given, and of his having confessed upon that. And the prisoner prayed that the books of council, which lay in a room over that in which the court sat, might be sent for. Lockhart pleaded that since the court had judged that the council was a judicature, all people had a right to search into their registers; and the prisoner, who was like to suffer by a confession made there, ought to have the benefit of those books. Duke Lauderdale, who was in the court only as a witness, and so had no right to speak, stood up and said he and those other noble persons were not brought thither to be accused of perjury; and added, that the books of council were the king's secrets, and that no court should have the perusing of them. The court was terrified with this, and the judges were divided in opinion. Primrose and one other was for calling for the books, but three were of opinion that they were not to furnish the prisoner with evidence, but to judge of that which he brought, and here was only a bare copy, not attested upon oath, which ought not to have been read. So this defence being rejected, he was cast and condemned."² Perhaps the

annals of crime scarcely produce another so perfect specimen of judicial villany.

The talents and courage of Lockhart were employed by the Earl of Argyle at his memorable trial in 1681; three times the privy-council denied him the sanction of their warrant—unfortunately often necessary at that period for the safety of the lawyer who should defend a person accused of treason—and it was at last granted, lest Argyle, on the ground that he was deprived of legal assistance, might interrupt the trial by refusing to plead. In the parliament of 1681 he was appointed one of the commissioners of the shire of Lanark, a seat which he held till his death; and in 1685, after the fall of his opponents in the ministry, we find him one of the committee appointed to answer the king's letter to the parliament, and a lord of the articles.³ In 1685, on the death of Sir David Falconer of Newton, Lockhart was appointed president of the Court of Session, and was soon afterwards made a privy-councillor and a commissioner of the exchequer. Having in the year 1679 boldly undertaken the task of representing before the king the grievances against Lauderdale, he was considered one of the chief political opponents of that minister, and seems to have been gradually led to a participation with the proceedings of the Duke of York. After having followed the actions of a high-minded man through the path of honour, and seen him use his talents and influence in the protection of the weak, and resistance to the powerful, it is painful to arrive at transactions in which the presence of his accustomed firmness or integrity may seem wanting. He is said to have been at first opposed to a repeal of the penal laws against Papists, but after a journey to London, concerted for the purpose of overcoming his scruples, to have entertained a different view⁴—a view which, it is to be feared, was produced more by the benignant smile of royalty, than by a sudden accession of liberal principles. On the question of the applicability of the disabling laws to the Duke of York, he somewhat sophistically maintained that "a commission to represent the king's person fell not under the notion of an office."⁵ But, if he chose to assist the court in obtaining its ends by legal means, his former spirit returned on an attempted stretch of arbitrary power, and he objected to the privy-council's sanctioning a relaxation in favour of the Roman Catholics, becoming law, through the mere royal prerogative.⁶

This great man, whose talents and courage would have adorned a better period, fell a victim to the fury of one of those savages which misgovernment produces. He was murdered by John Chiesley of Dalry on the 31st of March, 1689.

The determination to commit the murder on the part of this man arose from a dispute with his wife, the latter claiming alimony for herself and ten children, and the parties consenting that the claim should be settled by the arbitration of Lockhart and Lord Kennay, who gave a decree appointing an annual sum out of Chiesley's estate to be paid to his wife. Infuriated at not being permitted to deprive his wife and offspring of their daily bread, he formed the resolution of taking vengeance on the president at whatever cost. On communicating his intention to Mr. James Stewart, advocate, he was answered that "it was a suggestion of the devil, and the very imagination of it a sin before God;" to which he replied, "Let God and me alone; we have many things to reckon betwixt us, and we will reckon this too."

² Act Parl. viii. 456-7.

⁴ Burnet, i. 406.

³ Fountainhall's *Diary*, 167.

⁵ Fountainhall, 192.

The victim, it appears, was informed of his intention; but he disdained precautions. The murderer confessed that, when in London, he had walked up and down Pall-mall, with a pistol beneath his coat, lying in wait for the president. The day on which he consummated the deed was Sunday. He charged his pistol and went to church, where he watched the motions of his victim, and when Lockhart was returning to his own house through the close or lane on the south side of the Lawnmarket, now known by the name of the "Old Bank Close," following close behind him, discharged a shot, which took effect. The president fell, and being carried into his own house, immediately expired, the ball having passed through his body. Chiesley did not attempt to escape, and, on being told that the president was dead, he expressed satisfaction, and said "he was not used to do things by halves." He was put to the torture and made a full confession, and having been seen committing the act, and apprehended immediately after, or as it is technically termed "red hand," he was summarily tried before the provost of Edinburgh, as sheriff within the city. He was sentenced to have his right hand cut off while alive, to be hanged upon a gibbet with the instrument of murder suspended from his neck, and his body to be hung in chains between Leith and Edinburgh.¹

LOCKHART, GEORGE, a celebrated political partisan, and author of *Memoirs concerning the Affairs of Scotland, Commentaries, &c. &c.*, was the eldest son of the above, by Philadelphia, youngest daughter of Philip, fourth Lord Wharton. He was born in the neighbourhood of Edinburgh, in the year 1673. He appears to have been educated for the Scottish bar, but having succeeded, on the death of his father, to a very ample fortune, he seems to have turned his attention chiefly to politics, and having obtained a seat in the Scottish parliament, 1703, he distinguished himself by his opposition to all the measures of the court, and his ceaseless activity in behalf of the fallen Episcopal church and the exiled royal family. Singularly unlike his father in discernment of the justice of a cause and liberality of principle, he appears to have resembled him in the stubborn courage with which he pursued any favourite object. To all the principles of the Revolution he professed a deep aversion; and the union of the kingdoms of Scotland and England he considered, especially in regard to the former, as likely to terminate in that misery which a peculiar class of politicians always argue to be the consequence of any change. He was, however, named by the queen one of the commissioners upon that famous treaty, and, with the exception of the Archbishop of York, was the only Tory that was so named. "He had no inclination to the employment," he has himself told us, "and was at first resolved not to have accepted it, but his friends, and those of his party, believing he might be serviceable, by giving an account how matters were carried on, prevailed with him to alter his resolution." Before entering upon the duties of his high office, he accordingly took their advice in what manner he was to conduct himself, and in particular, "whether or not he should protest and enter his dissent against those measures, being resolved to receive instructions from them, as a warrant for his procedure, and to justify his conduct: so, when they all unanimously returned this answer, that if he should protest, he could not well continue longer to meet with the other commissioners; and, if he entered his dissent, it would render him odious to

them, and that they would be extremely upon the reserve with him, so as he would be utterly incapable to learn anything that might be useful afterwards in opposing the design; whereas, if he sat quiet, and concealed his opinion as much as possible, they, expecting to persuade him to leave his old friends and party, would not be so shy, and he might make discoveries of their designs, and thereby do a singular service to his country; therefore they agreed in advising him neither to protest or dissent, nor do anything that might discover his opinion and design, unless he could find two or three more that would concur and go along with him (which was not to be expected), but to sit silent, making his remarks of everything that passed, and remain with them as long as he could; and then, at last, before signing the result of the treaty, to find out some pretence of absenting himself." Such were the feelings and intentions which he brought to the accomplishment of a transaction which he was chosen for the purpose of furthering, in the most expeditious and most efficient manner; and he relates with pride that he acted up to his instructions, that he acted as a spy on the proceedings of the others, and at least was enabled to interrupt and render more laborious the consummation of a measure which his party was unable to stifle. The archbishop, disdaining to follow a similar course, absented himself from the meetings.

But Lockhart had other and more dangerous duties to perform for his party; he held a commission from the Scottish Jacobites to communicate with the English Tories, and if possible to ascertain how far the latter might be brought to concur in a scheme, projected in Scotland, for the restoration of the son of the abdicated monarch by force. This commission he executed with similar fidelity, but he found the English less zealous than the Scots, and disinclined to any attempt, at least during the lifetime of the queen. All the transactions which might be interesting to the exiled family he faithfully reported to the courts of Versailles and St. Germain, through the instrumentality of an emissary called Captain Straiton, while he submitted his proceedings to the cognizance of his brother Jacobites, whom he aptly termed his constituents. His account of the proceedings of the commissioners is distorted by party colouring beyond the usual allotment of such documents, and one is tempted to ask how a person who saw in every branch of the proceedings something so irredeemably wicked, could have so far compromised his conscience, as to have permitted himself to be chosen as one of those whose duty it was to assist in and further them.

The scheme of a general rising was designed for the purpose of stifling the projected union; but the attempt having failed, the Jacobites were compelled to debate the treaty, clause by clause, in open parliament, where, notwithstanding every artifice for exciting public clamour, it was triumphantly carried. Lockhart, through the whole, was uniform in his opposition—adhered to every protest that was taken against it, and, in more than one instance, entered protests against it in his own name. He also, in conjunction with Cochrane of Kilmarnock, gave fifty guineas to Cunningham of Aiket, for the purpose of forwarding a design of forcibly dispersing the parliament by an army of Cameronians, which he proposed to raise in the western shires, but which, as he alleged, he was prevented from doing by the intrigues of the Duke of Hamilton.

The union having been ratified by the parliaments of both kingdoms, and peaceably carried into effect, the next hope of the Jacobites was the French invasion, which Hooke had negotiated with them during

¹ Annot's *Crim. Tr.* 268-74.

the preceding year, and to which they now looked forward with the most ardent expectation. Of all the partisans of James, perhaps none were more zealous, on this occasion, than the subject of this memoir; but, fortunately for himself, he followed in the train and acted by the advice of the Duke of Hamilton, who, being at the time at his seat in Lancaster, and taken there into custody by a king's messenger, could not meet his Scottish friends at Dumfries, according to agreement, till the defeat of the French fleet rendered any further appearance at that time unnecessary, in consequence of which he himself, as well as his friends, escaped anything like serious prosecution. Mr. Lockhart also, having the powerful influence of his uncle Lord Wharton exerted in his favour, remained unmolested.

The next hope of the Jacobites was in the inclinations of the queen, which, with all her coldness, they naturally expected, and indeed had, if we may believe their own account, and lay much weight on a few accidental circumstances, a well-grounded hope, that they might be extended to her brother and his family; and that they might more effectually influence her counsels, it was resolved that no influence or endeavour should be spared in procuring seats in parliament for the heads of the party. Mr. Lockhart started for the county of Edinburgh, and had sufficient interest to secure his election, though he was obnoxious both to the court and the Presbyterians, to whom he seems to have been always inimical. The first session of the first British parliament did not afford much scope for that species of ingenuity for which Mr. Lockhart has taken so much credit to himself; and by his efforts, joined to those of Mr. Houston younger of Houston, Lag younger of Lag, Duff of Drummure, and Cochrane of Kilmaronock, all unwavering supporters of the same political creed, little or nothing was effected. The next session was almost wholly occupied with the affair of Sacheverel, in whose behalf the Jacobites were joined by those supporters of the house of Hanover who either conceived, or for political purposes alleged, that the church was in danger, while the affairs of Scotland were neglected amidst more exciting discussions. A field was soon, however, to be opened, in which they doubted not shortly to reap a rich harvest.

At the period when a waiting-woman in the queen's bed-chamber was sapping the foundation of the Godolphin and Marlborough administration, that ministry requested leave to dismiss Mrs. Masham, threatening her with an address from the two houses of parliament; to which was to be attached an invitation to Prince George of Hanover. "As such treatment much chagrined the queen against her ministry," says Lockhart, "she was very desirous to secure herself against such attempts, and did avowedly solicit a great many members of both houses of parliament, that they would not consent to a motion to deprive her of the liberty allow'd to the meanest housekeeper in her dominions, viz. that of choosing her own domestic servants."—"And I accordingly," continues the narrator, in a very remarkable passage bearing on one of the most obscure points in British history, "procured an address, in a very high monarchical style, from the barons and freeholders in the county of Edinburgh; and having brought it up with me when I came to parliament, I was introduced by the Duke of Hamilton to present the same; and having read it to her majesty, she seemed very well pleased, gave a gracious return to the address, and then told me, tho' I had almost always opposed her measures, she did not doubt of my affection to her person, and hoped I would not concur in the design

against Mrs. Masham, or for bringing over the Prince of Hanover. At first I was somewhat surprised, but recovering myself, I assured her I should never be accessory to imposing any hardship or affront upon her; and as for the Prince of Hanover, her majesty might judge from the address I had read, that I should not be acceptable to my constituents if I gave my consent for bringing over any of that family, either now or any time hereafter. At this she smiled, and I withdrew; and then she said to the duke, she believed I was an honest man; and the duke replied, he could assure her I liked her majesty and all her father's bairns."¹ The gradual steps towards a delicate and dangerous subject, so naturally laid down in this valuable passage—the hope expressed by the queen that the Jacobite partisan was averse to the removal of the favourite and the introduction of the prince—the surprise of the Jacobite, and his ingenious extension of the request—the queen's smile and remark on his honesty—and, finally, the cautious but bold extension of the insinuations in the kindly rejoinder of the duke, all speak to the authenticity of the scene, and the accurate observation of the narrator. That he may be depended on there is little doubt. The cautious Hallam considers that the *Lockhart Papers* sufficiently prove that the author "and his friends were confident of the queen's inclinations in the last years of her life, though not of her resolution." Nor can a vanity to be esteemed the depository of the secrets of princes be likely to operate on a man whose works are not to be witnessed by his own age. On the whole, the passage may be said almost to prove that the queen's "inclinations" were with her brother; but a "resolution" on either side she appears to have never attained.

The circumstance last mentioned was soon followed by the renowned downfall of Anne's Whig ministry. Strong but ineffectual attempts were made by the Whigs at the elections. Lockhart was violently opposed in Edinburghshire, but carried his election by a great majority; as did Sir Hugh Paterson of Bannockburn for the shire of Stirling, and Sir Alexander Areskine, lord lyon king-at-arms, for the shire of Fife, both thorough-paced Jacobites and violent Episcopalians. The last of these gentlemen, along with Mr. Carnegie of Boysack, Mr. James Moray, second son to the Viscount Stormont, afterwards created by the Pretender Lord Dunbar, and Sir Alexander Cuming of Cantar, joined Mr. Lockhart in a close confederacy, agreeing to mutual support in cordially prosecuting the great objects for which they had come into parliament, viz. the dissolving of the treaty of union, and the breaking up of the Protestant succession. Keeping their agreement as secret as was compatible with its efficacy, and prudently cultivating the friendship of the English Tories, they soon became conspicuous, and were regarded by both sides of the house as men of superior consequence, whose feelings and views it was necessary to consult in all measures regarding Scotland. The first fruit of this confederacy was a breach of the union, committed by the House of Lords, in reversing a sentence of the magistrates of Edinburgh, which shut up the meeting-house of a Mr. Greenshields, the first clergyman who introduced the English liturgy into the service of the Scots Episcopal church. The full harvest was the act of toleration, with the oath of abjuration annexed, to be imposed upon all the ministers of the Scottish church; the act restoring lay patronage; and the act for the observing certain holidays, all of which

¹ *Lockhart Papers*, i. 307.

were prepared by Mr. Lockhart, and by him and his friends forced upon the ministry, contrary to the expressed opinion of the people, and with the avowed purpose of undermining the Presbyterian interest.

At the same time that he was so deeply engaged in forwarding the particular views of himself and his friends, in regard to affairs purely Scottish, Mr. Lockhart was also employed upon the more general business, or what may be called the drudgery, of the house. He was one, and the only Scotsman, who was upon the commission of the house for examining the national accounts, with the view of criminating the ex-Whig ministers; and, as chairman of that commission, gave in a long report, intended to implicate the Duke of Marlborough, a person whose conduct was certainly not pure, while it still affords a pleasing contrast to that of his accusers. The report, however, when it came to be examined, discovered only the headstrong party spirit of its authors, and not much against the accused but the usual political corruption, too characteristic of the period.

The duties of a commissioner upon the national accounts did not, however, by any means absorb the whole attention of the indefatigable Lockhart, for while he devoted himself to the service of the Pretender, he also proposed a bill in parliament to bestow upon curates the bishops' rents, and to resume all grants of church property that had been made to the universities, which he declared to be public nuisances, mere nests of rebellion, which could not be soon enough annihilated. The service to be accomplished in favour of the exiled family by these measures is not very clear, and we are prevented from knowing the effect their proposal would have produced, from his friends declining to adopt them. So high, indeed, was he borne by his zeal, that an order was obtained by his friends from St. Germain's, recommending to him moderate measures, and dissuading him from attempts to openly force the English ministry upon desperate projects, as they were themselves well enough disposed, and were the best judges of the means whereby their good intentions would be carried into effect. This order he dared not disobey, but he owns it was much against his inclination, and takes the liberty of affirming that it injured the Pretender's interest.

On the Duke of Hamilton being appointed ambassador to the court of France, he selected the subject of our memoir to wait privately upon him, and to act according to his orders upon an affair of extraordinary moment which he never explained, but which Lockhart understood to be the Pretender's restoration, and he was just leaving Scotland with the hope of being called to accompany the duke upon that pleasing duty, when he heard that a quarrel betwixt Hamilton and Lord Mohun had brought both these distinguished noblemen to an untimely end. This circumstance he affirms to have been fatal to the hopes of the Pretender, no one having been found capable of conducting so delicate a business till the period when disputes in the cabinet and the death of the queen rendered the case hopeless. But these circumstances did not damp his ardour, or prevent him from impeding the government which he could not overturn. Accordingly, on the attempt to extend the malt-tax to Scotland, in the year 1713, he made a desperate effort, in which he was seconded by the Earls of Mar, Eglington, Ilay, &c., for the dissolution of the union, a project which narrowly failed of success, as we have narrated more at large in the life of John Duke of Argyle. The attempt to assimilate the Scottish to the English militia which followed, he resisted, and,

in his personal friendship, defended the hereditary title of the Duke of Argyle to the lieutenancy of the county of Argyle. His friends, who could not see the advantage of such a measure, were displeased, but his design was to bring over the duke to the interests of the Pretender, of which he was always suspicious the ministry were less careful than of their own. He, however, continued to sit and to act with them, under the strongest assurances from Bolingbroke, that everything he could desire would be done for the Pretender so soon as it was possible to do it with safety, till the prorogation before the death of the queen, when he retired to his residence in the country, and though the same parliament was assembled on the death of the queen, did not attend it, having lost all hope of the Pretender's restoration by other means than arms.

He accordingly began privately to provide horses and arms for himself and his dependants, though from his late conduct he was not trusted by the leaders of the party to the extent that might have been expected. Nothing, indeed, but mere general surmises seem to have reached him till the month of August, 1715, when warrants were already issued out against all who were suspected as favouring the designs of the Earl of Mar, and under one of these warrants he was, early in that month, apprehended at his house of Dryden, and committed prisoner to the castle of Edinburgh. In these circumstances he immediately wrote to the Duke of Argyle, who, in return for his services in regard to the militia bill, procured his enlargement, after he had been fifteen days a prisoner, on his giving bail for 6000 merks. He was no sooner liberated than he waited upon his rebel associates who had not been apprehended; but finding them still disinclined to the communication, he retired to his house at Carnwath, where he secretly and diligently employed his personal influence in the furtherance of the cause, though still unacknowledged by any of the ostensible leaders of the insurrection, and waited till the arrival of the Pretender, or the transit of the Forth by Mar, should give the signal for him and his friends to appear in arms. In the meantime a letter from the Duke of Argyle informed him that his practices were well known to the government, and requiring him forthwith to repair to his house at Dryden. Everything—arms, horses, &c.—were again disposed of in the best manner that could be devised, and he immediately repaired to Dryden, where he negotiated with Kenmore and the southern rebels; his troop of horse, under the command of his brother, Philip Lockhart, being sent to join them at Biggar, he himself staying behind for a few days to arrange some minor concerns. To insure his safety after concluding his transactions with the rebels, he wrote to the lord justice-clerk, requesting to know whether he should remain in Edinburgh or go home to Dryden, and was ordered to choose the latter alternative. Mackintosh, however, having that night crossed the Forth on his march to the south, a party of soldiers was sent out to Dryden, who apprehended Lockhart, and carried him again to the castle; a circumstance which saved both his life and his estate, as well as those of many others who were prepared to set out with him on an expedition that proved desperate—his whole troop being taken at Preston, along with the rest of their companions, and his brother shot as a deserter by order of a court-martial.

Mr. Lockhart suffered a long confinement, but escaped, through the steadiness of his friends, that punishment which was likely to have followed his conduct, and which the government, could they have elicited sufficient evidence, would most willingly

have inflicted; but he was by no means cured of his affection for the exiled family, and before two years had elapsed he was employed as an agent to bring up 6000 bolls of oatmeal, to be given to the King of Sweden as the hire or the reward for his setting the Pretender upon the British throne. Of all the attempts made by the party in its despair this was certainly the most singular; yet he seems to have embarked in it with that ardour which marked his character, and he contrived to obtain from the Earl of Eglinton the offer of 3000 guineas towards its accomplishment. It was soon, however, found to be a project which could not be carried into effect. He narrowly escaped being involved in the affair of Glenshiel, and when the Spanish battalion was brought to Edinburgh, he supplied the commander, Don Nicolas, with what money he wanted till he could be supplied with bills from the Spanish ambassador in Holland, telling him, at the same time, that "it was unkind in him to allow himself to be straitened, when he knew the king, for whose cause he suffered, had so many friends in town that would cheerfully assist him."

In 1718 the Pretender commenced a correspondence with Mr. Lockhart, which continued with little interruption till 1727, when it fell into the hands of the government, by what means has never been fully explained, though most probably it was in consequence of a dispute Mr. Lockhart had got into with the Episcopal college respecting the election of a bishop of the name of Gillon, whose ordination was keenly opposed by a number of the presbyters, who objected to the nomination that had been made of him by the Pretender, as unduly influenced by Lockhart, who for a number of years had been the only channel through which they communicated with their exiled prince. Many meetings were held, and much rancour displayed on the subject, by the enraged presbyters, who threatened the consequences of the rebellion, in which most of the parties were implicated, if the consecration was persisted in. The bitterness of the disputants made it impossible for them to be secret: the whole came before the public, and the government being masters of the channel of communication, the earliest packet transmitted to Lockhart was waited for and sent to London. Orders were immediately sent to seize Strahan, a merchant in Leith to whom the packet had been directed, and, under a strong guard of dragoons, to send him to London. Before setting out, however, he was well instructed how to conduct himself, supplied with money by Lockhart and the Earls of Kincardine and Dundonald, with the assurance that if he behaved with firmness, nothing could be brought legally home to him, while his family in the meantime should be carefully seen to, and he himself would gain honour by the incident. Warrants were at the same time issued for the apprehension of Mr. Lockhart and Mr. Corsar, one of his friends. The latter was apprehended at Glammis, but the former, taking the alarm, effected his escape into Durham, where he remained in the house of a friend till the 8th of April, when he sailed for Dort, where he arrived in safety. He immediately wrote to the Pretender, through Lord Inverness, stating the circumstances into which he had fallen, and that he was waiting his master's commands before finally resolving how to dispose of himself. In the meantime he met Lord North and Grey at Brussels, who had also been under the necessity of leaving his native country for dabbling in the affairs of the Pretender, and was thus far on his way to the court of that personage, where he hoped to be trusted with the management of his affairs, which, in the hands of Colonel Hay and James Murray

(created Lords Inverness and Dunbar), were generally supposed to have fallen into disorder, pressing at the same time that Mr. Lockhart should accompany him, and take charge of the affairs of Scotland, while he attended to those of England. Lockhart, however, would not approach the court of the Pretender without his orders, shrewdly suspecting that James was too fond of the Lady Inverness, who was Lord Dunbar's sister, to part permanently with either of the three. The Lord North and Grey proceeded to his destination, but found, instead of the premiership which he expected, an appointment provided for him in the army of Spain, with which he was obliged to be content. Inverness had been nominally superseded by Sir John Graham, who proposed the most flattering terms to Lockhart; but the former was still first in the Pretender's affection, and, along with Dunbar, held the entire management of his counsels, which were, and had long been, very far from what the latter gentleman wished. By their advice, and in pursuance of his own feelings, the Pretender no sooner heard of the death of George I. than he left Bologna for Lorrain in the greatest haste, intending to put himself at the head of the Highlanders, and with their assistance conquer and secure the throne of the three kingdoms; a similar project to that which his son attempted in the year 1745. A messenger was sent to consult Lockhart, who, astonished at the folly of the proposal, assured the Pretender that it would prove the ruin of himself and all his friends, and would deprive him of the power of ever again renewing the attempt. More wise than his son upon a like occasion he accepted the advice, and returned to Avignon. Lockhart tendered him afterwards some long letters containing very good advices, with which he probably had little hope that he would comply, and learning, in the month of April, 1728, that his friends the Duke of Argyle, Lord Ilay, and Duncan Forbes, then lord-advocate for Scotland, had procured him liberty to return and to live at home unmolested, he embraced the opportunity of doing so, nothing being required of him but his simple promise that he would live in peace. He was, however, required to go by the way of London, and to return thanks personally to George II., who was now in possession of the throne. "This," he says, "did not go well down with me, and was what I would most gladly have avoided; but there was no eviting of it; and as others, whose sincere attachment to the king was never doubted, had often preceded me on such like occasions, I was under the necessity of bowing my knee to Baal, now that I was in the house of Rimmon." Having performed this piece of unwilling submission, he returned to his family in 1728, evidently in despair of furthering the cause in which he had so long exerted himself, and determined to resign all connection with politics. Of his after-history we have been unable to learn more than that he was slain in a duel on December 17, 1731, having entered the fifty-ninth year of his age.

He was married on the 13th of April, 1697, to Euphemia Montgomery, third daughter of Alexander, ninth Earl of Eglinton, by his first wife, Margaret, daughter of William Lord Cochrane, son of the Earl of Dundonald. He had seven sons and eight daughters. His eldest son George, possessing somewhat of the prudent foresight of his father, delivered himself up in the year 1746 to Sir John Cope, the day after the battle of Gladsmuir, and was for a considerable time a prisoner at large in England. His grandson George continued with Charles till after the fatal battle of Culloden, after which he escaped to the Continent, and died an exile at Paris some few months before his father, in the year 1761.

As an author Mr. Lockhart is entitled to very considerable praise. His memoirs concerning the affairs of Scotland, and his commentaries, though neither so clear nor so impartial as could be wished, are yet valuable materials for history, and throw very considerable light both upon the individual characters and transactions of those times. And his register of letters is still more interesting, as giving us not only an account of the proceedings, but the acts themselves, of the Jacobites of the period. His memoirs were surreptitiously published during his lifetime, by a friend to whom he had lent them, and a key to the names (given in the published volume in initials) was afterwards circulated. He left his papers carefully concealed, with instructions to his heir to abstain from publishing them till the year 1750; but the connection of his grandson with the rebellion of 1745 rendering their appearance even then inexpedient, they lay unnoticed, until, at the request of Count Lockhart, they were edited by Mr. Anthony Anfrere in 1817.

We have only to add, that in private life his character seems to have been exceedingly amiable, and he enjoyed in a high degree the respect and affection, notwithstanding the contrariety of their political principles, of the best and wisest public man of his age—Duncan Forbes of Culloden.

LOCKHART, JOHN GIBSON. This distinguished miscellaneous writer, who occupied so high a station in the tribunal of literary criticism, was born at Glasgow, and, as is generally supposed, in the year 1793. His father, the Rev. Dr. John Lockhart, who for nearly fifty years was minister of the College or Blackfriars' Church, Glasgow, will not soon be forgotten by the denizens of that good city, not only on account of his piety and worth, but also his remarkable wit and extreme absence of mind—two qualities which are seldom found united in the same character. The stories with which Glasgow is still rife of the worthy doctor's occasional obliviousness, and the amusing mistakes and blunders it occasioned, are even richer than those of Dominie Samson; for, when he awoke from his dream, he could either laugh with the laughers, or turn the laugh against them if necessary. But his remarkable powers of sarcasm, as well as his creative talents in embellishing an amusing story, were so strictly under the control of religious principle and amiable feeling, that he would often stop short when sensitiveness was likely to be wounded, or the strictness of truth violated. It would have been well if the same powers which were so conspicuous in his talented son had been always kept under the same coercion.

Of this amiable divine John Gibson Lockhart was the second son, and the eldest by a second marriage, his mother having been a daughter of the Rev. Dr. Gibson, one of the ministers of Edinburgh. At an early age he prosecuted his studies at the university of Glasgow, and with such success, that he received one of its richest tokens of approval in a Snell exhibition to Baliol College, Oxford. Here he could prosecute, with increased facilities, those classical studies to which he was most addicted; and in a short time he took a high station as an accomplished linguist, even among the students of Oxford. His studies at Baliol College, which were directed to the profession of the law, were followed by a continental tour; and, on returning to Scotland, he was called to the Scottish bar in 1816. It was soon evident, however, that he was not likely to win fame or fortune by the profession of an advocate. He lacked, indeed, that power without which all legal attainments are useless to a barrister—he could not make a speech. Accordingly,

when he rose to speak on a case, his first sentence was only a plunge into the mud; while all that followed was but a struggle to get out of it. Had the matter depended upon writing, we can judge how it would have gone otherwise; had it even depended on pictorial pleading, he would have been the most persuasive of silent orators, for, during the course of a trial, his pen was usually employed, not in taking notes, but sketching caricatures of the proceedings, the drollery of which would have overcome both judge and jury. As it was, he became a briefless barrister, and paced the boards of Parliament House discussing with his equally luckless brethren the passing questions of politics and literary criticism. He made a happy allusion to this strange professional infirmity at a dinner which was given by his friends in Edinburgh, on his departure to assume the charge of the *Quarterly Review*. He attempted to address them, and broke down as usual, but covered his retreat with, "Gentlemen, you know that if I could speak we would not have been here."

In Mr. Lockhart's case it was the less to be regretted that he was not likely to win his way to the honours of a silk gown, as he had already found a more agreeable and equally distinguishing sphere of action. He devoted himself to literature, and literature adopted him for her own. He had already made attempts in periodical writing, and the favour with which his contributions were regarded encouraged his choice and confirmed him in authorship. A more settled course of exertion was opened up for him in 1817, the year after he had passed as advocate, by the establishment of *Blackwood's Magazine*. Of this distinguished periodical he became, with John Wilson, the principal contributor; and now it was that the whole torrent of thought, which the bar may have kept in check, burst forth in full profusion. Eloquence, and wit, and learning distinguished his numerous articles, and imparted a prevailing character to the work which it long after retained; but unfortunately with these attractive qualities there was often mingled a causticity of sarcasm and fierceness of censure that engendered hatred and strife, and at last led to bloodshed. But into this painful topic we have no wish to enter; and the unhappy termination of his quarrel with the author of *Paris Visited* and *Paris Revisited*, may as well be allowed to sleep in oblivion. It is more pleasing to turn to his *Peter's Letters to his Kinsfolk*, a wonderful series of eloquent, vigorous, and truthful sketches, embodying the distinguished men, in almost every department, by whom Scotland was at that period distinguished above every other nation. Not a few, at the appearance of this his first separate work, were loud in their outcry against the author, not only as a partial delineator, but an invader of the privacies of life and character; but now that years have elapsed, and that the living men whom he so minutely depicted have passed away from the world, the condemnation has been reversed, and the resentment been superseded by gratitude. How could we otherwise have possessed such a valuable picture-gallery of the great of the past generation? All this Sir Walter Scott fully appreciated when he thus wrote to the author of *Peter's Letters* in 1819:—"What an acquisition it would have been to our general information to have had such a work written, I do not say fifty, but even five-and-twenty years ago; and how much of grave and gay might then have been preserved, as it were, in amber, which have now mouldered away! When I think that, at an age not much younger than yours, I knew Black, Ferguson, Robertson, Erskine, Adam Smith, John Horne, &c. &c., and at last saw Burns, I can appreciate better than any one the value of a

work which, like this, would have handed them down to posterity in their living colours."

It was in May, 1818, that Lockhart first formed that acquaintanceship with Sir Walter Scott which so materially influenced the course of his after-life. The introduction to the "Great Unknown" took place in Edinburgh, at the house of Mr. Home Drummond of Blair-Drummond, where a small but select party was assembled; and Scott, who understood that Mr. Lockhart had but lately returned from a tour in Germany, held with him an amusing conversation on Goethe and German literature. This introduction soon ripened into an intimacy, in which Miss Scott became a principal personage, as a marriage treaty, with the concurrence of all parties, was settled so early as the February of 1820. On the 29th of April the marriage took place at Edinburgh, and Sir Walter, who was the worshipper as well as recorder of good old Scottish fashions, caused the wedding to be held in the evening, and "gave a jolly supper afterwards to all the friends and connections of the young couple." Mr. Lockhart and his bride took up their abode at the little cottage of Chiefswood, about two miles from Abbotsford, which became their usual summer residence—and thither Sir Walter, when inundated by sight-seers and hero-worshippers, was occasionally glad to escape, that he might breathe in a tranquil atmosphere, and write a chapter or two of the novel that might be on hand, to despatch to the craving press in Edinburgh. These were happy visits, that spoke of no coming cloud; "the clatter of Sibyl Grey's hoofs, the yelping of Mustard and Spice, and his own joyous shout of *revellée* under our windows, were the signal that he had burst his toils, and meant for that day to 'take his ease in his inn.' On descending he was to be found seated with all his dogs and ours about him, under a spreading ash that overshadowed half the bank between the cottage and the brook, pointing the edge of his woodman's axe for himself, and listening to Tom Purdie's lecture touching the plantation that most needed thinning." By the year 1837 how completely all this had terminated! In the last volume of the *Life of Sir Walter Scott*, Lockhart thus closes the description: "Death has laid a heavy hand upon that circle—as happy a circle, I believe, as ever met. Bright eyes now closed in dust, gay voices for ever silenced, seem to haunt me as I write.

She whom I may now sadly record as, next to Sir Walter himself, the chief ornament and delight at all those simple meetings—she to whose love I owed my own place in them—Scott's eldest daughter, the one of all his children who in countenance, mind, and manners most resembled himself, and who indeed was as like in all things as a gentle innocent woman can ever be to a great man, deeply tried and skilled in the struggles and perplexities of active life—she, too, is no more." In December, 1831, John Hugh Lockhart, the Master Hugh Littlejohn of the *Tales of a Grandfather*, died, and in 1853 Lockhart's only surviving son, Walter Scott Lockhart Scott, leaving no remains of the family except a daughter, Charlotte, married in August, 1847, to James Robert Hope-Stuart, who succeeded to the estate of Abbotsford. In this way the representatives of both Sir Walter Scott and John Lockhart have terminated in Monica, the only surviving child of Hope-Scott of Abbotsford.

Leaving this domestic narrative, so full of happiness, disappointment, and sorrow, we gladly turn to the literary life of John Gibson Lockhart. After the publication of *Peter's Letters*, his pen was in constant operation; and notwithstanding the large circle of-acquaintance to which his marriage introduced

him, and the engagements it entailed upon him, he not only continued his regular supplies to *Blackwood's Magazine*, but produced several separate works, with a fertility that seemed to have caught its inspiration from the example of his father-in-law. The first of these was *Valerius*, one of the most classical tales descriptive of ancient Rome, and the manners of its people, which the English language has as yet embodied. After this came *Adam Blair*, a tale which, in spite of its impossible termination, so opposed to all Scottish canon-law, abounds with the deepest touches of genuine feeling as well as descriptive power. The next was *Reginald Dalton*, a three-volume novel, in which he largely poured forward his reminiscences of student life at Oxford, and the town-and-gown affrays with which it was enlivened. The last of this series of novels was *Matthew Wald*, which fully sustained the high character of its predecessors. It will always happen in the literary world, that when a critical censor and sharp reviewer puts forth a separate work of his own, it will fare like the tub thrown overboard to the tender mercies of the whale: the enemies he has raised, and the wrath he has provoked, have now found their legitimate object, and the stinging censures he has bestowed upon the works of others are sure to recoil with tenfold severity upon his own. And thus it fared with Lockhart's productions; the incognito of their author was easily penetrated, and a thunder-shower of angry criticism followed. But this hostile feeling having lasted its time has died a natural death, and the rising generation, who cannot enter into the feuds of their fathers, regard these writings with a more just appreciation of their excellence. After a short interval Lockhart came forth in a new character, by his translations from the *Spanish Ballads*; and such was the classical taste, melody of versification, and rich command of language which these translations evinced, that the regret was general that he had not been more exclusively a poet, instead of a student and author in miscellaneous literature. His next productions were in the department of biography, in which he gave an earnest of his fitness to be the literary executor and historian of his illustrious father-in-law—these were the *Life of Robert Burns*, which appeared in *Constable's Miscellany*; and the *Life of Napoleon Bonaparte*, which was published in *Murray's Family Library*.

The varied attainments of Mr. Lockhart, and the distinction he had won in so many different departments of authorship, obtained for him, at the close of 1825, a situation of no ordinary responsibility. This was the editorship of the *Quarterly Review*, the great champion of Toryism, when the political principles of Toryism were no longer in the ascendant, and which were now reduced to a hard battle, as much for life itself as for victory and conquest. It was no ordinary merit that could have won such a ticklish elevation at the age of thirty-two. Lockhart gladly accepted the perilous honour, linked, however, as it was with the alternatives of fame and emolument; and for twenty-eight years he discharged its duties through the good and evil report with which they were accompanied. In his case, as might be expected, the latter prevailed, and the angry complaints of scarified authors were loudly swelled by the outcries of a political party now grown into full strength and activity. With the justice or the unreasonableness of these complaints we have nothing to do; but it speaks highly for the able management of Lockhart, that in spite of such opposition, the *Review* continued to maintain the high literary and intellectual character of its earlier years. During

the latter years of his life his health was greatly impaired; but for this his intellectual exertions, as well as family calamities and bereavements, will sufficiently account. In the summer of 1853 he resigned his editorship of the *Quarterly Review*, and spent the following winter in Italy; but the maladies under which he laboured, although assuaged for a time, came back with double violence after his return home, and he died at Abbotsford, which had become the seat of his son-in-law, on the 25th of November, 1854.

Although not directly enumerated in the list of his authorship, the ablest, the widest known, and probably the most enduring of all Lockhart's productions, will here naturally occur to the mind of the reader. Who, indeed, throughout the whole range of educated society, has failed to peruse his *Life of Scott*, or will forget the impressions it produced? But even here, too, the angry objections with which *Peter's Letters to his Kinsfolk* was encountered, were revived with tenfold bitterness, and the charges of violated confidence, unnecessary exposure, or vain-glorious adulation, were raised, according to the mood of each dissatisfied complainer. But could a more perfect and complete picture of the whole mind of Sir Walter Scott, in all its greatness and defects, have been better or even otherwise produced?

LOCKHART, SIR WILLIAM, of Lee, an eminent statesman under the protectorate of Cromwell, was the third son of Sir James Lockhart of Lee, by Martha, daughter of Douglas of Mordington. He was born in the year 1621, and received the earlier part of his education in Scotland, whence he proceeded to some one of the usual seminaries in Holland. He did not long remain in that country, but after visiting Scotland for a short period, joined the French army as a volunteer, and so far distinguished himself as to attract the attention of the queen-mother, who procured for him a pair of colours.¹ He subsequently accompanied Lord William Hamilton to Scotland, and accepted the appointment of lieutenant-colonel in that nobleman's regiment.

In the course of his military duty he was introduced to Charles I., at his surrender to the Scottish army before Newark. He was on this occasion knighted, and was afterwards employed to negotiate for the safety of the Marquis of Moreton. Having joined in the enterprise of the Duke of Hamilton called the Engagement, he was taken prisoner in the unfortunate action at Preston, and, after remaining a year in custody at Newcastle, regained his liberty at the serious cost (at that period) of £1000. Having attached himself to the house of Hamilton, he necessarily attracted the jealous notice of the rival nobleman Argyle, and on several occasions subsequent to the arrival of Charles II. in Scotland, suffered, through its influence, a degree of contumely from the king, which roused his haughty spirit to exclaim that "No king upon earth should use him in that manner." But while he did not conceive that he should suffer the insults of a king with more patience than those of any other man, his private feeling towards the nominal head of the government did not interfere with his duty to his country, and his services to the cause he had adopted as the best. He remained an officer in Charles' army, and his regiment was distinguished for its services at the battle of Worcester. The cause of monarchy being now suppressed in both ends of the island, he remained for two years in retirement; but weary of keeping in dormancy powers which he was aware might distin-

guish him in the service of the state, he repaired to London, and was welcomed by the Protector, who never permitted a man of Lockhart's powers to remain unwillingly idle. From which side the advances were made appears not to be known; it was probably from that of Lockhart. This step is the more surprising as he had belonged to that party of the Scottish Presbyterians which used to regard monarchy with most respect. On the 18th of May, 1652, he was appointed one of the commissioners for the administration of justice in Scotland, and in 1654 the Protector gave him one of his nieces in marriage,² and raised him to the possession of the highest political influence in the land. In 1654 and 1656 he represented the shire of Lanark in Cromwell's parliaments. He was also appointed one of the trustees for disposing of the forfeited estates of the royalists, and a member of the Protector's privy-council for Scotland.

On the 14th December, 1655, he was appointed ambassador from England to Louis XIV.; a duty which, at that dangerous period, when the British government was acknowledged abroad only from its strength, was eminently calculated to bring out the peculiar energies of his mind. He did not proceed on his mission until April, 1656;³ a circumstance which probably accounts for his having sat for Lanark during that year. The character both of the government and its servant quickly secured respect. "He was," says Clarendon, "received with great solemnity, and was a man of great address in treaty, and had a marvellous credit and power with the Cardinal Mazarine."⁴ His countryman Burnet, who probably knew him better, says, "He was both a wise and gallant man, calm and virtuous, and one that carried the generousities of friendship very far. He was made governor of Dunkirk and ambassador at the same time. But he told me that when he was sent afterwards ambassador by King Charles, he found he had nothing of that regard that was paid him in Cromwell's time."⁵ He arrived at Dieppe on the 24th of April, and was received with all the civic honours which the town could bestow.⁶ An alliance with France in opposition to Spain, and indeed anything resembling amity towards the former nation, was considered an anomaly in the British constitution, resembling an infraction of the laws of nature, and the measure, although it was boldly undertaken and successfully executed, has met the reprobation of historians, whose simple statement of its impolicy and folly is embraced in the terms, "An alliance between Great Britain and France." But the union was an act of almost diplomatic necessity on the part of the Protector, from the alliance (as it was termed) of Spain with the exiled Charles; and with

² Harding calls the niece "Robina Sewster." Noble thinks the lady whom Lockhart married was probably a daughter of Desborough, because Secretary Thurloe writes to Lockhart, "H. H. (the Protector) do very much rejoice to hear that your lady is in a way of recovery, and so doth General Desborough, and truly no more than yours," &c.—*House of Cromwell*, ii. 256.

The following passage from the same source is perhaps more conclusive:

COLONEL LOCKHART TO SECRETARY THURLOE. "When I had the honour to take leave of you, I had your permission to give you trouble in any business wherein I was concerned; therefore being engaged by articles of agreement with General Desbrowe to make a purchase in England for a settlement to my wife and her children, and the daie being elapsed, by which time I was bound either to make a purchase, or to secure so much money by way of mortgage upon land in England, I am bound to beseech you to move his highness for leave to me for a month to come to London for settling that affair," &c. Edinburgh, December 25th, 1655.—*Thurloe's State Papers*, iv. 342.

³ *Thurloe*, iv. 647, 728.

⁴ Burnet's *Own Times*, i. 76.

⁵ *History*, vii. 180.

⁶ *Thurloe*, iv. 739.

¹ Harding's *Biographical Mirror*, iii. 54.

whatever reluctance the French may have at first looked upon the novelty, Mazarine found himself associated with a government whose assistance was useful, and whose enmity might be dangerous.

From the influence of the clergy alone was any opposition to be dreaded. "I have received," says the ambassador, "many civil messages from persons of honour and good interest; and I fynd also that my being here is much dislyked by others, especially by the assembly of the clergy. And," he continues, in the manner of the period, "I shall make it my endeavour to wait upon God for his directione and protectione, and shall verie little trouble myself with their menaces." But Lockhart found that the French were at least lukewarm in assisting the vast designs of Cromwell, and that they were naturally averse to be the mere auxiliaries of their natural enemies, in subjecting those neighbouring provinces which had often called forth the full power of their armies.

Lockhart accordingly takes many occasions to express the discontent of his energetic temper at the interruptions thrown in his way. Alluding to the cardinal's conduct about the dispute which then divided France, he says, "So soon as I have the opportunity of being at court, I shall endeavour to inform myself as fully as shall be possible for me, of what hath passed in this particular; and if I find that the differences betwixt the cardinal and the prince are in any good way of accommodatione, I shall then persuade myself that the cardinal (whatever pretences he hath had to the contrary) intends a peace with Sayne in good earnest, and hath got over the greatest rub that was in his way: for in his discourses on that businesse, I found that the restoration of the prince stuck more with him than either the re-delivery of towns, or the leaving of his allye the Portugal, to the Spanyard's mercy."¹ And, probably under the irritation of delay, he wrote to Secretary Thurloe in June, saying, "I beg leave to discharge my conscience, by letting you know that I am verie much convinced that his highnesse affairs here doe infinitelie suffer by mismanagement. They doe require the addresse of a hande muche more happie than myne; and therefore shall humbly beg, that you may be pleased to lett his highnesse knowe how much it concerns his interest heare that some other person be employed, whose parts and experience may be more suitable to this trust than myne are."² But Lockhart did not either give up his commission in discontent, or submit to be dallied with. Towards the termination of the year, he says in his despatches, "the audience my last told you I demanded and was promised, hath been defered till this evening, notwithstanding my endeavours to the contrary: and though it lasted from six o'clock at night till ten, yet I cannot say I had much satisfaction in it, for Mons. De Lion was with his eminence all the tyme, and by his presence necessitated my sylence in some particulars, that, if I had had the honour to entertain the cardinal by himself, I durst have ventured upon. Howsoever, finding several particulars, formerly agreed upon, questioned, and others absolutely denied, I was guiltie of the rudenesse to tell his eminence that I did not understand such proceedere in businesse, and was astonished to meet so unexpected changes."³ From remonstrances the ambassador proceeded to threats. It was the determination of the English that Mardyke and Dunkirk should be taken and left in their hands; and in the commencement of the year 1657, "Lockhart," says Clarendon, "made such lively instances with the cardinal,

and complaints of their breach of faith, and some menaces that his master knew where to find a more punctual friend, that as soon as they had taken Montmedy and St. Venant, the army marched into Flanders; and though the season of the year was too far spent to engage in a siege before Dunkirk, they sat down before Mardyke, which was looked upon as the most difficult part of the work; which being reduced, would facilitate the other very much; and that fort they took, and delivered it into the hands of Reynolds, with an obligation 'that they would besiege Dunkirk the next year, and make it their first attempt.'"⁴

Lockhart's contests for the interests of Britain did not terminate after the capture of Mardyke: he accused the French of purposely leaving the town undefended, that the British might be compelled to raze the fortifications, and gain no advantage from their captures, while they weakened the enemies of France. He urged Turenne to proceed immediately to the siege of Dunkirk, then but ill defended, offering for the service 5000 veterans and 2000 recruits; but he had to wait until June, 1658, ere the design was put in practice. At this celebrated siege Lockhart commanded the British foot, with which he charged and routed those of Spain. "As to the siege of Dunkirk," says Lord Fouconberg, "by the little discourse I have had with the Duke de Creguy, Chevalier Grammont, and others, I find they infinitely esteeme my Lord Lockhart for his courage, care, and enduring the fatigue beyond all men they ever saw. These were their own words."⁵ When the fortifications had yielded to his efforts and those of his illustrious coadjutor Turenne, he found himself still perplexed by the interruptions of the French: that the possession of so important and long-hoped-for an acquisition should be left to foreigners, was humiliating; and whatever respect they paid to Cromwell's government, these might at least indulge the privilege of preventing their assistance from being so ample as it appeared. Almost unassisted, Lockhart was compelled with his small army immediately to put the place in a posture of defence, and complaining that he was "forced to buy the very pallisades of the Fort-Royall, otherwayes the French, notwithstanding any order the king and cardinal can give, would pull them out; and not only burn them, but pull down the earthen works in taking them out."⁶

After the siege Lockhart was visited by commissary Mandossi, a person who, under pretence of paying some debts which the Spanish army had incurred during the siege, acted as an emissary from the Marquis of Caracine, privately to discover the extent to which Lockhart might countenance an immediate treaty as the avenue to a peace; but the conquering general returned polite and haughty answers to the hints laid before him. He was appointed governor of Dunkirk, an office in which he was enabled to distinguish himself for his resolution and consistency; and he was employed as plenipotentiary at the treaty of the Pyrenees. After the accession of Richard Cromwell, and even during the uncertainty of the continuance of a protectoral government in England, Sir William Lockhart so far supported in his own person the influence of the commonwealth, that the interference of the exiled prince was disregarded by both the foreign powers. After the peace he visited England, and met with Monk, whom he found still apparently intent on the continuation of the protectorate. Being thus lulled into security, he returned to his foreign station, which he hardly reached when he heard rumours of the approaching

¹ *Thurloe*, v. 441.² *Ibid.* 120.³ *Ibid.* 574.⁴ *Hist.* vii. 212.⁵ *Thurloe*, vii. 151.⁶ *Ibid.* 173.

restoration of monarchy. When Monk first hinted that his exertions would be at the service of the king, and advised him speedily to quit Spain, lest his person might be seized as a hostage for the restoration of Dunkirk, Charles fled to Breda; and Lockhart might at once have obtained pardon for all offences, and the prospect of high promotion under the new order of things, if he would have acceded to a request (made with many flattering promises) to throw open to him the gates of Dunkirk. But the man who had said he would not be insulted even by a king, answered that "he was trusted by the commonwealth, and could not betray it."¹ "This scruple," says Hume, "though in the present emergence it approaches towards superstition, it is difficult for us entirely to condemn;" but the elegant historian made the observation on the presumption that Lockhart "was nowise averse to the king's service." "Whether this refusal," says Clarendon, "proceeded from the punctuality of his nature (for he was a man of parts and of honour), or from his jealousy for the garrison, that they would not be disposed by him (for though he was exceedingly beloved and obeyed by them, yet they were all Englishmen, and he had none of his own nation, which was the Scottish, but in his own family); certain it is that, at the same time that he refused to treat with the king, he refused to accept the great offers made to him by the cardinal, who had a high esteem of him, and offered to make him marshal of France, with great appointments of pensions and other emoluments, if he would deliver Dunkirk and Mardyke into the hands of France; all which overtures he rejected: so that his majesty had no place to resort to preferable to Breda."² After the termination of the period of excitement and energy in which he bore so active a part, little of interest remains to be told connected with the events of Lockhart's life. He was of course deprived of the government of Dunkirk, which was bestowed on Sir Edward Harley. Through the intercession of Middleton he was suffered to return to Britain, and was introduced to Charles; he then retired to Scotland, where he buried himself in retirement, and amused himself with teaching his fellow-countrymen the English methods of agriculture; but, driven away by the prevailing anarchy, he preferred a residence with the relations of his wife, in Huntingdonshire. In 1665, when a renewed struggle of the commonwealth's men was expected in Scotland, the busy spirits who had dreamed of rather than concocted the enterprise, looked to the Earl of Cassillis and Lockhart as the individuals who would probably become their leaders; but neither countenancing the advances which were cautiously made, the project fell for a period. In 1671 he was brought to court by Lauderdale, and he showed no disinclination to be employed, "not so much," says Burnet, "out of ambition to rise, as from a desire to be safe, and to be no longer looked on as an enemy to the court." But Charles seems to have considered him as one of his "natural" enemies, "for when a foreign minister," continues Burnet, "asked the king leave to treat with him in his master's name, the king consented, but with this severe reflection, that he believed he would be true to anybody but himself." "He was sent," continues the same authority, "to the courts of Brandenburg and Lunenburg, either to draw them into the alliance, or, if that could not be done, at least to secure them from all apprehensions. But in this he had no success. And indeed when he saw into what a negotiation he was engaged, he became very uneasy.

For though the blackest part of the secret was not trusted to him, as appeared to me by the instructions which I read after his death, yet he saw whither things were going; and that affected him so deeply, that it was believed to have contributed not a little to the languishing he soon fell into, which ended in his death two years after." This event took place on the 20th March, 1675, a year after the death of his father. Noble has told us that his death was attributed to the alternate causes of "a poisoned glove," and disgust at the machinations betwixt Charles and Louis, of which he had been the unconscious instrument. "I have ever looked on him," says Burnet, "as the greatest man that his country produced in this age, next to Sir Robert Murray."

LOGAN, GEORGE, chiefly celebrated as the controversial opponent of Ruddiman, was born in the year 1678, and is supposed to have been the son of George Logan, a descendant of the family of Logan of Logan in Ayrshire, who married Miss Cunningham, a daughter of the clergyman of Old Cumnock, and sister to Mr. Alexander Cunningham, professor of civil law in the university of Edinburgh towards the latter end of the eighteenth century.³ George Logan was educated at the university of Glasgow, of which he entered the Greek class in 1693, and became a Master of Arts in 1696. Being destined for the church, he was licensed as a preacher by the presbytery of Glasgow about the year 1702, and on the 7th of April, 1707, he was ordained a minister by the same presbytery, in pursuance of a popular call to the parish of Lauder, the ministry of which he obtained in preference to two other candidates, Mr. Stephen Oliver and Mr. George Hall. He remained at Lauder until the 22d January, 1719, when, in consequence of another call, which was unanimous on the part of the parishioners, he was appointed to the ministry of Sprouston, in the presbytery of Kelso. A second time inducements were held forth, which prompted him to change his sphere of duty, and on the 22d January, 1722, he was inducted as minister of Dunbar. Here he married his first wife, the sister of Sir Alexander Home of Eccles in the Merse, a lady who left him a son and daughter, both of whom survived him. His ministry appears to have secured much popularity, for advancement was again held forth to him; and on the 14th December, 1732, he was admitted one of the ministers of Edinburgh. He whose fame and fortune had been so much advanced by the popular voice, now published a treatise *On the Right of Electing Ministers*, and it may safely be presumed that the liberal opinions thus commenced, and continued through the rest of his life, were at least fostered by the influence which the exercise of a popular right had produced on his own fortune. It is probable that this tract was published just before his appointment to the charge in Edinburgh, being dated in the same year. When the act for bringing to punishment those connected with the Porteous mob, in 1736, was ordered to be read in all the churches, on the last Sunday of every month during a year, "all the ministers," says Mr. Chalmers, rather enigmatically, "did not think with Logan that the will of the legislature ought, on this occasion, to be obeyed. And he was carried, by the activity of his temper, into a contest, in 1737, with the Rev. Dr. Alexander Webster, one of the ministers of Edinburgh, on the propriety of refusing obedience to an act of parliament, in a point wherein it is not easy to perceive how either conscience or religion could be concerned." On the 8th of May, 1740,

Logan was appointed moderator of the General Assembly. During the occupation of Edinburgh by the Highlanders, in 1745, Logan, in common with most of the other ministers of Edinburgh, thought it prudent to secure his personal safety by quitting the town. His house being near the weigh-house, where the Highlanders had a guard to prevent communication between the city and castle, was occupied by them as a guard-house. After their retirement he inserted in the newspapers an advertisement for the recovery of some articles abstracted by his late guests, a document containing more satire upon the Tory party than his political pamphlets. His controversy with Ruddiman originated in the edition of Buchanan's works edited by that eminent scholar in 1715. He had become a member of a society of critics, whose ostensible purpose was to rescue the memory of Buchanan from the prejudicial opinions of his editor, but whose labours, though they appear to have reached a considerable extent of matter, were never published. In 1746 Logan published "*A Treatise on Government*;" showing that the Right of the Kings of Scotland to the Crown was not strictly and absolutely Hereditary;" and in 1747 he subjoined "*A Second Treatise on Government*;" showing that the Right to the Crown of Scotland was not Hereditary in the sense of Jacobites." The first answer he received was in an anonymous letter, written in a spirit of airy ridicule, and in July, 1747, appeared the graver discussion of the grounds of his opinions by Ruddiman. Logan, in company with many men who have supported liberal and enlightened political sentiments, had the misfortune to be more anxious to establish them on historical precedent than on their native merits, and the history of Scotland was peculiarly barren in ascertained facts for such a purpose. His principles appear to have been somewhat akin to those of Grotius, which admitted nothing in hereditary right but a continuation to the descendants of the permission given to their ancestor to govern. To show that the crown of Scotland did not descend though the Stewarts in a pure legitimate stream, he discussed the well-known subject of the legitimacy of Robert III., and the question, certainly at one time debatable, whether the Pretender was or was not the son of James II. The former of these points has now been pretty satisfactorily established by the labours of Innes, Hay, Stewart, and Ruddiman, and the latter is no longer a matter of doubt. But Logan is accused of having gone to other and more frail sources; a fabulous list of kings had been added to the number of the tenants of the Scottish throne by Boece and the other early chroniclers. Buchanan, if he did not know the list to be fabricated, knew the circumstances of the lives of these persons to rest on so unstable a foundation, that he found himself enabled to twist their characters to his theories. On the events connected with the reigns of these persons, Logan likewise comments; but after having done so, turning to the writings of Innes and Stillingfleet, he remarked—"But I shall be so good as to yield it to Lloyd, Stillingfleet, and Innes; but then let our Scottish Jacobites and the young Chevalier give over their boasting of hereditary succession by a longer race of kings in Scotland than in any kingdom in the known world."¹ Ruddiman employed his usual labour in clearing the questions about Robert III. and the birth of the Pretender; but in another point—the wish to prove that Robert the Bruce was a nearer heir to the Scottish crown by feudal usages than John Baliol—he failed. Chalmers, who can see neither talent nor honesty

in Logan, and no defect in Ruddiman, observes, that "it required not, indeed, the vigour of Ruddiman to overthrow the weakness of Logan, who laid the foundations of the government which he affected either on the wild fables of Boece, or on the more despicable fallacies of Buchanan;" but the fables, which were satirically noticed by Logan, were subjects of serious consideration to the grave critic. Ruddiman brings against his opponent the charge, frequently made on such occasions, of "despising dominions, speaking evil of dignities, and throwing out railing accusations against kings, though the archangel Michael durst not bring one against the devil himself, whom our author, I hope, will allow to be worse than the worst of our kings."² This was, at least, in some degree complimentary to Logan, and the critic, proceeding, tries to preserve for the ancestors of Charles II. both their length of line and their virtues, and is anxious to show that, at least, such as cannot be easily saved from the censures of Buchanan and Logan, were not lineal ancestors of the great Charles II. In point of philosophy, Ruddiman's work cannot well be compared with the several pamphlets of Logan, although even the arguments of the latter against divine right would now be considered too serious and uncalled for by any power of defence. The different pamphlets will be found accurately enumerated in Chalmers' *Life of Ruddiman*. Logan was the more restless and determined of the two, and continued his attacks until 1749, when both had reached a period of life fitted for more peaceful pursuits. Logan died at Edinburgh on the 13th of October, 1755, in the seventy-seventh year of his age.

LOGAN, JOHN, a poet and sermon writer of no mean eminence, was born in the year 1748, at Soutra, in the parish of Fala, in the county of Mid-Lothian, being the son of George Logan, a small farmer at that place of the Dissenting persuasion. He received the elements of learning at the school of Gosford, in East-Lothian, to which parish his father removed during his childhood. Being the younger of two sons, he was early destined to the clerical profession, according to a custom not yet abrogated in families of the humbler rank in Scotland. At the university of Edinburgh he formed an acquaintance with the unfortunate Michael Bruce, and also with Dr. Robertson, afterwards minister of Dalmeny, and known as author of a life of Mary Queen of Scots. In the society of the former individual he cultivated poetical reading and composition, being fondest, as might be supposed from the character of his own efforts, of the writings of Spenser, Collins, Akenside, and Gray, the three last of whom bear so honourable a distinction from the cold and epigrammatic manner of their contemporaries. During one of the recesses of the college, while residing in the country, he became known to Patrick Lord Elibank, who, with his usual enthusiasm in favour of genius of every kind, warmly patronized him.

On completing his education Logan was received as tutor into the house of Mr. Sinclair of Ulbster, and thus became preceptor of Sir John Sinclair, author of the *Code of Agriculture*. He did not long retain this situation, in which he was succeeded by his friend Robertson. In 1770 he superintended the publication of the first edition of the poems of Bruce, who had died three years before. The volume professedly contained a few supplementary pieces by other writers, and of these Logan was himself the principal author. The best of his con-

² *Ruddiman's Answer*, 27.

tributions was the "Ode to the Cuckoo," which, notwithstanding the obvious fault of a want of connection between the various parts of various stanzas, is still one of the most popular poems in the language.

In 1773 Logan was licensed as a preacher by the presbytery of Edinburgh, thus joining the ranks of the Established instead of the Dissenting church. He soon became known as an eloquent and affecting preacher, and in the same year was called by the kirk-session and incorporations of South Leith to be their minister; a situation always considered as one of the most honourable in the Church of Scotland, and which had just been vacated by another man of genius, Dr. Henry Hunter, whose life has been given in the present work. Here he continued to cultivate literature with devoted ardour, though it was not till 1781 that he thought proper to publish any poetry under his own name. Among the studies of Dr. Logan, history was one of those in which he most delighted. In the winter of 1779 he delivered a course of lectures on the "Philosophy of History," in St. Mary's Chapel, Edinburgh, under the countenance and approbation of Drs. Robertson, Blair, Ferguson, and other eminent persons connected with the university. So successful was he in these exhibitions, that on the chair of universal history becoming vacant in 1780, he would unquestionably have obtained it, if he had possessed the incidental qualification of being a member of the Scottish bar. In the succeeding year he published an analysis of his lectures, so far as they related to ancient history, under the title of *Elements of the Philosophy of History*, which was followed by one of the lectures *On the Manners and Government of Asia*. His poems, published in 1781, attracted so much attention, that a second edition was called for next year. In this collection he reprinted several of the pieces which he had formerly given to the world along with those of Michael Bruce. A painful charge rests against his memory regarding the real authorship of some of those pieces, and also respecting the use he made of a copious manuscript of Bruce's poetry intrusted to him after the publication of the first volume. Into this controversy, which is fully stated in Anderson's edition of the *British Poets*, we deem it unnecessary to enter; but we can state, as a fact not formerly known to the biographers of Logan, that he asserted his innocence in a very decided manner, after his removal to London, by ordering an Edinburgh agent to take out an interdict against an edition of Bruce's *Poems*, in which several of his own pieces had been appropriated, under the supposition of their belonging to that poet.

Undeterred by the fate of Home, Logan produced a tragedy in 1783. It was entitled *Runnimede*, and aimed at combining the history of Magna Charta with a love-story said to be expressly borrowed from the *Tancrède* of Voltaire. *Runnimede* was rehearsed by Mr. Harris at Covent Garden Theatre, but prevented from being acted by an order from the chamberlain, who, in the recent feeling of the American war of independence, took alarm at several of the breathings in favour of liberty. Logan then printed it, and had it acted in the Edinburgh theatre; but in neither form did it meet with decided success. This, with other disappointments, preyed upon the spirits of the poet, and he now betook himself to the most vulgar and fatal means of neutralizing grief. It is to be always kept in mind that his father had died in a state of insanity, the consequence of depressed spirits. Hence it is to be presumed that the aberrations of the unhappy poet had some palliative in constitutional tendencies. From whatever source

they arose, it was soon found necessary that he should resign the charge of the populous parish with which he had been intrusted.¹ An agreement to this purpose was completed between him and the kirk-session in 1786, and he retired with a certain modicum of the stipend, while Mr. Dickson was appointed his assistant and successor.

In the autumn of the preceding year Logan had proceeded to London, apparently with the design of devoting himself entirely to literature. He was engaged in the management of the *English Review*, and compiled a view of ancient history, which passed under the name of Dr. Rutherford. In 1788 he published an anonymous pamphlet, entitled *A Review of the Principal Charges against Mr. Hastings*; which, being construed into a breach of the privileges of the House of Commons, caused a prosecution of the publisher Stockdale, who, however, was acquitted. This was the last production he gave to the world. After a lingering indisposition he died in London, December 28, 1788, about forty years of age.

Dr. Logan destined legacies to the amount of £600 to certain of his friends and relations, to be realized out of his books and manuscripts. The latter consisted of sermons, miscellaneous prose pieces, lectures, and a few small lyrical poems. In 1790 the first volume of the sermons was published, under the superintendence of Drs. Robertson, Hardy, and Blair. The second volume appeared in the following year; and, before the end of 1793, both volumes had undergone a second impression. None of his other posthumous works have been published.

Except in the latter part of his life, when rendered irritable and sottish by the results of his constitutional temperament, Dr. Logan is allowed to have been a man of the most amiable character, full of refined sensibility, and free from all mean vices. Of his poetry, which has been several times reprinted in the mass, it is no small praise to say that it advances before the age in which it was written, having more of the free natural graces which characterize modern verse, than the productions of most of his contemporaries. It is also characterized in many instances by singularly happy expressions, as it is in general by extreme sweetness of versification. His "Ode to the Cuckoo" and his hymns are the pieces which may be expected to last longest. A selection from the latter, omitting portions of some of those chosen, was embodied in the volume of paraphrases sanctioned by the Church of Scotland as an addition to the psalmody. "The sermons of Logan," says his earliest biographer, Dr. Anderson, "though not so exquisitely polished as those of Blair, possess in a higher degree the animated and passionate expression of Massillon and Atterbury. His composition is everywhere excellent—its leading characteristics being strength, elegance, and simplicity. The formation of his sentences appears the most inartificial; though, at the same time, it will be found strictly correct. But the manner, amidst all its beauties, is, on the first perusal, lost in the enjoyment the reader feels from the sentiment. Devotional and solemn subjects peculiarly accord with his feelings and genius. In exhibiting deep and solemn views of human life, his sentiments are bold and varied, and

¹ An aged parishioner of Dr. Logan mentioned to a friend of the editor of this work, that he was present in church one day, when the conduct of the reverend gentleman was such as to induce an old man to go up, and, in no very respectful language, call upon the minister to descend from the pulpit which he disgraced. Such an anecdote, if read immediately after perusing one of the elegant discourses of Logan, would form a singular illustration of the propinquity which sometimes exists between the pure and impure, the lofty and the degraded, in human character.

his imagination teems with the most soothing and elevated figures. . . . It appears to have been no part of his plan to seek out for new subjects of preaching, or to exert his ingenuity in exhibiting new views of moral and religious topics. To embellish the most common subjects, which are certainly the most proper and useful, with new ornaments—to persuade by more forcible and captivating illustration—to unite the beauties of elegant diction and the splendour of fine imagery—in this lay his chief exertions, and here rests his chief praise.”

LOTHIAN, DR. WILLIAM, F.R.S.E., author of a *History of the United Provinces of the Netherlands*, was born at Edinburgh in 1740, being the son of Mr. George Lothian, a respectable surgeon in that city. Having passed through the various stages of his education with some éclat, he was licensed as a preacher of the gospel in 1762, and appointed in 1764 one of the ministers of the Canongate. As a preacher his method of instruction was simple and perspicuous, his sentiments rational and manly, and his manner unaffected and persuasive. For many years before his death he was afflicted with a very painful disease; yet he not only performed his professional duties with unabated zeal, but found energy and spirit to compose the work above-mentioned, which appeared in 1780. Previously to this publication he had been honoured by the Edinburgh university with the degree of Doctor of Divinity. He died December 17, 1783, having only completed the forty-third year of his age. Two sermons by him are published in the *Scotch Preacher*, 4 vols. 12mo, 1776. For a more copious notice of this respectable divine, reference may be made to the first volume of the *Transactions of the Royal Society of Edinburgh*.

LOUDON, JOHN CLAUDIUS. This eminent improver of our gardening and agriculture was born at Cambuslang, Lanarkshire, on the 8th of April, 1783. His father was a respectable farmer, who resided at Kerse Hall, near Gogar, in the neighbourhood of Edinburgh: his mother was only sister of the mother of Dr. Claudius Buchanan, so well known by his philanthropic labours in behalf of the Hindoos, and his work entitled *Christian Researches in Asia*. Even when a child, John Claudius Loudon evinced that taste in gardening for which he was afterwards so distinguished; and his chief pleasure at that time was to lay out and make walks and beds in a little garden which his father had given him. He was early sent to Edinburgh for the benefit of his education, where he resided with his uncle; and besides studying botany and chemistry, he learned Latin, and afterwards French and Italian, contriving to pay the fees of his teachers by the sale of his translations from the two last-mentioned languages. Being placed at the age of fourteen under the charge of a nurseryman and landscape-gardener, he continued his studies in botany and chemistry, to which he added that of agriculture, at the university of Edinburgh; while, to obtain as much time as possible from the duties of the day, he was wont to sit up two nights during each week, a practice that grew into a habit, and which he continued for years during his subsequent studies.

In 1803, when he had now reached his twentieth year, and obtained a considerable reputation in landscape-gardening, Loudon went up to London, carrying with him numerous letters of introduction to some of the first landed proprietors in England. On entering the great metropolis the tasteless manner in which the public squares were laid out caught his observant eye: their gloomy trees and shrubs were

planted as if the places had been designed for churchyards rather than haunts of recreation. As the solitary voice of a stranger would have been unheard upon such a prevalent evil, he had recourse to the press, and published an article, entitled “Observations on Laying out the Public Squares of London,” in the *Literary Journal*, in which he recommended the oriental plane, almond, sycamore, and other lighter trees, instead of the lugubrious plantings that had hitherto been in vogue. The advice gradually prevailed, and the effect is to be seen in the cheerful, graceful aspect of our public squares in London, as well as over the kingdom. He now became an author as well as practical workman, and his pen went onward with little intermission for forty years, until his life terminated. His first publication, which appeared in 1804, was entitled *Observations on the Form, Situation, and Management of Urban and Suburban Plantations*. In the following year he published *A Short Treatise on the Management of Hot-houses*; and in 1806 “*A Treatise on Forming, Improving, and Managing Country Residences*; and on the Choice of Situations appropriate to every Class of Purchasers.” As Loudon was an excellent artist, this work was enriched with thirty-two copperplate engravings of landscape scenery, drawn by himself.

A disaster which soon after befell him, and under which the activity of others would have been paralyzed, only opened up for Loudon a wider range of action. In consequence of travelling upon a rainy night on the outside of a coach, and neglecting afterwards to change his clothes, so severe an attack of rheumatic fever ensued that he was obliged to take lodgings at Pinner, near Harrow. Here, during the days of convalescence, he had an opportunity of observing the cumbrous, wasteful, and unskilful modes of farming pursued in England, and so much at variance with those which were beginning to be put in practice in his own country. With Loudon to see an evil was to labour for its removal, and persist until it was removed. For the sake of giving practical illustrations of his proposed amendments, he induced his father to join with him in renting Wood Hall, near London, where their operations were so successful, that in 1807 he was enabled to call public attention to the proof, in a pamphlet entitled “*An Immediate and Effectual Mode of Raising the Rental of the Landed Property of England, &c.*,” by a Scotch Farmer, now farming in Middlesex.” This excellent work introduced him to the notice of General Stratton, by whom he was induced to farm Tew Park, a property belonging to the general in Oxfordshire. On moving to this new locality Mr. Loudon did not content himself with reaping the fruits of his superior farming; anxious that others should share in the benefit, he established an academy or college of agriculture on the estate of Tew Park, where young men were instructed in the theory of farming and the best modes of cultivating the soil; and, anxious to diffuse this knowledge as widely as possible, he published, in 1809, a pamphlet, entitled “*The Utility of Agricultural Knowledge to the Sons of the Landed Proprietors of Great Britain, &c.*,” by a Scotch Farmer and Land-agent.”

In this way, while Loudon was generously doing his uttermost to be the Triptolemus of England, and teaching the best modes of increasing and eliciting the riches of its soil, his own success was a practical comment upon the efficacy of his theories; for, in 1812, he found himself the comfortable possessor of £15,000. This was enough for one who had a higher aim in life than mere money-making, and to fit himself more effectually for that aim, he resolved

to improve his mind by travel. Accordingly, he resigned his profitable farm, and in March, 1813, commenced his travels on the Continent, visiting the principal cities of Germany and Russia. Short though this tour was, for he returned to England in the following year, it was associated with a variety of interesting adventures, of which he published a full account, illustrated by sketches from his own pencil. On returning to London he found that the greater part of his property had disappeared, from the faithlessness of the investments to which it had been intrusted, and thus he had to begin the world anew. He returned to his original occupation, that of landscape-gardening, on which he resolved to produce an extensive work; and for the improvement of his knowledge on this subject he made, in 1819, a tour of France and Italy. Three years after the work appeared, under the title of the *Encyclopædia of Gardening*; and such was the high reputation it acquired, that its author was reckoned the first horticulturist of his day. Of this work a second edition appeared in 1824, containing great alterations and improvements. Encouraged by the success that attended it, Loudon commenced another equally copious, and upon the same plan, which appeared in 1825, entitled the *Encyclopædia of Agriculture*. In 1826 he commenced the *Gardener's Magazine*, the first periodical that had ever been devoted to horticultural subjects. In 1828 he commenced the *Magazine of Natural History*, which was also the first periodical of the kind. In 1829 he published the *Encyclopædia of Plants*, which was less his own work than any of its predecessors, as he claimed nothing of it beyond the plan and general design. During the two years that followed he was chiefly employed in producing new editions of his *Encyclopædias of Agriculture and Gardening*, and of these, the first was almost wholly re-written, and the latter entirely so. But these occupations, although so laborious, were not his sole nor even his chief task at the time, for he was also closely engaged with the *Encyclopædia of Cottage, Farm, and Villa Architecture*—so closely, indeed, that himself and Mrs. Loudon used to sit up the greater part of every night employed upon it, never having more than four hours' sleep, and drinking strong coffee to keep themselves awake. It would have been hard, indeed, had such labour been in vain; and therefore it is gratifying to add, that this was not only one of the most useful, but also most successful, of all his works, and is still a standard authority upon the subject. His next, and also his greatest work, which would of itself have been sufficient for any ordinary lifetime, was his *Arboretum et Fruticetum Britannicum*, in which he gave an account, with pictorial illustrations, of all the trees, wild or cultivated, that grow in Great Britain. This production, which was published in 1838, at his own risk, was so unsuccessful, that after paying artists and other persons engaged in it, he found himself in debt to the amount of £10,000 to the printer, stationer, and wood-engraver, while the sale of such a splendid publication was so slow, that there was no prospect that it would ever pay its own expenses.

Up to this period Loudon had been one of the most prolific of authors, while all that he had written he had written well. Nothing, indeed, could exceed his indomitable resolution, unless it might be the philanthropic spirit by which it was animated. Independently of the subjects which we have enumerated, he wrote several minor productions, supplemented his own works from time to time, and was a contributor to Brande's *Dictionary of Science*. Even, also, while the pressure of these numerous avocations was at the greatest, he was discharging

the office of editor to four separate periodicals, all of them established by himself, and which he superintended at one and the same time. All this suggests the idea of a frame of iron and a constitution impervious to human weaknesses and wants, as well as the most unflinching energy of purpose. But our wonder is heightened when we find that, during the greater part of these labours, poor Loudon was an invalid and a cripple. The rheumatic fever with which he was attacked in 1806 ended in an ankylosed knee, and a contracted left arm. Thus he continued till 1820, when, while employed in compiling the *Encyclopædia of Gardening*, he had another severe attack of rheumatism, that compelled him to have recourse in the following year to Mohammed's Baths at Brighton. Here he submitted to the rough process of shampooing; but this remedy, so available in many cases like his own, was too much for his feeble bones: his arm broke so close to the shoulder, that it could not be set in the usual manner; and in a subsequent trial, it was again broken, and this time so effectually, that in 1826 amputation was found necessary. But a general breaking up of the system had also been going on, by which the thumb and two fingers of the left hand had been rendered useless, so that he could only use the third and little finger. Yet though thus so maimed and mutilated as apparently to be unfit for anything but the sick-chamber or a death-bed, the whole energy of life seemed to rally round his heart, and he was as ready for fresh encounters as ever, so that his work went on unchecked and unabated; and when he could no longer write or draw, he had recourse to the services of the draughtsman and amanuensis.

We have already mentioned the ill success of Loudon's *Arboretum Britannicum*. This was the heaviest blow of all, and tended to accelerate the disease that terminated in his death; but still, come what might, he resolved that to the last he would be up and doing. Accordingly, as soon as the above-mentioned work was finished, in 1838, he began the *Suburban Gardener*, which was published the same year, and also his *Hortus Lignosus Londonensis*; and in the year following he published his edition of *Repton's Landscape Gardening*. In 1840 he undertook the editorship of the *Gardener's Gazette*, and in 1842 he published his *Encyclopædia of Trees and Shrubs*. During the same year he finished his *Suburban Horticulturalist*; and in 1843 appeared his last work, on *Cemeteries*. Disease in the lungs had been meanwhile going on for three months, from which he endured much suffering, until his life and labours were terminated together on the 14th of December, 1843, in the sixty-first year of his age. Few men have written so much under such depressing circumstances as John Claudius Loudon, or whose writings were so well adapted to the purpose for which they were produced; and while their practical character and utility have been universally acknowledged, they are pervaded throughout with an earnest desire to improve the character and elevate the standing of those classes whose occupations are connected with gardening and agriculture. Add to this that "he was a warm friend, and most kind and affectionate in all his relations of son, husband, father, and brother, and never hesitated to sacrifice pecuniary considerations to what he considered his duty."

We have already made a passing allusion in this memoir to Mrs. Loudon, by whose aid he was materially benefited when aid was most needed. To her he was married in 1831, and in her he found a fellow-student and literary co-operator, as well as a domestic companion and comforter. Her works,

which also were numerous, were chiefly connected with her husband's favourite departments of gardening and botany; and these she endeavoured to simplify and recommend to the attention of her own sex, a labour of love in which she was highly successful. She and one daughter survived Mr. Loudon, of whom she has written an affectionate and truthful biography.

LOVAT, LORD. See FRASER (SIMON).

LOVE, JOHN, a controversial critic of celebrity, was born at Dumbarton in 1695.¹ He was the son of John Love, a bookseller, who, as Chalmers indisputably remarks, "like greater dealers in greater towns, supplied his customers with such books as their taste required." The son was educated at the grammar-school of Dumbarton and the university of Glasgow. Having finished his studies, he became assistant or usher to his old master Mr. David M'Alpine, and in 1720 succeeded him in his humble duty. On the 17th October, 1721, he married Elizabeth, daughter of Mr. Archibald Campbell, a surgeon of Glasgow, who had been one of the bailies of that city. By her he had thirteen children, two of whom, a clergyman and an officer in the navy, were alive when Chalmers wrote his *Life of Ruddiman*. In 1733 Mr. Love entered the field of controversy by publishing *Animadversions on the Latin Grammar lately published by Mr. Robert Trotter, Schoolmaster of Dumfries*, a production chiefly designed for the purpose of defending Ruddiman, whose grammar had been reflected on by Trotter. "Like Ruddiman," says Chalmers very aptly, "Love seems to have been delighted in marriage, or like him, to have been driven to connubial connections by his scholastic business, which required female superintendence." Accordingly, in pursuance of the disposition so aptly associated with his name, he married in 1741, for his second wife, Giles, the youngest daughter of the Rev. Mr. James Elphinston, minister of Dalkeith, who had died in 1710. Love was subjected, it would appear, at one period of his life to a species of religious prosecution, on an accusation of brewing on Sunday, preferred before the church judicatories by Mr. Sydesr, minister of Dumbarton. It was a fearful charge in Sabbath-loving Scotland, where abstinence from all work on the first day of the week was so scrupulously observed; and had it been substantiated, Love would not only have lost his situation, but also his respectability in society. But the evil recoiled upon the head of his over-zealous accuser, and the minister, says Chalmers, "after a judicial trial, was obliged to make a public apology, for having maliciously accused calumniated innocence." In October, 1735, he was appointed one of the masters of the high-school of Edinburgh; and in 1737, with the assistance of Ruddiman and Robert Hunter, he edited a very handsome edition of the translation of the Psalms of Buchanan, which attracted the notice of the Duke of Buccleuch, and obtained for the editor in 1739 the rectorship of the grammar-school of Dalkeith—a situation which has for a long period been deemed of considerable importance, and very ably filled, but which would not now be considered an advancement from that which Love previously enjoyed. In the following year he engaged in the controversy about the respective merits of Johnston and Buchanan as translators of the Psalms, known by the name of *Bellum Grammaticale*, and already referred to in our memoir of ARTHUR JOHNSTON. He was of course the supporter of the work he had edited. "The conquests which

Love had made over Trotter and Lauder," says Chalmers, "probably gave him a fondness for controversy." In 1749 he published *A Vindication of Mr. George Buchanan*, a work levelled at the imputations of Camden on the one part, and the reflections of Ruddiman, his former friend, on the other. It says much for the candour of Love that Chalmers allows him to have been actuated by "honest zeal." The chief subject of discussion was the alleged penitence of Buchanan on his death-bed on account of his attacks on the character of Queen Mary. In July, 1749, in his old age, Ruddiman published an answer, termed *Animadversions on a Late Pamphlet entitled A Vindication of Mr. George Buchanan*. The venerable grammarian survived his opponent, who died on the 20th September, 1750, at the age of fifty-five. Chalmers admits that "he was certainly an eminent scholar, an excellent teacher, and a good man."

LOVE, REV. JOHN, D.D. This profound theologian and eloquent preacher, was born in Paisley, on June 4th, 1757. When only ten years of age he became a student of the university of Glasgow; and during the long career of study which he prosecuted at that ancient seat of learning, he distinguished himself by his classical attainments, and his proficiency in the several departments of mathematics. These studies he continued to the end of his life; and there are several yet living who can remember his happy facility in the quotation of Greek and Roman authors upon any subject of conversational intercourse. With the contents of Scripture, however, which formed his chief study, he was more conversant still; and even before he was twelve years old he had read the Bible, according to his own statement, six times over. A favourite practice, which he continued to the end of his life, was to write short daily meditations, in a regular series, upon connected passages of Scripture. These, as well as his sermons, were written in short-hand, and therefore unintelligible, until the key to his alphabet was found; and from this discovery several of his posthumous discourses were published, which otherwise would never have seen the light.

Having finished the appointed course of study at college, and undergone the usual trials of presbytery, Mr. Love was licensed as a preacher in 1778, being then only in his twenty-first year. Soon afterwards he was employed as assistant by the Rev. Mr. Maxwell, minister of Rutherglen, near Glasgow; in 1782 he was transferred to Greenock, where he officiated in the same capacity to the Rev. David Turner, minister of the west or old parish; and here he continued till the death of Mr. Turner in 1786. It will thus be seen that while Mr. Love had no church patron, or at least an efficient one, he had not that kind of popular talent which secures the greatest number of votes among town-councillors or seat-holders. His indeed was that superior excellence which can only be appreciated by the judicious few, and in consequence of a considerable acquaintance. After leaving Greenock, Mr. Love, toward the close of 1786, was called to the ministerial charge of the Scottish Presbyterian congregation in Artillery Street, Bishopsgate, London, and here he continued to labour for nearly twelve years. It was indeed no inviting field for one of his peculiar talents. His massive and profound theology—his sententious style of preaching, in which every sentence was an aphorism—and the very impressive but slow and almost monotonous voice in which his discourses were delivered—were not suited to the church-going citizens of London, who required a livelier manner and more buoyant style of oratory. From these causes, added

¹ Chalmers's *Autobiography*, i. 5.

to the ignorance of the English about Presbyterianism in general, and the tendency of the Scotch in London to forsake the church of their fathers, Mr. Love's place of meeting was but slenderly attended, while his name as a preacher was little known beyond its walls. One important work, however, was committed to the hands of Mr. Love, from which, perhaps, more real usefulness redounded than could have been derived from mere pulpit popularity. He was one of those honoured men who rolled away the reproach from Protestantism, as not being a missionary, and therefore not a genuine, church of Christ—a serious charge that had often been brought against it by the Papists—by his exertions and effective aid in founding the London Missionary Society. This occurred during the latter part of his residence in London. Often he afterwards reverted with delight to the fact of his having written the first circular by which the originators of this important society were called together, for the purpose of forming themselves into a directory, and organizing their plan of action; and when the society was embodied, he was very properly appointed one of its secretaries. One important duty which he had to discharge in this capacity was, to select the fittest agents for missionary enterprise over the newly-opened field of the South Sea Islands. Not resting satisfied with this onerous and somewhat critical duty, he endeavoured to qualify the missionaries for their trying office, by planning such a series of discourses upon the principal doctrines of revelation as he judged would be best fitted to persuade a primitive, simple-minded people, and which would serve as models, or at least as suggestions, for the use of the Christian teachers who were to be sent among them. With this view he wrote and published a volume, under the title of *Addresses to the Inhabitants of Otaheite*. It was a series of short discourses upon the chief and simplest points of Christian theology, and such as were thought best suited, by their earnest, impassioned style, to be addressed to the poetical children of nature, seated beneath the spreading shadow of their cedars, or around the genial glow of their council-fire. And eloquent indeed were these strange model discourses, and such as the Christian world—especially the young, who devoured them with delight and wonder—have seldom seen within the range of theological authorship. But little as yet were the South Sea islanders known, for whose behalf these sermons were written, and it was soon enough discovered that they were more prone to eat a missionary than to digest his doctrines. But that such ravening *anthrophophagi* should be changed into men, such be-sotted idolaters into Christians, and the principles of humanity, civilization, and order be established among them—and that, too, in the course of a single generation—was certainly the greatest, as well as the most encouraging achievement which modern missionary enterprise has yet accomplished. Mr. Love was permitted to witness the dawn of this bright morning of promise, after so deep a midnight of despondency; and he saw his poor Otaheiteans christianized, although the process had differed from his plans and anticipations.

In 1798 Mr. Love's official connection with London and the Missionary Society terminated, and two years afterwards he was called to the ministerial charge of a chapel of ease newly formed in Anderston, then one of the suburbs of Glasgow. He must have felt it a happy change from the echoes of the lonely walls in Artillery Street, to a populous city, in which his training for the ministry had commenced, and where he could find a congenial people by whom his worth would be fully appreciated. In Glasgow, accord-

ingly, he soon gathered a congregation, by whom he was enthusiastically beloved, and who rejoiced under his pastoral charge to the close of his valuable life. Here also he selected for his friend and chief companion the Rev. Dr. Balfour, of the High Church, Glasgow—of whom a memoir has been given in this work—a congenial spirit in learning, talent, piety, and apostolic zeal. Besides his labours in the pulpit, to which he brought all his powers of study and close application, as well as the resources of a singularly vigorous and richly endowed intellect, Mr. Love held the office of secretary of the Glasgow Missionary Society, and presided in its chief enterprise, the establishment of the mission to Caffraria. Notwithstanding his habitual reserve and dislike of popularity, his reputation as a scholar and theologian was so fully acknowledged, that in November, 1815, he was invited to be one of the candidates for the professorship of divinity, at that time vacant in King's College, Aberdeen. Mr. Love complied; but notwithstanding his fitness for the chair, which was tested by long trial and examination, the question was one not so much of ability and learning as of party feeling; and the Moderates being still in the ascendant were enabled to return a candidate of their own election. Soon afterwards Mr. Love was honoured with the degree of Doctor in Divinity. After this the quiet unostentatious course of the good man went on in its wonted tenor, until the cares and toils of the Caffre mission, already giving tokens of those dangers by which it was afterwards all but overthrown, tasked the sensitive spirit of Dr. Love for the last four years of his life, until December 17, 1825, when death terminated his anxieties, in the sixty-ninth year of his age.

It was as a pulpit orator that Dr. Love was best known and most highly appreciated in Glasgow, although his manner in the pulpit was such as seldom wins the popular favour. With little action, his utterance was slow, his countenance calm and even stern, and his voice deep and unchanged, except in some sudden burst of emotion that lasted only for a moment;—but even as such, there was a dignity in that mode of preaching which reminded the hearer of an ancient prophet rather than a modern minister, which compelled attention at the moment, and furnished matter for subsequent meditation. Such also was his bearing in everyday life, except when under some cheerful emotion, and then he could become the happiest of the gay and wittiest of the witty. These were glimpses of sunshine all the more delightful because they were only occasional and unexpected.

From his retiring spirit, that shrunk from popular distinction, and from the general state of his health, that agreed best with retirement and tranquillity, the authorship of Dr. Love has been limited, compared with his well-known talents and the wishes of his many admirers. During his own lifetime, indeed, he published nothing, as far as is known, except his *Addresses to the People of Otaheite*, and a few sermons. After his death, however, a careful research among his papers enabled his friends to give the following posthumous works to the world—deprived, however, of that careful correctness which his own revising pen would undoubtedly have bestowed on them:—1. A reprint of sermons preached by him on various public occasions; including also his Otaheitean Addresses. This volume was republished soon after Dr. Love's death. 2. Two volumes of sermons and lectures, from his unrevised manuscripts. These were published in 1829. 3. In 1838 was published a volume containing about three hundred of his letters. 4. In 1853 a volume containing thirty-four sermons, which

he preached in the West Church, Greenock, during the years 1784-5. Finally, in 1857-8 were published in two volumes 8vo, "*Memorials of the Rev. John Lowe, D.D.*," consisting of Diary, Reminiscences, and Original Papers. Edited by the Committee intrusted with the Charge of his Unpublished Papers."

LOW, GEORGE, an ingenious naturalist, was born at Edzel in Forfarshire, in the year 1746. He was educated at the universities of Aberdeen and St. Andrews, and afterwards was tutor in the family of Mr. Graham at Stromness in Orkney. During his residence at this place, Mr. (afterwards Sir Joseph) Banks and Dr. Solander arrived at the island, on their return from the last voyage of discovery, in which Captain Cook lost his life; and Mr. Low, having acquired a taste for natural history, was much noticed by these distinguished philosophers, and was requested to accompany them in their excursions through the Orkneys, and also to the Shetland Islands, which he accordingly did.

In 1774 he was ordained to the ministerial charge of the parish of Birsay and Staray, on the mainland of Orkney, to which he devoted the remainder of his life, employing his leisure in the study of nature. Considering the disadvantages of his situation, his success was highly creditable. Sir Joseph Banks, with his accustomed zeal for the promotion of science, introduced him to Mr. Pennant, by whose advice he engaged to undertake a *Fauna Orcadensis* and a *Flora Orcadensis*. Before these works could be given to the world, he died, in 1795. The MSS. of the former work, with his zoological collections, and the manuscript of a translation of Torfæus' *History of Orkney*, executed by Mr. Low, came into the possession of Mr. George Paton, the eminent antiquary, at whose decease they were sold to different persons. The *Fauna* was published in 1813, 4to, by W. F. Leach, M.D., F.L.S., and forms a very interesting addition to the natural history of the British Islands. The *Flora* has not been discovered. A tour through Orkney and Shetland, containing hints relative to their ancient, modern, and natural history, was also prepared for the press by this industrious individual, but, owing to his premature death, was never published.

LOWE, JOHN, a poet of considerable celebrity, though the author of only one small lyrical piece which has acquired popularity, was born at Kenmore in the stewartry of Kirkcudbright, in the year 1750. His father was gardener to Mr. Gordon of Kenmore, son of the unfortunate Viscount Kenmore; and young Lowe was reared to the business of a country weaver. Having, however, a strong desire of rising above his native lot, he fitted himself by his own exertions for entering an academical career at the university of Edinburgh, where his expenses were chiefly defrayed, it is said, by friends whom he had secured by his agreeable character and evident talents. While pursuing the study of divinity, he was engaged as family tutor by a country gentleman of his native district, Mr. M'Ghie of Airds. The residence of this gentleman, as partly implied by its Celtic appellation, was situate on a piece of lofty and picturesque ground, at the confluence of the Dee with the long narrow lake in which the Ken meets with that river. Lowe, already addicted to versification, rejoiced with a poet's ardour in the beautiful scenery of the Airds, amidst which he constructed an arbour, still called "Lowe's seat." He here composed a considerable number of poems, fragments of which are still recollected in the district; and here also he became attached to one of the beautiful daughters of his employer, who, it is to

be supposed, must have materially added to the inspiring powers of the scenery. His happy lyric, entitled *Mary's Dream*, but for which, in all probability, he never would have been heard of beyond his native district, was written at the Airds, in reference to the death of a gentleman named Miller, a surgeon, at sea, who was attached to the sister of his own mistress, and perished in the manner described in the poem.

Of the merits of this remarkable production it would now be superfluous to speak: it caught at once the popular favour, and retains it unimpaired to the present hour, so that we still hear the pathetic echo of "Mary, weep nae mair for me," in all its original tenderness. The knowledge of it also has been more widely spread in consequence of its appearing both in a Scotch and an English version, the former commencing with—

"The moon had climb'd the highest hill
Where eagles big aboon the Dee;"

while the latter less poetically begins with—

"The moon had climb'd the highest hill
That rises o'er the source of Dee;"

Of course the former version has obtained the preference, and is probably the form in which it was originally composed. Indeed, it is supposed, with considerable justice, that Lowe had no hand in the English version, and that the striking excellence of *Mary's Dream* obtained for it an English paraphrast, by which it became as popular in the south as in the north of our island. Another class of critics, however, have attempted to solve the difficulty, by supposing that Lowe wrote the song both in Lowland Scotch and in English.

It is not certain that Lowe, though he seems to have completed his theological studies, ever became a licentiate of the Scottish church. In 1773 he was induced to proceed to America, in order to become family tutor to a brother of the illustrious Washington. He subsequently set up a boarding academy at Fredericksburg in Virginia, which succeeded for a time, but afterwards failed. Before leaving Scotland, he had interchanged pledges of mutual love with Miss M'Ghie, and it was understood that their marriage should take place as soon as he should be properly settled in life. The lapse of years—distance—hopelessness, perhaps, of ever reaching the necessary degree of fortune, and not impossibly the intervention of seven years of war between the two countries, conspired to annul this engagement; and the parties eventually married different individuals in their respective countries. Lowe is charged by his biographers with glaring infidelity to his promise; but the case is too obscurely related to enable us to join in the censure which he has thus incurred. He eventually paid his addresses to a Virginian lady, who rejected them, but whose sister had conceived for him a violent affection, and whom he afterwards married, from a sentiment, as he expresses it, of gratitude. At what time this took place has not been stated by his biographer; but it is impossible, from the account given by that individual, to resist the impression that it was almost half a lifetime after his engagement at the Airds. His wife proved totally unworthy of his affections, and, by driving him for relief to the bottle, caused his death under the most miserable circumstances, about the year 1798. This succession of events appears from Mr. Gillespie's narrative to have been rapid: hence it is allowable to conjecture that at least twenty years must have elapsed between his parting with Miss

¹ The Rev. Mr. Gillespie, minister of Kelso, in Cromek's *Remains of Northumbrian and Scottish Song*.

M'Ghie and his unhappy union to another. If such was the case, we can hardly see how the most ardent impressions of youth could have been maintained at such a distance, and under the continued depression of circumstances on the part of the gentleman, which is acknowledged by the biographer, and which must have tended so much to make sick the hearts of both parties.

A letter from Virginia, from an early friend of the poet, gave the following particulars respecting his death:—"That perceiving his end drawing near, and wishing to die in peace away from his own wretched walls, he mounted a sorry palfrey, and rode some distance to the house of a friend. So much was he debilitated that scarcely could he alight in the court and walk into the house. Afterwards, however, he revived a little, and enjoyed some hours of that vivacity which was peculiar to him. But this was but the last faint gleams of a setting sun; for on the third day after his arrival at the house of his friend, he breathed his last. He now lies buried near

Fredericksburg, under the shade of two palm-trees; but not a stone is there on which to write, 'Mary, weep no more for me.'"

The wretched woman to whom he had been united made no inquiries after her husband for more than a month afterwards, when she sent for his horse, which had been previously sold to defray the expenses of the funeral.

Lowe is said to have been a very handsome man, of quick and lively apprehension, and very agreeable as a companion. His reputation as a poet has the strange peculiarity of resting on one small ballad. That, however, has melody, pathos, and imagery of no common character, and will probably be always reckoned among the happiest small pieces in the English language. Some fragments of his other compositions are given in Crome's *Remains*; but they do not rise one step above the cold second-rate pastoral epics of the period.

LYNEDOCH, LORD. See GRAHAM (THOMAS).
